For rapidity and thoroughness of work, the machine above illustrated is unequalled by any. It wastes no appreciable quantity of quicksilver, and is of itself a perfect settler. Fig. 1 represents the pan with a part of its side removed, and fig. 2 the screw muller, and its shoes. The letters *s* show the threads of the screw; *l*, its shoes, and *D* a low cylinder within which the screw rotates; *E*, represents open spaces through the base of the cylinder, and *F*, inclined partitions filling (at those points) the spaces between the cylinder and the shell of the pan. These inclined partitions are to intercept the current of pulp around the pan, as it issues from under the muller, and turn it toward the center again, over the screw. The dies are not shown in the figure—there are eight. Mercury is not ground, nor floured in this pan. The pulp is ground to a slum, with great rapidity; the muller is raised a little and the quicksilver is poured in *en masse*, forming a layer upon the bottom of the pan. The revolution of the screw then forces the pulp down into contact with the quicksilver, into which it is *effectually rubbed* by the shoes, while the screw, being constantly fed by the pulp from above it, presses all under the muller outward—still in contact with the quicksilver, through the spaces, *E*, and thence over toward the center of the pan, when it is again seized by the screw and forced down into the quicksilver, rubbed into and forced off in contact with it, which process is continued as long as desired. The pulp can thus be forced into contact with the mercury at the rate of 1,000 pounds in three minutes, or twenty times per hour, and none can escape contact with the mercury, that contact being under the immense pressure of the perpetual screw, in addition to that of gravity, which (gravity) is the only available force in the other pans for bringing the pulp into contact with the quicksilver. "A word to the wise is sufficient." The Screw Amalgamator is the cheapest and most efficient pan manufactured. Millmen! call and see one running at the Pacific Foundry. For particulars, address the inventor, H. A. GASTON, at Cosmopolitan Hotel, San Francisco; or R. L. THOMAS, Esq., Virginia City, Nevada. 1v14qr

By a combination of the movement of the ball and socket, and the movable arm, any desired angle may be obtained. Call and examine for yourselves. A liberal discount to the trade. SHEPARDSON & GATES, Agents, Corner Sansome and Commercial streets. 22v13-3m

## Rheumatism!!

Still Another Witness!

LATROUS, Cal., Sept. 19, 1866.

(White Oak Township, El Dorado Co.)

This is to certify, that I have, for over thirty-six years, been afflicted with Chronic and Inflammatory Rheumatism, and the sufferings and tortures I endured in consequence cannot be told. I have, at an expense of thousands of dollars, employed many physicians, both in this country and in Europe (where I was born and resided many years), among which were several eminent professors of medicine, and I experienced no benefit from their treatment, more than a slight and temporary relief.

About two years ago I was induced by some persons who had been cured by it to use Richard's Remedy for Rheumatism. It is enough to say that I was almost immediately relieved, and that I have not suffered with it since. I keep the medicine on hand, and, on the first approach of any returning symptoms, I take a few doses, which invariably put it to flight. I therefore cordially recommend it to the afflicted as an unfailing remedy for Rheumatism. FRED'K FABER.

25v13 RICHARDS' REMEDY is for sale by  
H. BOWMAN, Druggist, Sacramento,  
And by Druggists generally.

SAMUEL HILL,

General Agent, 111 Montgomery street, San Francisco.

17v13

**A SMART GIRL.**—Miss Fannie Paine, a miss only thirteen years of age, has, for about a year, performed the duties of paymaster in the Eagle Works Manufacturing Company at Chicago. In the last eight months of 1866, she paid out over \$250,000, keeping the time sheets, pay roll, and a private account book with each of 400 men employed in that establishment. She receives the money weekly from the bank, settles and keeps her balances with the cashier. She does this on a salary of \$625 per annum, currency. She also takes two music lessons each week, and attends regularly as a scholar in an evening Commercial College, after standing ten hours each day at her desk. Her health does not appear to be at all affected by her duties; she has never known a day of sickness.

**GASTON'S SCREW AMALGAMATOR.**—Chas. Foreman, Supt. of the Eclipse mine, Gold Hill, Nev., writes Mr. Gaston that the best feature of his pan is its "rapid grinding with little power." Messrs. Stiles & Stansfield, of Nevada City, Cal., pronounce it "A No. 1," as an amalgamator, and say that the loss of quicksilver is very slight.

**THE PACIFIC ASPHALTUM COMPANY** have purchased, says the Los Angeles News of the 15th instant, the brea mines, some six miles from this city. Men are getting out asphaltum for shipment to San Francisco. Several tons were shipped yesterday by the Orizaba.

**A PRIZE.**—A. H. Lee, a small grocer in Illinois, held the lucky ticket which recently drew, as a prize, the Chicago Opera House, worth \$600,000. It cost him a ten dollar greenback.

SOME bold character has predicted that some of the men who assisted in laying the Atlantic Cable, will live to see a tubular sub-marine railway along side of it.

**GAS.**—An abandoned oil hole in Erie, Pa., furnishes an abundant supply of gas for lighting and heating a manufacturing establishment in that neighborhood.

**BLASTING BY ELECTRICITY.**—The continuation of last week's article on this subject, promised for the present issue, will appear next week.

**CANARY BIRDS.**—Eighty thousand dollars worth of German canary birds were imported into the United States in 1866.

**TWELVE** thousand tons of sugar was produced in the Sandwich Islands in 1866.

**ZANTE CURRANTS**, better than the imported, are raised in Santa Clara county.

Issued by the United States or Foreign Countries, procured in the shortest time possible.

ENGRAVINGS FINELY EXECUTED.

## NATIONAL MINERAL LAND ACT.

Having received an authentic copy of this law, we reproduce it in our columns. Our former publication, however, was substantially correct:

SECTION 1. Be it enacted, That the mineral lands of the public domain, both surveyed and unsurveyed, are hereby declared to be free and open to exploration and occupation by all citizens of the United States, and that those who have declared their intention to become citizens, subject to such regulations as may be prescribed by law, and subject also to the local custom or rules of miners in the several mining districts, so far as the same may not be in conflict with the laws of the United States.

SEC. 2. And be it further enacted, That whenever any person or association of persons claim a vein or lode of quartz or other rock in place, bearing gold, silver, copper, or other mineral, having previously occupied and improved the same according to the local custom or rules of miners in the district where the same is situated, and having expended in actual labor and improvements thereon an amount of not less than \$1,000, and in regard to whose possession there is no controversy or opposition, it shall and they shall also post such notice in his office for claimants to file in the local land office a diagram of the same, so extended laterally or otherwise as to conform to the local laws, customs and rules of miners, and to enter such tract and receive a patent therefor, granting such mine, together with the right to follow such vein or lode, with its dips, angles and variations, to any depth, although it may enter the line of adjoining land, and adjoining shall be sold subject to this condition.

SEC. 3. And be it further enacted, That upon the filing of the diagram as provided in the second section of this act, and posting the same in a conspicuous place on the claim, together with a notice of intention to apply for a patent, the Register of the Land Office shall publish a notice of the same in a newspaper published nearest to the location of said claim, and shall also post such notice in his office for the period of ninety days; and after the expiration of said period, if no adverse claim shall have been filed, it shall be the duty of the Surveyor General, upon application of the party, to survey the premises and make a plat thereof, endorsed with his approval, designating the number and description of the location, the value of the labor and improvements, and the character of the vein exposed; and upon the payment to the proper officer of five dollars per acre, together with the cost of such survey, plat and notice, and giving satisfactory evidence that said diagram and notice have been posted on the claim during said period of ninety days, the Register of the Land Office shall transmit to the General Land Office said plat, survey and description, and a patent shall issue for the same thereupon; but said plat, survey or description shall in no case cover more than one vein or lode, and no patent shall issue for more than one vein or lode, which shall be expressed in the patent issued.

SEC. 4. And be it further enacted, That when such location and entry of a mine shall be upon unsurveyed lands, it shall and may be lawful, after the extension thereto of the public surveys, to adjust the surveys to the limits of the premises according to the location and possession, and plat aforesaid, and the Surveyor General may, in extending the surveys vary the same from a rectangular form to suit the circumstances of the country and the local rules, laws and customs of miners; Provided, That no location hereafter made shall exceed two hundred feet in length along the vein for each locator, with an additional claim for discovery to the discoverer of the lode, with a right to follow such vein to any depth, with all its dips, variations and angles, together with a reasonable quantity of surface for the convenient working of the same as fixed by local rules; And provided further, That no person may make more than one location on the same lode, and not more than three thousand feet shall be taken in any one claim by any association of persons.

SEC. 5. And be it further enacted, That as a further condition of sale, in the absence of any legislation by Congress, the local Legislature of any State or Territory may provide rules for working mines, involving easements, drainage and other necessary means to their complete development, and those conditions shall be fully expressed in the patent.

SEC. 6. And be it further enacted, That whenever any adverse claimants to any mine located and claimed as aforesaid, shall appear before the approval of the survey, as provided in the third section of this act, all proceedings shall be stayed until a final settlement and adjudication in the Courts of competent jurisdiction, of the right of possession to such claim, when a patent may issue, as in other cases.

SEC. 7. And be it further enacted, That the President of the United States be, and he is hereby authorized to establish additional land districts, and to appoint the necessary officers under existing laws, wherever he may deem the same necessary for the public convenience, in executing the provisions of this act.

SEC. 8. And be it further enacted, That the right of way for the construction of highways over public lands, not reserved for public uses, is hereby granted.

SEC. 9. And be it further enacted, That whenever, by priority of possession, rights to the water for mining, agricultural, manufacturing or other purposes, have vested and accrued, and the same are recognized and acknowledged by the local customs, laws and the decisions of Courts, the possessors and owners of such vested rights shall be maintained and protected in the same; and the right of way for the construction of ditches and canals for the purposes aforesaid is hereby acknowledged and confirmed. Provided, That whenever, after the passage of this act, any person or persons shall, in the construction of any ditch or canal, injure or damage the possession of any settler on the public domain, the party committing such injury or damage shall be liable to the party injured for such injury or damage.

SEC. 10. And be it further enacted, That whenever, prior to the passage of this act, upon the lands heretofore designated as mineral lands, which have been excluded from survey and sale, there have been homesteads made by citizens of the United States, or persons who have declared their intention to become citizens, which homesteads have been made, improved and used for agricultural purposes, and upon which there have been no valuable mines of gold, silver, copper or other mineral discovered, and which are properly agricultural lands, the said settlers or owners of such homesteads shall have a right of pre-emption thereto, and shall be entitled to purchase the same at the price of \$25 per acre, and in quantity not to exceed one hundred and sixty acres; or said parties may avail themselves of the provisions of the act of Congress, approved May 20, 1862, entitled "An Act to secure homesteads to actual settlers on the public domain," and acts amendatory thereof.

SEC. 11. And be it further enacted, That upon the survey of lands aforesaid, the Secretary of the Interior may designate and set apart such portions of the said lands as are clearly agricultural lands, which lands shall thereafter be subject to pre-emption and sale as other public lands of the United States, and subject to all the laws and regulations applicable to the same.

Passed July, 1866.

### Our Patent Agency.

The Patent Agency of the Mining and Scientific Press has been signalized with remarkable success during the past two years. The importance to the inventive genius of this coast of a thorough and reliable agency for the solicitation of Letters Patent from the United States and foreign Governments cannot be over-rated, and the Proprietors of the Press, feeling the responsibility which rests upon them, and the reward which must follow the faithful performance of their trusts, will take care to afford inventors every advantage to be secured to them through a competent and responsible agency upon this coast.

## SAN FRANCISCO ASSAYING

### REFINING WORKS,

No. 416 Montgomery Street,  
Successors to KELLOGG, HEUSTON & CO.

CAPITAL STOCK, \$1,000,000.

DIRECTORS: CHAS. E. McLANE,  
JOHN PARROTT, WM. C. RALSTON, A. HAYWARD,  
LOUIS A. OARNETT, LOUIS A. OARNETT.

THIS COMPANY, HAVING GREATLY ENLARGED their Refining Works, and introduced many other important improvements, are pleased to announce that they feel warranted in again reducing materially their terms of doing business.

### The Tariff of Charges

Which they now submit to the public—considered with reference to the cost of material and labor—is lower than in any other part of the world, and secures to the mining interest of this coast an important increase in both the mining and commercial value of bullion. Their charges hereafter will be as follows:

### For Assaying Deposits for Unparted Gold Bars.

One-eighth of one per cent. (heretofore a quarter) for all amounts over \$1,600, and two dollars for any smaller sum. Returns made in twenty-four hours.

### For Assaying Deposits for Unparted Silver Bars.

Two dollars for the gold contained, up to \$1,600, and one-eighth of one per cent. for all amounts over that sum, and one per cent. on the silver contained. Returns made in twenty-four hours.

### For Refining Deposits made for Coin or Fine Bars.

On bullion under 300 parts gold, 2 cents per ounce.  
On bullion from 300 1/2 to 600 parts gold, 4 cents per ounce.  
On bullion from 600 1/2 to 750 parts gold, 6 cents per ounce.  
On bullion from 750 1/2 to 930 parts gold, 8 cents per ounce.  
Above 930, the only charge will be for coinage. But there will be no charge for refining less than two dollars.

### For Coining Gold.

This charge will be the same as at the Mint—a half of one per cent.—and which is paid by us to that Institution. But there will be no charge in future for making fine gold and silver bars from bullion refined by us.

### Returns in Coin made in Forty-eight Hours.

Silver contained in deposits for coin will be accounted for at the same rate customary at the Mint.

Gold bars of other Assayers in good standing, will be cashed by us at the highest market rates.

Dust and bullion can be forwarded to us from any part of the country, and returns made through Wells, Fargo & Co's Express.

### Charges at the U. S. Branch Mint.

For the convenience of those not familiar with the terms of the Mint, we subjoin the tariff of charges now in force at that Institution:

For refining bullion under 300 parts gold, 3 cents per ounce.

For refining bullion from 300 1/2 to 600 parts gold, 5 cents per ounce.

For refining bullion from 600 1/2 to 750 parts gold, 7 cents per ounce.

For refining bullion from 750 1/2 to 930 parts gold, 11 cents per ounce.

For refining bullion from 930 1/2 to 999 1/2 parts gold, 14 cents per ounce.

The charge for coinage is a half of one per cent., and the charge for making fine silver bars, the same.

Comparing the net value of deposits for coinage, with the proceeds of unparted gold bars sold in the market—assuming that the bars have cost 3/4 of one per cent—they must be sold at the following par rates to equal the return which would have been made had they been deposited for coinage.

830 par to equal Mint return, at refining charge of 14 cents.

845 par to equal Mint return, at refining charge of 11 cents.

865 par to equal San Francisco A. & R. Works return, at refining charge of 8 cents. 8v14f

## SAN FRANCISCO

### UNION BUSINESS COLLEGE

Merchants' Insurance Building,

408 California Street.

THIS INSTITUTION IS DESIGNED TO PREPARE boys and men for business pursuits, and to impart a thorough commercial education. It is conducted upon actual business principles. The student, upon entering College, is furnished with a capital in cash and merchandise, rents a place of business, opens an account with the bank, makes and negotiating notes, drafts, bills of exchange, etc., recording the transactions and keeping the books in a regular and scientific manner. From this he advances in other capacities, until he finally takes his position in the Union College Bank, a regularly established institution, complete in all its appointments, and having a circulation of one million in College currency. This course saves from four to six weeks' time in copying useless manuscripts. There is no vacation, and students can enter upon any business during the year. The public are invited to call and examine the various departments. Sessions day and evening. Address 7v11 JAMES VINSONHALER, Principal.

### Endorsement by the Miners' State Convention

The following resolution was adopted by the California Miners' State Convention, held at Sacramento, Jan. 17th, 1866:

Resolved, That we regard a mining paper or journal of great importance to the mining interest of California, and we recommend the MINING AND SCIENTIFIC PRESS, of San Francisco, to the consideration and support of the miners of the Pacific coast.

Mining Inventions, etc. New Books. Mechanics' Institute. Barren Canal killed by Snow.

## A New Mineral—Hubnerite.

In our issue of Sept. 29th, 1866, we acknowledged the reception of a collection of specimens from Mr. A. H. Howk, of Weston, Nyo county, Nevada, among which we noticed one as "evidently a tungstate—probably of iron and manganese." We subsequently submitted the mineral to Prof. Blake, who, upon a preliminary examination, reported the following, in connection with other mineralogical notices, to the California Academy of Natural Sciences:

**Tungstate of Manganese.**—I have received from Mr. Ewer, fragments of a mineral from Nevada, which appears to be tungstate of manganese. It is in radiating prismatic crystals; color dark olive green; high specific gravity, and before the blowpipe gives the reactions of tungstic acid and of manganese.

Silliman's *Journal of Science*, for January, in copying the above, thinks the mineral is the same as that referred to below as a new mineral. Both, it will be seen, are from Central Nevada, and possibly from the same locality. We again copy from the *Journal of Science*:

**Hubnerite, a new mineral.**—E. Riotte has described, in the *Reese River Revue*, a new tungstate of manganese, entirely free from iron, found in the Erie and Enterprise veins in Monmouth district, Nevada. From a notice of Riotte's paper by H. Credner, in *Berg. und Huttenmännisches Zeitung*, we take the following:—Crystallization trimetric,  $I: L=105^\circ$ ; generally in columnar masses or foliated, imbedded in quartz. Cleavage brachydiagonal, very perfect. Fracture, uneven.  $H=4.5$ .  $G=7.9$ . Color brownish red to brownish black. Streak yellowish brown. Luster adamantine on the cleavage plane, and otherwise greasy. Translucent to opaque. Analysis by Riotte and Hubner gave,  $WO_3$  76.4,  $MnO$  23.4. B.B. gives reactions for both tungstic acid and manganese. Partially soluble in chlorhydric acid, leaving a yellow residue almost completely soluble in ammonia. Hubnerite is, according to Dr. Adelberg, found in both of the localities in a vein three to four feet wide in a metamorphic clay-slate, and is associated with scheelite, fluor-spar and apatite. A later article by Breithaupt, in the same journal, questions the correctness of the crystallographic measurements, and gives the density as 7.14.

**Slow.**—A message sent by the Atlantic Cable travels only a little over six thousand miles in a second, while a message sent by a land line, travels sixteen thousand.

## Our Steam Navy.

The *London Engineer*, of a recent date, contains a very pointed, just and well written critique on the lack of efficiency manifested by our Governmental Bureau of Naval Steam Engineering. This department, it will be recollected, is under the direction of Mr. Isherwood, as chief engineer. Almost or quite the entire of the scientific and intelligent commercial press of our own country, which has referred to the subject at all, fully agrees with our English contemporary, that there is a most manifest need of improvement in this direction; and that the danger is imminent that our new navy will be most seriously impaired by the defective nature of the steam machinery with which it is being supplied. In fact, the damage is already upon us; and the wonder is that the government is not aroused to action, in view of the almost united testimony of the scientific and practical engineers of the country, against the principle of construction adopted and persisted in by the chief engineer.

Mr. Isherwood does not believe in working steam expansively: hence his cylinders are small, and his boilers large. As an illustration of the lack of efficiency involved in his theory, the machinery of the unarmored frigate Franklin is particularly alluded to. This is one of the government vessels, built with great strength to carry enormous guns, and which should be prepared to attain a high rate of speed, to protect our commerce from such piratical craft as the *Alabama*, etc. Her boilers and machinery have been designed after Mr. Isherwood's peculiar notions, in accordance with which all he can promise is ten miles an hour! Good engineers say he never will realize even that. Her cylinders are, out of all manner of proportion, too small for her boilers; because the principle he adopts requires such a construction—even though it be at the expense of speed. He is equally at fault with experience, in giving too large bearing surfaces to his journals, by which unnecessary friction is engendered, and consequent binding and cutting of both journals and bearings.

At the trial trip of the Franklin, only twenty revolutions could be got from her engines, in consequence of her journals becoming heated from the above cause, when she ought to have run up to double that number. Of what value would such a vessel be in acting the part of police of the seas, where speed is the chief essential? But still Mr. Isherwood, it is said, clings to his own notions in manifest and utter disregard of the teachings of both science and practice.

It is much to be regretted that our gallant navy, manned by the best crews that ever sailed a ship or stood by a gun; built after the most approved models and furnished with the most efficient weapons of attack and defence, should be rendered altogether inefficient by the headstrong notions of a single individual. All the progressive ideas of the age have been brought to bear in the

construction and armament of our national navy, until both ships and guns have become almost new creations. But the motive power, by which all this enginery of war is propelled, stands where it did twenty years ago; before necessity proved itself such a prolific mother of invention. So long as an enemy can be kept within pounding distance, our gallant heroes care but little for Mr. Isherwood's slow machinery; but when it becomes necessary to chase him through wide ocean wastes, it is bitter and galling in the extreme to see him escape with light heels, in consequence of the antiquated ideas on which our propelling power is modeled. These may be unpleasant facts to acknowledge; but from what we can gather from the controversy on this subject, they appear to be well sustained. It is possible that the engineer may be himself so hampered by the everlasting red tape system, that the fault should rest on other shoulders. It is, however, time the public were informed as to who is responsible for the abuse of ignoring principles which not only bear the test of untrammelled scientific investigation, but which have been moreover daily verified by actual practice, in various parts of the world, for more than a decade.

**MECHANICS' INSTITUTE.**—The annual election of this association will take place at their new rooms, on Post street, above Montgomery, on Monday next, March 4th. The work of moving into these rooms is already commenced. The following are the regular nominations: President, Henry K. Gluyas, Vice President, J. M. Eckfeldt; Treasurer, Thomas Young; Recording Secretary, D. E. Hayes; Corresponding Secretary, Horace D. Dunu; Directors, Joseph McGill, Hiram Rosekrans, George T. Bohlen, James Spiers, C. H. Harrison, Samuel Tyler and W. C. Pease.

At an adjourned meeting of members, held on Thursday evening last, an opposition ticket was presented. It is as follows: For President, D. A. MacDonald; Vice President, A. C. Austin; Treasurer, W. H. Davis; Recording Secretary, J. H. Culver; Corresponding Secretary, W. F. Herrick; Directors, Gardiner Elliot, John C. Sheldon, R. S. Eels, William Corcoran, C. T. Tilden, Samuel Smith, J. B. Johnson. It is expected that there will be a spirited contest.

A resolution was passed at the meeting of February 21st, instructing the Corresponding Secretary and President to communicate with Prof. Agassiz, with a view of inducing him to visit California, and deliver a course of lectures before the Institute.

**THE DARIEN CANAL.**—Senator Conness has secured the passage of a resolution instructing the Secretary of State to obtain from the Colombian Government authority for a survey for a ship canal across the Isthmus of Darien, and to ascertain the terms upon which the right of way can be obtained. It has been estimated that the value of the Darien Ship Canal to California alone would be equal to an addition of \$100,000,000 to her taxable property within ten years.

## Golden City Chemical Works.

We mentioned this new corporation in our last, giving the names of the incorporators, and stating the object of the association. It is one of the most important enterprises of the day. Immense quantities of sulphuric and nitric acids are used on this coast, and will continue to be used so long as our mines yield the precious metals, and the assayers' profession is practised. But as these articles are of a dangerous character, as regards transportation, ship owners are unwilling to take them in charge, except at such high rates of freight and insurance, that they cost here about double their value at the manufactory. If, therefore, any commodity should be manufactured here, these should. The Golden City Works will, for the present, devote attention especially to the making of these acids. Their arrangements for the purpose are the most complete of any on this continent. The cost, up to this time, has been not less than \$250,000, and the incorporators are among the millionaires of the State. All the modern improvements have been adopted without regard to expenso. An English foreman of experience has been imported. H. P. Wakelee is the chemist and superintendent. A large amount of material is already stored in the warehouses of the company. One thousand tons of nitrate of soda, worth, say eighty dollars per ton, and five hundred tons of sulphur, worth sixty-five dollars per ton, are now on hand. Both were imported—the former from Peru, and the latter from Sicily. As regards sulphur, however, there will in future be a supply from our own State, and there is reason to believe that nitrate of soda, also, will ere long be found here in sufficient quantity to make us independent of other markets. The company has already on hand some two hundred tons of acid. Of this, one-half is in carboys, the balance in the chambers, for want of carboys to contain it. Three thousand of these are ordered from the Pacific Glass Works, which will be furnished as soon as they can be turned out.

The capacity of the apparatus is about ten tons per day of sulphuric acid, and one ton and a half of nitric. The company has a contract with the Mint for three years. They can and do furnish acids at the same price as that paid by the Philadelphia Mint to the manufacturers of that city.

The arrangement of the works are such as to admit of enlargement, from time to time, as the demand for any other chemicals increases on this coast. It is the intention to manufacture any and everything in that line that can be required in quantity.

**COUNTERFEIT QUARTERS** are in circulation which, from their general appearance, are calculated to deceive the public. The ring of the pieces is clear and sharp; but they blacken readily on the application of a neutral solution of urate of silver. They contain no silver, being composed of copper, nickel and zinc. So far as observed, they are all dated 1854, and have the letter "S" under the eagle.

## Communications.

IN THIS DEPARTMENT we invite the FREE DISCUSSION of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[Written for the Mining and Scientific Press.]

## What is a Practical Chemist?

BY E. PIQUE.

This question is rather difficult to answer, as a man can be practical in one or several branches of chemistry, and not practical in many others. Some people imagine that a practical chemist is one that knows every thing; but such a person does not exist. Our life is too short, and the capacity of mind too limited, to allow one single man to have practical experience in all the branches of such an extensive field as chemistry; and this truth must be acknowledged by every man who realizes what an immense number of operations are included in this science, and how vastly different one is from the other. So, for instance, one man might be able to extract metals from ores, and the same man could not, perhaps, make a barrel of good beer; or, a man might be a good sugar refiner, and the same man could not dye cotton or silk properly; or a man might be able to analyze any kind of mineral, and determine with accuracy the elements of which it might be composed, and still be unable to tan the hide of an ox or a calf to perfection. And so there are many thousands of different chemical operations requiring quite different practical experience.

But what I designed particularly to allude to, is the view of some people, who imagine a practical chemist to be only a man that has worked with large furnaces, large pans, large vats, etc.; and further, that a man might be able to do something on a small scale, and still be unable to do the very same thing with large quantities. My opinion is, that a man may have worked with ever so large quantities and still be an ignorant fool. I have worked in many chemical branches, with small and with large quantities, and I can positively affirm that anything that will work on a small scale must also work on a large scale. I have tried it with a great many things, and have always found the same action to take place, whether I worked with an ounce or with a ton. Is there any sensible reason for the contrary? If one ounce of copper will dissolve in three ounces of sulphuric acid, why should one ton of copper not dissolve in three tons of the same acid? Or if one ounce of chlorine gas will precipitate about three ounces of silver from its solution, and produce four ounces of chloride of silver, why should one ton of chlorine gas not have the same effect on three tons of silver?

This point being settled beyond a doubt, by plain common sense, as likewise by my own and other people's experience, I must still confess that sometimes a thing that works well on a small scale, does not seem to give a favorable result when operated on in large quantities. The reason of this apparent contradiction lies in the fact that in working on a large scale, we do not use the same kind of tools and vessels as we do in small experiments. On this very important point whole volumes could be written; but for the benefit of beginners, I will state only a few items. In experimenting, for instance, in the humid way, on a small scale, we generally use glass vessels, because glass is transparent, so that we can watch the changes that take place very precisely, while at the same time good glass resists the action of alkaline solutions, and of all the acids—whether concentrated or diluted, whether cold or boiling hot (with the exception of fluorine acid).

Now, in working on a large scale, glass is an article which should be used only when nothing else will answer, for the reason that glass is liable to be cracked or broken, and that glass vessels can only be procured of limited dimensions, not exceeding a few gallons, while durable metal or wooden vessels can be had of any capacity desired. Therefore, in transferring a small experiment to a chemical operation, on a large scale, we

must first consider whether metal or wooden vessels would not do to work in. Among the metals, we are generally limited to the choice of iron, copper, lead and platinum.

1. *Iron vessels* will answer the best of all in dealing with alkaline solutions. Acids of whatever kind, whether weak or strong, cannot be treated in iron vessels, because they corrode the iron. The only exception to this rule is in the case of concentrated sulphuric acid, or a mixture of concentrated nitric and sulphuric acids, of which property advantage is taken in the refining of silver and gold, by boiling the metallic alloy in cast iron vessels with concentrated sulphuric acid, which dissolves the silver and copper of the alloy, leaving the gold behind. The iron vessels do not suffer at all by this operation, and I have found them after many months use just as good as new. Neutral solutions of iron and zinc can likewise be treated in iron vessels, but not so the solutions of nearly all the other metals; since the iron being electro-positive, would precipitate them in a metallic state, and take their place in the solution, destroying the iron vessel.

2. *Copper vessels* do not answer quite so well for alkaline solutions, although they are in some cases used for them. Neutral or slightly acid solutions of copper, and all the more electro-positive metals, can be treated in copper; but certainly not any of the solutions of the more negative metals, as, for instance, gold, silver, etc., for the same reason as above. Among the acids in common use, nitric acid cannot be used in copper vessels, as this will dissolve the copper. Sulphuric and muriatic acid can be used only when diluted, but not when concentrated, for the same reason. Besides this, it has to be observed that copper is a rather delicate metal, and too strong an action of the fire will oxidize and burn it. Therefore, it is better to keep the fire at a reasonable distance, or what is still a great deal better, to introduce steam, if the contents have to be heated, as then we are in no danger of burning the bottoms of our copper vessels. In regard to economy, it must be said that copper vessels are very expensive, while iron vessels are the cheapest that can be had.

3. *Lead vessels* are the very best for working with sulphuric acid, whether diluted or concentrated. They are, therefore, used for concentrating the sulphuric acid, likewise the solutions of sulphate of copper and other sulphates. They are generally made of a single sheet of lead, which is bent into the desired shape, carefully avoiding any injury to the same. Lead vessels ought to rest on iron plates, so as to prevent their giving way, and also to moderate the immediate action of the fire. If the sheets are not very thick, the sides will also require some support. Should the lead vessels be injured, they can only be repaired by soldering the damaged part with lead, which has to be applied by a particular kind of blow-pipe. Most of the other acids cannot be used in lead vessels unless sulphuric acid be at the same time present. For instance, if we manufacture chlorine gas from peroxide of manganese and muriatic acid, the mixture would destroy the lead vessel very soon, and it would be useless to work in it; but it will stand it very well if we use a mixture of peroxide of manganese with common salt and sulphuric acid; because the latter will form an insoluble coat, which will protect the lead from the action of the muriatic acid. An excellent way of using sheet lead for certain purposes is to line wooden boxes with a continuous sheet of lead, and introduce steam into the fluid contained therein, if we intend to heat it either for the purpose of boiling or evaporating.

4. *Platinum* is a noble metal, more so than gold. It resists the action of every acid, weak or strong, cold or hot. It can only be attacked by *aqua regia*, which is a mixture of nitric and muriatic acid. For this reason it offers more advantages than all the other metals. The only drawback is its high price, which is about one-half that of gold; but still platinum vessels of a pretty good size have been used for some particular purposes.

5. *Wooden vessels* offer a great many advantages. They are cheaper than metallic ones, and can be made of any size and shape desired. They are particularly useful in operations where no artificial heat is required. Very often the mixture is heated in metal vessels, and then removed into the wooden ones, where it remains charged with a certain degree of heat for many hours; the more so, the larger the quantities of the compound are; or the mass can be heated in the wooden vessels themselves by the application of steam, which can be done in two different ways. If the object should only be to heat the contents, the steam is introduced immediately into the fluid mass. But then we have to consider that the steam in heat-

ing the water will itself be condensed, and consequently, after some time, the quantity of water in the wooden vessel will be increased for which increase a convenient space must be allowed. After the temperature of the water has been raised to the boiling point of 212° Fah., no more condensation will take place, and the steam will escape from the fluid in the same state as it enters. But should the object of the heating be to evaporate a part of the fluid, the steam must not be introduced directly; but it has to pass through metal pipes, which are in contact with the fluid, so that the steam will be condensed in those pipes, and the water so originated will have an outlet at the other end. In this case only the latent heat of the steam will act without contributing to the mass of the fluid.

Wooden vessels can be used for any fluid that is not too powerful; therefore the solutions of most of the neutral salts, diluted acids of any kind, and likewise weak alkaline solutions, can be used in them; but concentrated strong acids, and also concentrated caustic alkaline solutions, cannot be treated in wood, as they destroy the same.

Still greater difficulties will be encountered by the beginner in transferring small experiments in the dry way to operations on a large scale. For instance, little experiments on smelting are generally made in crucibles of fire-clay or black-lead. Crucibles are certainly very useful for a good many operations, even of a medium magnitude; but when it is the object to smelt many tons of a certain substance, crucibles are liable to the same objections as glass vessels are for fluids—viz., they are easily damaged, and their size is limited—we have to use a furnace. Now, the question will be, what kind of a furnace? A blast furnace is certainly the most powerful and most economical contrivance for several reasons.

The first reason is, that the fuel is in immediate contact with the material that is to be smelted, and can impart to it the heat generated much more completely than in a reverberatory furnace, where the most powerful heat naturally first strikes the arch of the furnace; and from thence, after losing a considerable quantity, is radiated down upon the matter spread on the hearth.

The second reason is, that the blast furnace does not require any hearth, which is the most trying part in building a reverberatory furnace for smelting. Neither do we want any arch, which is another very expensive part of the reverberatory furnace, as it requires the best kind of fire-bricks, and considerable bracing with iron bars, etc., and after all, having to suffer the most intense heat, does not last as long as we could wish. All these troubles and expenses are avoided in the blast furnace. The construction is cheap and simple, and, as I have said, we produce the greatest possible effect with the smallest quantity of fuel.

[To be Continued.]

## Things Worth Knowing.

Who has not observed that snow always melts faster in the traveled track, than at any other point or line in a road or street? What is the cause of its more rapid disappearance there? Trampling and "cutting up" is not sufficient of itself. It is the custom in New York and most other northern cities to pitch all the snow from the sidewalks into the middle of the streets. Streets which are but little traveled, are thus nearly blocked up with the snow, while those which are much traveled do not have enough, even in the coldest weather, and on frozen ground, to make the sleighing good. Why? There are several causes; the "cutting up" doing but little towards causing the disappearance of the snow. One great cause is the friction produced by the runners, wheels and hoofs. Friction always produces heat. Violent agitation in a close vessel will heat water; two pieces of ice rubbed smartly together will produce a sensible amount of heat.

Another great cause is the absorption of heat, by the dark colored droppings, dirt, etc., which accumulates in the traveled track. White snow melts but slowly, because it cannot absorb heat readily. Spread any dark substance upon it, such as coal dust, etc., and the snow disappears rapidly, even when the air is below the freezing point, because the dark-colored matter rapidly absorbs the heat of the sun and radiates it slowly to the snow, thereby melting it.

Prof. Seeley, in the *Scientific American* gives, as another cause, which he considers

a fact, that there is a streak of warm air up and down the middle of the streets of a city. The professor must certainly be mistaken. There must be a streak of cold air through the middle of the street. The streak of warm air would be found along the house fronts, from which warm air would ascend, and to which cold air would flow from the center of the street, leaving other and still colder air to supply its place; thus rendering the center of the street the coldest portion.

## DANGEROUS PAPER.

The Professor in his communication to the *American*, makes the following very correct remarks, which are well worth bearing in mind: "There is a great difference in the combustibility of common paper. Enamelled card paper, on account of its compact body and the presence of mineral matter, white lead or barytes, is quite disinclined to burn; in fact, some kinds are practically fire-proof. White writing and printing paper can seldom be lighted by a spark, and when ignited by a flame, it requires dexterity to keep it burning. On the other hand, there is a common reddish-yellow paper which, in some circumstances, is as dangerous as gunpowder. It takes fire by the smallest spark, and burns like tinder; when once lighted, if left alone, it is sure to be consumed completely. All the yellow and buff paper which I have tested, out of which envelopes are made, partakes more or less of the same character. I have no doubt that such paper has been the occasion of some of the fires in this city which have been otherwise explained, such as the fires in paper warehouses and offices of professional men. A spark of fire, or the stump of a lighted cigar, falling in a waste basket containing yellow envelopes with other kinds of paper, would have a good chance of setting the whole on fire."

## SPONTANEOUS COMBUSTION.

A word on spontaneous combustion may not be out of place here. Never permit cotton rags or waste of any kind, saturated with oil, to lay around: they will often ignite most unexpectedly. Such waste, when closely packed in a large heap, has been known to ignite spontaneously in three hours! The *Scientific American* is informed by a physician in New York that, having been in the habit of saving pieces of thrown-off linen garments, to be used in dressing wounds, bruises and sores, he took a handful of them one day from a drawer where the pieces were kept, and vigorously applying them to his boots, put them back where they belonged. In a few minutes afterward he saw smoke issuing from the drawer, and upon opening it found the rags in a blaze. Had he left his office before discovering the smoke, the building might have been destroyed.

Not long since, a lot of rags used in a hotel for polishing brass and silver were thrown in a heap in one corner of a room, and not long afterward they were discovered to be on fire. Had this occurred in the night, most likely the hotel would have been destroyed. It is well that such facts as these should be generally known, and always kept in remembrance. Such knowledge would doubtless save the occurrence of many "mysterious conflagrations."

**WILD RICE.**—Some 600,000 bushels of wild rice is gathered annually by the Indians of the Northwest. It generally sells for about \$1, in the fall, but often advances to \$4 and upwards in the spring. It is quite similar to the common rice when cooked, but very dark colored. It grows under water only, and on a level muck bottom. The water should be from one to two feet deep. The yield is from twenty to twenty-five bushels to the acre. We are not aware that this rice has ever been cultivated. Why has not the Agricultural Bureau at Washington tried it? It is said they have not done so. This would seem to be just one of the things which that department should look after, and experiment upon.

**AN ARCH OF IRON AND COAL.**—When Queen Victoria made her recent visit to Wolverhampton, England, to dedicate the statue to Prince Albert, her cortege passed under six triumphal arches on their way through the principal street. The chief of these arches was one of iron and coal, being hewn into blocks weighing two tons each. There was also an arch composed of hardware and japanned goods, among which coal scuttles were quite conspicuous.

## Mechanical.

## Improvements in Steam Boilers.

Considerable attention has been directed of late to improvements in the manufacture of steam boilers. In these improvements two objects have been chiefly kept in view. First, to secure the largest amount of heating surface, combined with the greatest facility for the transmission of heat from the furnace to the water in the boiler. This object is sought to be obtained in the method of arrangement of tubes and flues, and in employing the least thickness of metal compatible with safety. A large amount of heat is lost by employing ordinary boiler iron, rather than steel, which latter being stronger, may be used much thinner than the former. Steel and copper would come into general use in preference to iron, were it not for the increased cost of those materials. The hope is entertained that improvements in the manufacture and manipulation of the former may soon render economical its general introduction in the manufacture of boilers.

Steel has already been employed for locomotive boilers with considerable success. Sixteen cast steel locomotive boilers were manufactured during the first six months of 1865, for an Australian railway company. All the tests applied to these boilers have given most satisfactory results, so much so that nine additional boilers were immediately ordered. Six old locomotives on the same road, have also been supplied with new boilers of steel, and orders have been given for the construction of sixteen more.

The second object in view in the way of improvements is additional security from accidents. Corrosion is the prolific source of deterioration and danger in steam boilers; and the greatest amount of such action, generally occurs along the edge of the inside lap of riveted joints. This action is supposed to occur at that locality in consequence of the alternate expansion and contraction of the joints, by which the corrosive scale is almost daily removed, presenting new surfaces of iron to the action of the water until the joints are so much weakened as to give way. The punching required in forming joints, by taking away a large portion of the iron, and seriously disturbing the molecular structure of that which remains, adds still further to the weakness of boilers at their joints. Hence, boilers almost always give way at such connections, and rarely or never in the center of a plate; unless previously weakened by burning. Carelessness in hammering at the rivets, and in chipping the edges of the plate in the progress of construction, by which the *skin* of the iron is always more or less broken at the joints, is also another fruitful source of weakness and danger, inseparably connected with jointed boilers.

In order to remedy these difficulties, extensive experiments are now being made in the construction of boilers with *welded* instead of riveted joints. The Midland Railway Company in England are now building all their boilers on this plan. The plates are rolled with thickened edges, the ordinary thickness of seven-sixteenths of an inch being preserved in the body of the plate and the edges being thickened to five-eighths of an inch; the taper being gradual and extending from the edge back to about four inches. The longitudinal seams of each cylinder of the boiler iron is a lap weld, and the edges of the cylinders are squared up in a lathe, making flush joints, which are covered with welded hoops double riveted. Machinery not essentially different from that in ordinary use is employed to bend the plate, and the welding is accomplished by means of a crane and a curved anvil face, the convexity of which corresponds to the diameter of the barrel. A welding heat is taken on a portion of the seam, the edges of the plates being scarfed down, and the weld is perfected by repeated heatings of successive portions of the joint.

**STEEL HARDENING BY USE.**—It is a fact well known to locomotive engineers, that steel tires, after they have been some time in use, become much harder on their bearing surfaces than when originally turned out. A hard skin is formed on them which it is very difficult to remove by turning. This is more especially the case on those wheels which are more than others subjected to the action of the brake-blocks. When such wheels require re-turning, it is often found necessary to break up this hard skin by means of a hammer having a blunt cutting-face. The cuts or breaks made by the hammer allow the turning tool to get a hold under the skin, and so do its work. Of course the process of turning such wheels is a very slow one. This difficulty has led to the devising of grinding machines, to take the place of the lathe. The grinding stones are run at great speed, while the wheels which are being ground are made to run against the face of the stones in an opposite direction. The stones are so hung as to be readily moved up to, or drawn back, like the tools of a lathe. These tire-grinding machines are now being quite generally adopted throughout all the English railway repair shops, and are said to finish up their work as nicely, and with as much precision as the lathe. This hardening is noticed only on steel tires.

**FRICTION WHEELS** are being introduced into manufacturing operations at the East, instead of gearing. Beveled frictional wheels for changing the line of motion are also used, and cast just like the ordinary beveled gears, only lacking the cogs—they may be called beveled gear blanks. The face of one is turned and polished, while that of the other is covered with oak-tanned sole leather, soaked and pressed to form. In setting up such wheels, the driver should always be the one covered with leather; then, if the driver continued to revolve, while the driven remained stationary, the wear of the leather would be uniform. The uneven wear of the leather by an opposite arrangement, may be readily conceived. Frictional wheels are used almost entirely in the hoisting works at the mines, both on this coast and in England. This substitute for cog wheels is said, by the *Scientific American*, to work in a very satisfactory manner, doing its work noiselessly, with less frictional wear and tear, while it is less liable to get out of order. Friction wheels are deserving of more consideration than has heretofore been awarded to them.

**UTILIZATION OF ZINC WASTE.**—During the operation of smelting zinc, a large portion of the metal escapes in the form of vapor, consisting of finely divided metallic zinc. This vapor is known as "zinc fume." When it is cooled, it is deposited as fine as dust on every projecting part of the smelting works. A European manufacturer has recently proposed to utilize this substance, by grinding it with varnish, and applying it to iron as a preservative against rust. The principle of the operation is the same as that of galvanizing, but the zinc is applied in a different manner.

**QUANTITY OF WATER FOR STEAM.**—Careful observations show that it requires about forty-five gallons of water to drive a locomotive and train one mile, under full headway. One gallon will drive it about 115 feet only. It requires one pint for every turn of the driving-wheel; half a pint of water is ejected with every puff of steam.

THERE are thirty iron manufacturing in Chicago, several of which are almost exclusively engaged in preparing railroad iron, and together do a business amounting to \$2,500,000 per annum.

INVENTORS should ever bear in mind that the time employed in the elucidation of an invention is never wasted. The fruit may be long ripening, but, when ready to pluck, it will not prove defective.

## Scientific Miscellany.

## A Volcano in the Moon?

One of the well known volcanic craters in the moon, is said to have recently presented some unusual phenomena, which can be explained only on the supposition that this extinct crater has once more become active. This crater is the one known by the designation of "Linnie," located on the *Mare Serenitatis*. It was noticed by an astronomer at Athens, a M. Schmidt, during the months of October and November, to be obscured. English photographs taken during the same time show the crater very faintly marked. The same darkness was observed on this spot by the eminent astronomer Schroeter in November, 1788. The *London Spectator* says:

"The impression is that an eruption is going on? but if so, must not the moon have an atmosphere? Could combustion take place without oxygen? Would the smoke—the carbonic acid gas—rise without some heavier gas, like atmospheric air, to rise in?"

It is generally conceded that there is no atmosphere, or at most, but a very attenuated one surrounding the moon. This theory, however, does not militate against the supposition that there may be an amount of oxygen, quite sufficient to support combustion, within the mass of the moon. The now generally received theory is that the moon, in the process of cooling and contraction, has absorbed not only its oceans and all other waters, but its atmosphere as well, or nearly all of the latter. If such be the case, an abundance of oxygen may be found in the crevices and caverns of that orb to support combustion in its volcanoes, even if there should be a deficiency of that element at and near its surface.

**DETERMINING LONGITUDE BY TELEGRAPH.** A particular account of the late interesting operations, of determining the difference of longitude between the Observatory at Greenwich, England, and at the National Observatory at Washington, was to have been read at the late meeting of the National Academy of Sciences, by Dr. B. A. Gould, under whose direction the work was executed. Dr. Gould occupied the Ocean Cable Station at Valentia, Ireland, while the English Astronomer, Royal, gave his co-operation at Greenwich. The results are said to show an unexpectedly close agreement between the now exactly ascertained figures, and the astronomical calculations which had been previously relied on. The free use of both cables was tendered for the purpose. The same class of experiments will soon be made through the Overland telegraph, to fix the exact longitude of San Francisco. The signals transmitted during the operations are said to have possessed more sharpness than had been anticipated, and the time of transmission was remarkably constant.

**BREAD POISONED BY FUEL.**—The discovery has been accidentally made at Cologne, that the bread made in that city often contains lead, zinc, copper and baryta. It was at first supposed that these minerals were mixed with the flour by the flour dealers. An analysis of the flour itself, however, showed that such was not the case. After various efforts to discover the source of the poisonous ingredients, it was finally traced to the *fuel*. The coal and ashes was found in several instances to be highly charged with oxide of lead, zinc, etc., obtained from the combustion of painted boards and other old refuse timber and stuff, such as is often purchased by bakers for fuel, on account of its superior heating qualities. The oxides found in the ashes came from the paints, with which more or less of this wood was covered. These oxides would be deposited on the bottom of the oven.

**LARGE POTATOES MOST NUTRITIOUS.**—Potatoes two inches in diameter contain 17.2 per cent. of nutritive value; those less than one inch but 14.6 per cent. Full growth is requisite for a full development of their nutritive power.

**A NEW AND CHEAP ACTINIO LIGHT.**—It is said that twenty-four parts of nitrate of potash, seven of flour of sulphur, and seven of red sulphuret of arsenic, thoroughly ground together, will make an artificial light of high actinic power, and well calculated for producing photographic pictures. It is, moreover, an economical light, as 400 grammes of the compound, in burning, will make a light lasting one minute, at a cost—New York prices—of three cents. The same intensity of light for magnesium will cost about twenty-five cents.

**PRESERVATION OF MILK.**—It is said that after milk has been boiled under a pressure of about twenty-two pounds to the inch, it may be preserved for an indefinite length of time in air-tight cans. The germs of fermentation cannot be destroyed by ordinary boiling in the open atmosphere; they require the heat due to the above pressure.

**A NEW COMPOUND.**—E. Sichel has formed a new compound, which he calls "elycone-nine." It is made by mixing four parts of yolk of eggs and five parts of pure glycerine in a mortar. The mass has the consistency of honey, and is unctuous like fat bodies. It has remained unaltered by an exposure to the air for three years. Applied to the skin, it forms a varnish impervious to the air.

**LIGHT OF THE SUN.**—The best idea of the intensity of the light of the sun may be inferred from the fact that the most brilliant light which can be artificially produced, when held between the eye and the sun, looks like a dark, black spot—so much more brilliant is the latter.

**A NEW SUBSTANCE.**—At the last meeting of the Academy of Science, in Paris, M. Niklès, professor of chemistry at Nancy, announced that he had succeeded in obtaining perchloride of lead, a curious substance derived from the only compound of lead and chlorine, and which must now be called protochloride. The latter is obtained directly by subjecting lead to the influence of chlorine by the application of heat, or else by treating litharge with hydrochloric acid. It crystallizes in needles, is volatile, and cannot be decomposed by heat. M. Niklès has obtained the new compound by exposing protochloride to the action of a current of chloride in a solution of chloride of lime. The perchloride thus obtained is a yellow liquid, emitting a strong smell of chlorine, and is a powerful agent for communicating that element to other substances. It will dissolve gold, and produces, with aniline and the analogous compounds, those beautiful colors for which those substances are so remarkable. With morphine it yields a color similar to that of the horizon at sunrise; and with brucine a rich cherry red. It will carbonize cane sugar and not glucose, and blacken aniline without producing any effect either on fecula, starch or dextrine.

**A CURIOUS EFFECT.**—Gernez has lately found that many substances which after being fused still retain their liquid form until their temperature has been considerably lowered, are nevertheless solidified while their temperature at the same time rises again to the melting point, either by contact with a particle of the same substance, or of another which has touched it, or by friction of two solid bodies within the fused mass. Phosphorus and sulphur are examples, either of which will instantly commence to crystallize at the point of contact with a particle of their own kind, or with glass which has been touched with the same, or with two bits of glass shaken together, within the melted substance; the crystallization spreading rapidly throughout the mass.

**COFFEE GAS.**—If ground coffee be mixed with cold water, a gas is evoked about equal in volume to the coffee; and if mixed in a closed bottle, filling it, the gas will burst the receptacle. M. Babinet, who observed the fact, does not mention the composition or properties of the gas. Will some of our chemists examine it?

A MASS of iron weighing 1,000 pounds at the equator, would weigh 1,005 pounds at the poles, and but 500 pounds at a distance of 2,000 miles below or 1,650 miles above the earth's surface, and only 160 pounds on the moon. On the planet Jupiter, however, its weight would be increased to 2,600 pounds; while placed on the sun it would gain 27,000 pounds.

**IS SODIUM AMALGAM DANGEROUS?**—We thought this question was settled negatively long ago; but it seems that some of our contemporaries are still very much alarmed about a *spurious* sodium amalgam, which, according to a New York paper, is being extensively sold in this State, and which is described as a "dangerous compound." Our mining friends need entertain no fear whatever from anything of the kind, for there is no possible compound of sodium and quicksilver which can be made explosive, or which may not be taken, in any quantity, in the hand, and held under water with the most perfect safety. The story about a quantity of sodium amalgam being sent to New York for analysis, containing a large quantity of oil, etc., is no doubt correct, for it is kept in oil (coal oil) to preserve it! The oil is no injury to it. We can assure our contemporary, the N. Y. *Mining Journal*, which first started this story, that the sodium amalgam manufacturers in California have not "bungled" at all; the bungling has been done by the writer of the article in question. What he says about the *metal* sodium, however, is correct. It should not be used by persons who are not well acquainted with its nature. What he says about sodium *amalgam* is all wrong, and has no foundation in fact.

**NATIONAL INSURANCE COMPANY.**—This organization held a meeting, on February 25th, to vote upon the question of disincorporating. The decision was against it. Only 3,454 votes were recorded in favor of the proposition, whereas 6,667 were necessary to carry it. Mr. S. P. Dewey, the original mover of the proposition, then offered a resolution that the action be declared unanimous, and that all pledge themselves to use their best endeavors to promote the future interests of the Company. This was carried, and the best feeling prevailed. We are glad that this Company has taken this action. We consider it one of the soundest and most reliable, of this class of institutions, in the State.

**MINING INVENTIONS, ETC.**—It is said that during the year 1865, the number of patents issued for inventions relating to the mining, metallurgical and mineral arts, number two hundred and two. The same class of inventions for 1866, undoubtedly outnumbered those of the previous year. Let us hope that this sign of prosperity and progress, in such an important direction, may still continue to improve. Another hopeful sign of our progress as a nation, in the mechanic arts, is the fact that during the past year \$133,000 were deposited in the Treasury by the Patent Office, after paying all the expenses of the office. This makes the total amount now to the credit of the Patent Office nearly \$300,000.

**FIRE AT THE MINERS' FOUNDRY.**—On Saturday night last, a fire occurred in the pattern shop of the Miners' Foundry, which destroyed most of its contents. The owners, Messrs. Howland, Angell & King, were insured to the amount of \$18,000, and they estimate the damage as fully that amount. Patterns constitute an important part of the material of a foundry, and they can only be replaced at the expense of much time and money. The origin of the fire is unknown, but it is believed to have been the work of an incendiary.

**LEAD IN ILLINOIS.**—It is said that a portion of the southern part of Illinois, near the Ohio river, appears to be filled with lead veins thirty to fifty yards apart, and yielding ore in paying quantities. These veins begin about thirty feet below the surface, and have been traced down to the depth of 1,600 feet, becoming richer the deeper they descend.

**PATENT REPORTS.**—We acknowledge the receipt from T. C. Theaker, U. S. Patent Commissioner, of a copy of the Patent Reports for 1862.

**KILLED BY SNOW.**—We learn with deep regret of the death of Mr. Geo. N. McCain, a most estimable citizen of Potosi, near Howland Flat, Sierra county. Mr. McCain was foreman of the Hawkeye Company, and on the 20th ult., while passing along the sluices in the ravine, he was caught by a slide and buried about six feet deep in the snow. His fellow workmen soon found his lifeless body. Deceased was a native of Pennsylvania. He leaves a wife and one child. Our informant states that a terrible storm was raging at the time of the accident, and people found it difficult to visit their nearest neighbors without the aid of snow shoes.

**STANDARD SOAP.**—One of the indispensable necessities in every house is soap; and it is a matter of no little interest and economy, that a good article should be used. Those who are well posted, assure us that no soap for general household purposes, can excel that furnished by the Standard Soap Company, at 207 Commercial street. They also prepare a washing powder, especially adapted for washing and cleaning linen, etc. One great convenience attending this powder is the fact that it works equally well with hard or soft water. Both the powder and soap may be obtained of the grocers generally.

**HYDRAULIC WHEEL.**—George O'Neal, of Dutch Flat, has filed a caveat for a new water wheel invented by him, called the "Hydraulic Wheel." The Dutch Flat *Enquirer* says it is designed principally for mining purposes, and can be made of any size. The buckets receive a stream of water from a nozzle from one-half an inch to three inches in diameter. The wheel can be placed in either a vertical or horizontal position, and the stream can be directed against either the bottom or the top.

**CALIFORNIA PACIFIC RAILROAD.**—The *Vallejo Recorder* says: The road is all under contract from Vallejo to Sacramento. The iron, engines and cars have all been shipped from New York, and will arrive at Vallejo in June. The first seven miles, forming the junction with the Napa Valley road, will be completed and in operation by the first of August at farthest, and the road will be in working order to Sacramento by November of this year. The distance from Vallejo to Sacramento is sixty miles.

**THE INDUSTRIAL MAGAZINE.**—We have received the February number of this periodical, a new monthly of forty-eight pages, published in this city. It is very neatly got up. It professes to advocate "all measures and movements having in view the general good and substantial advancement of the working people—mechanics, miners, farmers, and working men and women of all occupations."

[Special Notice.]

**PERRY DAVIS' PAIN KILLER.**—We have often spoken of this great medicine in terms of very high praise, and we have as often felt that all we could say in its favor would not do it full justice. It is one of those medicines of which we can speak—and speak decisively—from experience; for we have repeatedly taken it, and invariably with the best results and the greatest satisfaction. We always keep it on hand, ready for any emergency, and we regard it not only as one of the best and most reliable of medicines in use for various ills, but as one of the cheapest, also. Its cost, by the way—that is the cost of all the ingredients of which it is composed—has been considerably increased, but the price of the medicine has been but very little advanced. It is not likely that the popularity of Davis' Pain Killer will in any measure decrease, or that the demand for it will in the slightest degree decline, until some other specific for allaying pain and curing the various complaints for which it is so generally used, shall be discovered, of equal potency with it—of which there seems to be little probability. As a remedy for stomach complaints, such as dysentery, diarrhoea, &c., the Pain Killer is without doubt unsurpassed, and everywhere most deservedly in demand. One, two or three doses, of a teaspoonful each, in a wine glass of milk and water, with a little sugar, have repeatedly, within our knowledge, effectually cured serious trouble of this kind. Judgment should undoubtedly be used in not checking certain stages of diarrhoea too suddenly; but taken at the proper time, the Pain Killer will act like a charm, and frequently cure when nothing else will. *Providence Advertiser.*

## Weekly Stock Circular.

Of Associated Brokers of the S. F. Stock and Exchange Board.  
SAN FRANCISCO, SATURDAY MORNING,  
March 2, 1867.

### MONEY MARKET.

The money market has been quite apathetic since our last reference, owing to the inactivity in business circles and other well known causes. There is no variation in the rates of interest for Bank accommodations, which remain at 1@1½ per cent. per month; but unemployed funds continue to accumulate, and a tendency to greater ease is quite apparent.

The *Mercantile Gazette*, of the 27th ult., has the following in regard to the sale of drafts on the East by the Sub-Treasurer in this city: "No transfer orders of the Register of the Treasury at Washington upon the Assistant Treasurer in New York have been on the market recently, the Sub-Treasury in this city not requiring funds for immediate disbursement. The excess of Federal expenditures over receipts in Greenbacks on this coast the past year amounted to nearly \$4,000,000, and the sale of these drafts or orders has greatly facilitated the payment of this indebtedness. The books of the Sub-Treasurer here contain the names of several hundred parties, who have availed themselves of the privilege of exchanging their Greenbacks for these orders or drafts, and during the past few months \$1,500,000 have been disposed of in this way. We are informed that no telegraphic orders or transfers, payable in the East or elsewhere, have ever been issued from the office of the Sub-Treasurer in San Francisco."

The receipts of Treasure from the interior mining districts have of late been unusually light, and for the entire month of February amounted to less than \$2,500,000. In no previous month within the past year have the receipts been as inconsiderable. Our exports of Treasure for the same period have also been very small, amounting to only \$2,750,000.

Bullion was in active request for shipping purposes, and Gold bars have been sold as high as \$70@80; and Silver ruled at 1@1½ per cent. premium.

### CITY STOCKS.

At a meeting of the stockholders of the National Insurance Company, held on the 25th ult., a proposition to wind up its affairs was lost by a majority of the votes represented. A resolution was then unanimously adopted, pledging the united efforts of the members to secure the success of the company. Some 200 shares of this stock have been sold during the week, within a range of \$73.25@72. San Francisco Gas stock continued to be sold at enhanced rates, advancing to \$70 per share, at which figure considerable transactions have taken place. The consumption of gas in this city is larger, perhaps, than is generally supposed, and during the past year the San Francisco Gas Company supplied their customers with 118,333,365 feet, which at \$6 per 1,000 feet amounts to \$710,000. This company disbursed its usual monthly dividend yesterday.

### MINING SHARE MARKET.

The mining share market for the most part has been tolerably well maintained, and transactions have been quite numerous, notwithstanding the severity of the weather and the paucity of information as to the character of recent developments. We are informed that the condition of the roads leading to the various mills is so bad as to render transportation almost impossible, and that it will be necessary to cease hauling entirely for a few days in order to repair these roads.

**HALE & NORCROSS**—no sales; firmly held at \$3,000 per foot. The annual meeting of stockholders of this company will be held on Wednesday, March 13th.

**SAVAGE**—maintained very uniform rates during the past week, opening at \$1,950, seller 60, then selling at \$1,990@1,960, and closed at \$1,930. We have no advices from this mine at the time of going to press.

**CROWN POINT**—advanced from \$890 to \$925, then gradually receded to \$885@870, and closed at \$830, seller 30. This company, together with all the other claims located in Washoe, has been obliged to rely on telegraphic communication for information in regard to the operations there. Mail dates of the 18th and 19th of February show a yield of 110 and 114 tons of ore respectively on those days, and a telegram of the 25th says that the roads are in a horrible condition, notwithstanding the bullion returns to that date amounted to \$70,500.

**YELLOW JACKET**—has been dealt in to a large extent, over 500 shares having changed hands within the past week, opening at \$680, declining to \$630, rallying to \$710@740, then selling at \$687.50, closing at \$710, b 30. This, of all companies, is the most tardy in giving information to its stockholders in this city, but the inclemency of the weather during the period under review may explain recent delinquency in this respect. It is said that in sinking a vein from the lower level in the North mine, fine ore was discovered. Further than this we have no advices.

**GOULD & CURRY**—met with considerable inquiry, but at declining rates. It sold on Monday at \$510, seller 30, then at \$480, and closed yesterday at \$470, s 5. The latest mail dates, some ten days old, report a vigorous prosecution of prospecting labor. On the fourth station work is being continued to the west, with no improvement of an encouraging nature. The drift from the fifth station west had been carried forward 58 feet.

**CHOLLAR-POTOSI**—has exhibited nearly as much activity this as during the previous week. The closing quotations of last Friday have been well maintained, and sales were made at \$250@256 in the early part of this week, receding to \$238, then rallying to \$248, and closing yesterday at \$239. The same difficulty with regard to full advices prevails with this company as with the others, and the only resort is the telegraph, which says (Feb. 28th) that the developments on the Blue Wing Station of this mine "look well." It is said that the bullion yield during the month of February will be fully as large as that of January.

**OPHIR**—has declined from opening sales of \$220@230 to \$202.50@205, obtaining at the close \$210. Advices by mail of the 18th ult., say that in the ninth station, from the end of the north drift, which is 430 feet from the Mexican company's ground, a drift is being made to the west, which has pierced the rock and now carries quartz and clay. The tenth station drift, east from the shaft, at the above date, was in 54 feet.

**IMPERIAL**—is active, and the recent advance has been well maintained, the slight downward tendency at the close being for the most part attributable to the inauspicious weather; however, it improved from \$185 to \$187.50, then sold at \$170, s 30, and at the close realized \$170, s 30. A telegram of the 25th says that the bullion product to that date for the current month amounted to \$53,000. A dispatch of a later date (the 27th) contradicts the rumor which had gained credence here that a cave had taken place in the Alta mine, and adds that there is no probability of any cave. It is said that there is a large amount of ore developed, and that the mills are running up to their full capacity.

**EMPIRE**—sold to a larger extent than usual, declining from \$190 to \$152.50, and closed yesterday at \$160, seller 3. We learn that the total expenses of this company in February were less than \$14,000, and the amount of bullion produced is \$35,000, which insures the usual monthly dividend.

**BELOCHER**—improved from \$110 to \$115, then sold at \$107, and closed yesterday at \$102.50. **CONFIDENCE** sold at \$17@17.50. **OVERMAN** declined from \$17 to \$13.50, and closed at \$15.50. **BULLION** receded from \$16.50 to \$14 per share, and **DANEY** sold at \$7.

The aggregate sales of Stocks, Legal Tender Notes, etc., since Saturday last, amounted to \$796,998.50.

**LOWER CALIFORNIA COLONIZATION.**—A letter from Mazatlan says that J. Ross Browne is in that city, on his way to confer with President Juarez in regard to the amending of certain stipulations relative to the Lees grant of land in Lower California. He expressed a very poor opinion of the prospects for settlers in that country.

**GETTING UP.**—Portland is said to be getting up out of her ash heap with almost miraculous rapidity.

Our Free List in San Francisco, will hereafter receive the Press through the post office, postage free.

## Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

## CALIFORNIA.

## Amador County.

From the *Ledger* of Feb. 23d: Last Monday they cleaned up, at the Oneida mill, a run of eleven days with forty stamps, and the result was eight thousand dollars, taken from five hundred tons of rock. The mine is now in such condition that plenty of rock can be taken out to keep their mill constantly running.

## Butte County.

From the *Marysville Appeal* of Feb. 20th: At Bangor, a large company from Timbuctoo is engaged in running an incline into a hill near town, through solid rock, for the purpose of striking a gravel bed which is supposed to be deposited in the hill. They use water power on an overshot wheel, for the purpose of raising the rock from the bottom of the incline.

The *Record* says the mining prospects at the lower end of town, and also at the bluff, continue good. Those interested in the developments already made, are of the opinion that they have struck a good thing.

## Calaveras County.

From the *San Andreas Register* of Feb. 23d: At Campo Seco, C. F. Huffman, superintendent of the Lancha Plana Copper Mining company, gives notice that proposals will be received up to the 25th instant, to run fifty feet of tunnel. The Lancha is one of the best claims in the district. It is the intention of the company to put on a large force in the spring, and prosecute the work in earnest.

The *Copperopolis Courier* says the Keystone is sinking on the main shaft with industry. . . . Immense piles of ore have accumulated at the Union works since the freighting ceased. . . . The Empire has been yielding some very rich ore within a few days.

## El Dorado County.

From the *Courier* of February 23d: Another rich discovery was made last week in Kelsey district, by Messrs. Stewart & Ellis. Specimens of the rock brought to town are as rich as any we have yet seen. Several hundred pounds was taken out at a depth of only eight feet. The ledge is well defined, and varies from eighteen inches to two feet in thickness.

Some specimens of rock shown us from Gillenwaters, Christian & Co's claim, on Clay Hill, will average twenty dollars to the pound. The company have a tunnel in a hundred feet, and in about forty feet more they expect to strike the ledge.

Messrs. Dickerhoff, Reed & Co. have taken up what is known as the Miller lode, three miles from this city. Their shaft is down twenty-five feet, and at that depth the ledge is sixteen feet wide. The rock averages from fifty cents to one dollar per pan-full, and growing richer as work progresses.

From the *Democrat* of same date: A Kelsey correspondent informs us that rock recently tested from two lodes in that district, averaged thirty-two dollars to the ton. The region was noted in early times for its rich placer diggings.

A Placerville correspondent of the *Sacramento Union* says, Feb. 22d: In a ledge fifty feet in width, running through the old Buckeye claim, on Texas Hill, every pan from several places on the ledge prospects from five to fifteen cents to each pan. The owners, H. A. and W. Wright & Co., intend to put up an anrastra immediately. A ledge of the same character was found last Saturday by E. Clackley, opposite the residence of T. Fraser, which pays ten cents to the pan. The Long Island claims were purchased a few days since by French & Co., of Gold Hill, at \$2.50 per foot. Hall & Co., on the same ledge, are getting fine rock. They intend to put up an anrastra immediately. Shephard & Co. have got ready to take out rock. One thousand dollars of coarse gold has been picked up from the dirt within the last four weeks. Two new mills to crush cement have recently been put up on Texas Hill, which promise well. The cement mills on Smith's Flat are all paying good wages. At Brownsville, Tullock & Co. have made three runs on rock from the Independence ledge, which paid between \$35 and \$50 per ton. Stillwagon & Co., on the South Fork, have made one run with their new mill which paid \$65 per ton. The old Eagle claims at Grizzly Flat, are paying better than they did ten years ago. A new 40-stamp mill will soon be completed on the old Steele ledge.

On Saturday, Feb. 23d, at Centerville or Pilot Hill, in El Dorado county, about fifteen miles from Folsom, about forty pounds of rich ore was taken out of an old

quartz ledge owned by Martin, Owen, Goodpasture and another individual, most of which ore is pure gold.

## Klamath County.

From the *Yreka Union* of Feb. 16th: Dick Humphrey, expressman and mail carrier down the Klamath river, reports that the miners of the various camps along the route are beginning to take out gold, and that the prospect for a profitable mining season is good.

## Nevada County.

From the *Transcript* of Feb. 20th: The mining on the river bars, near Washington, has been mostly suspended on account of high water, but all the companies will resume operations early in the spring, and more mining will be done than for several years.

Same of 23d: We understand that a new ledge was recently struck by Brown & Co., on the ridge near the Star Spangled Banner mine, and the rock resembles the ore taken from that mine very much. The ledge is large and well defined, and good prospects have been obtained, but it is not yet sufficiently opened to thoroughly test its value.

Palmer's mill, on Friday, started up on a lot of 150 tons of rock from the Wagoner ledge. This lead is owned by Sigourney and others and is located upon Piety Hill. The quartz looks well.

Same of 26th: The Kennebec Company, at Birchville, after a run of twenty-eight days, cleaned up \$7,000. This company is engaged in hydraulic mining.

From the *Gazette* of 20th: In Grass Valley, some \$28,000 was melted in "bricks" yesterday at the Eureka; the Empire mine is yielding gold in fabulous quantities; while the New York Hill, Heuston Hill, and North Star, are doing better than ever before.

We have received a rich specimen from the Banner mine, rich both in free gold and sulphurets. It was taken from the lower south level.

From the *Grass Valley National* of Feb. 21st: Capt. Lee set the additional fifteen stamps of the Ophir Mill to running, on Tuesday last, thus putting thirty stamps in motion. We perceive that, notwithstanding the flood, the whole number of stamps are going to-day.

On the Snow Ball Ledge, machinery will probably be erected in the spring.

From the *Grass Valley Union* of Feb. 23d: In the O'Connor mine, Union Hill, the mill was again started upon Monday last, and on Thursday they struck the ledge. At the depth of one hundred and eighty feet, they have a fourteen-inch vein, which shows largely of free gold.

EXCELSIOR.—The editor of the *Meadow Lake Sun*, who recently visited the Grant mine, at Carlisle, says the mill is running regularly, and crushing eight tons of rock a day, which yields on an average \$50 a ton. Nine men are now employed to mine the rock, deliver at the mill, and reduce it. The mine never presented a more flourishing and prosperous condition than now.

## Placer County.

From the *Stars and Stripes* of Feb. 20th: The Rising Sun Quartz Mining company, in the vicinity of Colfax, who had ten tons of rock crushed about three months ago, which yielded \$53 per ton, have been since that time engaged in sinking a number of shafts. The result being satisfactory, permanent improvements will at once be commenced.

He who, a few months hence, will take position on the narrow ridge between Ophir and Newcastle, not more than half a mile distant from the line of the Pacific Railroad, will be able to take in at a single view no less than fourteen mills engaged in crushing quartz and cement.

From the *Herald* of Feb. 23d: The Golden Rule company were to start their mill at Stewart's Flat again this week. A fine roasting furnace has been erected, and other improvements made since their mill was stopped.

Some rock recently sent from the Canada Hill mine, to be worked at the Golden Rule mill, yielded \$23 in gold to the ton. The ledge averages about four feet in thickness, and the rock crushed was taken indiscriminately from the lode.

## Plumas County.

From the *National* of Feb. 16th: Messrs. Judkins and Kellogg commenced crushing quartz again in their old mill at Round Valley, on Monday last. They have started out to bring in some castings which were stopped by the snow.

Franklin Co., at Saw-pit Flat, who have been running a tunnel for two years, are in high glee at the prospect of striking the channel. Their tunnel is upwards of 2,300 feet in length.

The machinery for Mr. Light's new quartz mill, arrived in Indian Valley last week.

Letter from Greenville to same: Quite an excitement prevails in town in consequence of the discovery of rich gravel diggings in the side hill near North Cañon, on the road leading from Round Valley to Greenville. Parties have been very active during the last few days staking off claims and digging prospect holes.

From the *Union* of same date: Two rich quartz ledges have recently been discovered near the Crescent ledge, in Indian Valley. Five stamps of the Crescent mill run four days on rock taken from one of the ledges, and the owners realized over \$400 from the run.

Blood's quartz mill, near Greenville, for a run of six days, on rock taken from the Indian Valley ledge, paid \$2,600.

Messrs. Killey & O'Neill are at work on a quartz ledge recently struck near Elizabethtown, and are getting some very good prospects. Another company is working upon Nigger Gulch Lead, and are taking out some good paying quartz.

There have been some rich quartz ledges struck near Mill Creek, which prospect well. Mr. Kellogg has a nice silver brick containing \$6 that was worked from the Forty-nine ledge, eighteen miles from Mill Creek.

## Sacramento County.

From the *Folsom Telegraph* of Feb. 23d: Within the county of Sacramento, in that country lying east of the American, and running from Farmer's Diggings thence south to the Cosumnes river and Amador county, embracing the entire to the El Dorado county line, lies a rich mineral district, comparatively unprospected and undeveloped. Besides the placer mines of old, throughout this region runs the great line of quartz ledges, upon which in Amador county are located the rich claims of Hayward and others. In El Dorado, on the same range, near Latrobe, extraordinary rich claims are now being worked. The reason why claims equally rich in Sacramento have not been struck, is that they are off the main routes of travel, in a country desolate in appearance, and very seldom visited. An old miner who has been prospecting in this vicinity for a week or two past, and has located a claim near Buffalo Creek, says there is more good mining ground within a circuit of ten miles of Folsom than in any portion of the mineral region he has visited in this State. In this section a portion of the mineral lands are owned by the Natoma Water and Mining Company, by purchase from the Leidesdorff grant. The company offers every facility to the miner, by leasing to him at nominal rent, and furnishing water, where possible, at low rates.

## San Bernardino County.

From the *Guardian* of Feb. 16th: Mr. Geo. E. Moore, the proprietor of the Green lead, brought to our office during the week a large lump of gold-bearing quartz. The ore was taken from the shaft at a depth of two hundred and seven feet, and fine gold is discernible all through it. The ledge is well defined, with a width of about fourteen inches. This mine is in the vicinity of Holcombe Valley, thirty-eight miles east of this place.

## Shasta County.

From the *Courier* of Feb. 23d: L. Crane, some time ago, commenced prospecting on a large bar above Portuguese Flat, on the Sacramento river, and has lately struck a hack channel which prospects very rich. The bar contains several acres of mining ground, but the supply of water is limited.

A specimen worth \$31 was picked up in the Brumfield claim, on Flat Creek, last week. It was of an oblong shape, entirely free from quartz, and looked bright as a new coin. Several similar specimens have been found in the same claim this winter.

There are but eight men remaining in Copper City. Unless the Kellinger company resume work in the spring, the place will be left without a solitary inhabitant.

## Siskiyou County.

From the *Yreka Union* of Feb. 16th: The following items are from Mugginsville: D. S. Hollenback & Co. commenced washing in their hydraulic claims on Monday last. The prospects for a large yield are fine. . . . Shelley & Co. are preparing to commence work. . . . Luke Shaw is engaged in cutting a ditch to carry water to the new diggings below Mugginsville. The prospects are that this will prove one of the richest mining districts in Northern California.

From the *Journal* of Feb. 16th: New quartz ledges have been discovered on Humbug, which, judging from the specimens, indicate rich deposits of gold.

Owing to the high water and cold weather, business in mining is quite dull in Scott River, the former filling up claims, and the latter rendering their cleaning up rather uncomfortable work. As soon as the weather

gets warm and the spring opens, the prospects are favorable for busy times.

## Tulare County.

From the *Delta* of Feb. 13th: We learn that three of our business men have just completed the purchase of a very valuable mine in the Long Tom district, upon which they will immediately erect a mill.

## Yuba County.

From the *Marysville Appeal* of Feb. 27th: The shafts of the Pennsylvania and Jefferson Companies have been filled by the rains, partially suspending work. We learn that the Jefferson has now been pumped out, and the Pennsylvania was expected to finish last evening. The latter has managed to raise quartz enough to supply one-half the battery.

The Bateman Company, whose ledge is two and one-half miles west of Indiana Ranch, have lately cleaned up the result of forty-three tons of rock, which, without including the amount in the Chile mill, yielded \$1,100, paying at the rate of \$30 to the ton. The ledge is from a foot to three feet in width, and the gold sells for over \$18 per ounce.

Brown's Valley letter to the *North Californian* of Feb. 25th: The Dannebroge, Sweet Vengeance and Rattle Snake (Old Yuba) will resume operations in a few days; we are told on the first of the incoming month. We are confident that before another winter Brown's Valley will stand at the head of important mining towns in the State.

## COLORADO.

From the *Denver News* of Feb. 6th: Ore from the Hattie Jane lode, in Granite district, Lake county, recently assayed \$1,307.72 in gold per ton.

A specimen from the Vermont lode, Georgetown, assayed \$1,958.60 per ton. At fourteen feet in depth the pay streak is from two to six inches in width.

Letter to same from Boulder: Valuable discoveries are made daily. Three ounces of quartz taken from the Aetna tunnel shaft, at a depth of ten feet, gave seventy-three cents in free gold. This ore also contains a large percentage of silver. The width of the vein is not yet ascertained, but it certainly is among the biggest things in the district. There are also two other tunnel companies at work here.

About forty shafts are being worked, thirty of them showing now sulphurets of copper and iron of the richest quality. There are also rich silver veins here. A furnace is now in the course of construction.

From the *Register*: Seven assays of ore from the Bethany lode gave an average of \$10,912 per ton.

## IDAHO.

A letter from Lemhi, Salmon River mines, to the *Boise City Statesman*, dated January 2d, has the following: "I think that this will be the best and largest camp ever struck in the country, outside of Boise Basin. There have been no very large strikes made yet, but the country, as far as prospected, will pay well. We have eight large districts. These diggings were struck late in the fall. The gold is coarse, and assays \$19.70 per ounce. The largest piece was picked up in Bear Track district, weighing \$15.75. These diggings are from seven to ten feet deep, with three feet of gravel. Prospects are from five cents to three hits to the pan. This district is called Nappies, and is the first discovery, and here the most work has been done. From five to sixty dollars to the hand has been made."

## MONTANA.

From the *Post* of Feb. 2d: The Christ-nought mill on the Oro Cache was started on last Monday, and its work was beyond the expectations of the most sanguine. The pans and rollers work admirably. The mill is known as the Chilean, the same as that used in the U. S. Mint at Philadelphia.

The last clean-up from the two mills crushing from the Whitlatch Union lead is by far the biggest thing in that line yet, \$10,500 being the amount taken from the plates and batteries of Hendrie's 18-stamp, and Turnley's 10-stamp mill, in one week's run. Of this Turnley's mill cleaned up \$6,000, and the balance came from Hendrie's. The former ran only five days and a half, and the latter the full six days.

Mr. Hendry's mill, on Grizzly Gulch, in Edgerton county, running eighteen stamps, cleaned up, for the six days ending January 22d, from one hundred and forty-six tons of second-class Whitlatch Union ore, \$4,826. This mill is run at an expense of less than five hundred dollars per week, and made on this run a clear saving of three hundred and twenty dollars per diem.

Nearly ten millions of dollars in gold dust have been shipped from this city and the surrounding districts during the past year.

## NEVADA.

Washoe.

[In the Stock Circular, in another portion of this paper, will be found late mining news from this district.]

From the *Treasure* of Feb 14th: For two years past the mining interest at Peavine has been comparatively dormant; but during the last few weeks several sales of mines have been made, and machinery to work the Bevechimer, Empire and other claims is now en route thither. This morning we were shown some copper ore from the mine that will assay ninety per cent. of the pure metal; and the vein is large, clearly developed and apparently inexhaustible.

From the Gold Hill *News*: Mr. Fleming, formerly of Gold Hill, the "Old Prospector," has finally struck a big thing in Wilson district, on the Walker river. The ledge is very large and of surpassing richness. The quartz is gold-bearing, and will, from present indications, prove a fortune to the old gentleman. The reports from this district are very encouraging.

## OREGON.

A letter to the *Bulletin* has the following: With that singular tendency to failure which characterizes the enterprises of Oregonians, the gold mines of the Cascade mountains are lying unworked, notwithstanding they opened richer and under more favorable auspices than any similar mines that I remember. Nobody seems to know what the trouble is. The Santiam mill is idle—the whole excitement blown over, and work entirely stopped. Yet gold there must be in those mountains, since scarcely a trout stream in the State but mingles gold with its sands in perceptible quantities, if not in paying ones. Silver probably exists along with the gold, but has not yet been reached in working leads. Float ore, of almost pure copper is often found in the coast range, though the veins have never been discovered. It is the same with lead and other ores. These sources of wealth must lie for a much longer time undeveloped, since both capital and labor are required to make them available, while the people of Oregon are not rich, and have a wholesome horror of hard work.

From the *Alta* of Feb. 27th: J. B. Edgington has brought to our office some rich specimens of auriferous quartz, taken from the I. X. L. mine, at Cañon City, Grant county, Oregon. The lode is represented to be twenty-five feet wide, and full of such specimens.

It is said that the coal on Yaquina Bay is to be opened at once, with a view to thorough development. The croppings were found near Oysterville.

ANOTHER HUMBLED EXPOSED.—J. P. Bryant, the whilom "Doctor," who cured by the "laying on of hands," and who came before the San Francisco public just long enough after the celestial "Li-Po-Tai" subsided, to take his turn as a prodigy, has come to grief. He is sued for thirty thousand dollars damages for causing total blindness in a man whose eyes he positively agreed to "cure" in twenty days' time. As a part of the treatment, he induced his patient to have four sound teeth extracted; thus leaving the poor fellow, finally, "sans eyes, sans teeth, sans everything."

It will be remembered that quite a number of our citizens, who have been generally considered people of sense, endorsed this individual as "really having performed some extraordinary cures." When will people learn to take it for granted, that those physicians who have gone through the regular steps of a medical course, aided by the written experience of so many great names, and the personal teachings of living men who are acknowledged to be at the head of their profession, are more likely to treat disease understandingly, than those who affect the mysterious and the supernatural—who talk confidently, and promise positively? Such men are entirely lacking in that modesty which always characterizes those who are truly scientific students of that art which they feel can never be perfected; and it is astonishing that people of sense cannot learn to distinguish the quack by this sign.

VARIETY IN CORN.—No less than one hundred and fifteen varieties of corn are to be sent to the Paris Exhibition by W. S. Carpenter, of New York. This is probably the finest collection of the kind ever made.

## Argentiferous Lead Smelting in Humboldt County, Nevada.

NUMBER TWO.

## THE SMELTING FURNACES

Are a modification of the English Castilian Furnaces, lined up with fire brick at first; but more recently with a variety of sandstone found in the vicinity, which proves superior to the best English brick. The hearth or bottom is a sort of crucible, into which the metal sinks on separating from the slag, and thence is tapped off and ladled into suitable molds for subsequent handling. The ore, as it comes from the mine, is placed upon a platform level with the feeding doors of the furnace. It being a carbonate, and free from sulphur, no previous roasting is required. As it is very friable, at least all that is taken to the furnace, it requires no stamping—the larger lumps are readily broken to the requisite degree of fineness by a hammer.

In preparing a charge, several tons of ore are spread upon the platform, over which a layer of ore, with about 25 per cent. of flux is spread—this amount varying somewhat, according to the character of the ore. The mass is then mixed in charges of about 100 pounds each, and shoveled into the furnace alternately with the charcoal at the rate of about twenty-five baskets of the latter to the ton of ore. The flux employed is composed as follows:

Slags, previously used.....	25 per cent.
Lime.....	2 to 5 "
Litharge.....	5 to 10 "

The slags, as they come from the furnace, are carefully picked over, and all that contain from 3½ to 5 per cent. are thrown aside for subsequent treatment, and are employed, as above, for flux. The litharge employed is also produced in subsequent operations, as will hereafter be seen; so that all the flux which it is necessary to procure outside of the works themselves, is the small quantity of lime, and that is obtained within a few miles of the works.

The size of the interior of the furnace, below the feed opening, is thirty inches square, by twelve to fifteen feet deep. The feeding is continuous, and the furnace is kept in operation until the gradual wear of the linings render extraordinary repairs necessary. From past experiments, it is expected that with the present refractory sandstone for linings, three to six months run will be made without stopping.

The main body of the furnace is constructed upon arches, so as to admit of making temporary repairs while the furnace is in operation. From five to six hundred pounds of ore, aside from the flux and coal, is placed in the furnace every hour; about eight tons each twenty-four hours. The precise amount is governed by the rapidity with which the mass settles. The product of this furnace is of course an alloy of all the metals which the ore contains. At this mine this alloy consists of lead, silver, antimony and iron, in the proportions already given. The next process is for the purpose of getting rid of the antimony and iron; which is accomplished on the principle that those metals will oxidize more freely than the lead or silver. This operation is accomplished in

## THE CALCINING FURNACE,

Which is constructed on a modified principle of the ordinary reverberatory. The sole or hearth of the furnace consists of a cast iron pan about 13 feet long by 5½ broad, and 10 inches deep. The roof of the furnace, which is about ten inches high at the fire bridge, descends gradually until it is only six inches high at the opposite extremity or throat. Six air openings, three on either side, are made through the walls of the furnace, above the hearth, like the working holes of the reverberatory, but smaller. They are used to secure a free access of air to the surface of the melted mass in the pan, by which the oxidation is the more readily produced.

From twelve to fifteen tons of the mixed metals which have been obtained from the smelting operation, are placed in the iron pan which constitutes the sole of the calcining furnace. This metal is melted and gradually raised to a red heat, at which it is kept for some considerable time, subjected to the oxidizing influences of the atmosphere, which enters through the side opening already spoken of. The antimony and iron (and copper, if present) now gradually rise to the surface, become oxidized and is skimmed off, or passes off in vapor, as the case may be. The chief portion of the antimony in these works passes off into the flue, where a portion of it condenses and falls into a receptacle arranged to receive it, in the form of oxide of antimony. Antimony thus becomes no inconsiderable part of the product of this mine. The fire place has a length equal to the breadth of the pan, and is placed precisely as in the ordinary reverberatory furnace. The metal is introduced into the pan in pigs as it comes from the smelting furnace. The first charge, as we have already said, is about twelve or fifteen tons; as soon as this mass is materially reduced by the oxidation and sublimation or skimming off of the antimony and iron, a fresh quantity of crude metal from the smelting furnaces is added. These additions are continued until from twenty to twenty-five tons have been introduced, when the pan becomes filled with a pure alloy of lead and silver, or "rich lead" as it is now called. This is accomplished in about ten days; when the furnace is closed and the metal tapped off, and a new charge is introduced, and the same process as above repeated. The process of refining is daily tested, by assay, as the work proceeds. The "rich lead" is now ready for the final operation of purification, or separating the lead from the silver. This is usually done in one or two ways—the first by what is known as Pattinson's process, the other by cupellation. The former is generally used as an assistant to the latter, and not as a complete operation, and will be described at a future time; the latter is the method adopted at these works. The furnace employed is of a somewhat peculiar description, and is termed

## THE REFINING OR CUPEL FURNACE.

Cupellation, accomplished in one manner or another, has been known from the most ancient times. This process is evidently referred to in the following passage from Ezekiel xxii, 18-20:

"Son of man, the house of Israel is to me become dross; all they are brass, and tin and iron, and lead in the midst of the furnace; they are even the dross of silver."

As they gather silver and brass, and iron and lead and tin into the midst of the furnace to blow fire upon it, to melt it; so will I gather you in mine anger and in my fury, and will leave you there and melt you."

Any one who has seen the glowing action of the calcining and refining or cupeling furnace, with wave surging after wave across the surface of the molten metal, carrying off the dross of antimony, iron, copper, tin and finally the lead, leaving upon the hearth nothing but the pure silver, cannot fail to appreciate the terrible force of the figure employed by the prophet; and no one, under such circumstances, can fail to infer, most unmistakably, that nothing but the process of refining and cupeling, substantially as practiced at the present day, is there described. The same process has been employed by the Romans, and all modern nations, down to the present century. The only improvement yet discovered is that of Pattinson's, already referred to; and even that is employed only under certain conditions. Cupellation is the process employed at the works under consideration; which process we will now attempt to describe.

Four general forms of furnaces are employed in this operation, with slight modifications, by different metallurgists. That employed in this locality is known as the English, in contradistinction from the German furnace. This is also of the class of reverberatories, with high roof and fire-place, as usual, but chimney of small elevation. It is usually made double, with a hearth upon

each side of the chimney. This furnace has a movable hearth, sometimes fixed on wheels, to be moved out on a railway, and sometimes to slide out. In operating this hearth, it is necessary that its elevation should be adjusted from time to time, so as to admit of the proper action of the oxidizing flame upon the surface of the molten metal. This has usually been done with wedges. Mr. Nason accomplishes this object by the use of set screws, working underneath the hearth, precisely as such screws are used over the top of amalgamating pans for regulating the elevation and depression of the mullers. The hearth of this furnace is oval in shape, and consists of a shallow platter-like depression. It is made by first constructing an oval iron frame work, usually about five feet long by forty inches broad, and five to six inches deep. This frame work, which is technically called a test-ring, is closely packed with a mixture of bone ash and willow ashes. The hearth thus prepared is scooped out with a gentle inclination to the center, at which point the material is left about one inch deep. The center of this excavation is somewhat flattened, so as to give more capacity to the same. This is properly called a "cupel."

When thus prepared, and after being dried for several days, it is placed in position, and the fire started gradually, so as not to warm up the cupel too rapidly, else it might crack. When the temperature has reached such a height as to give the cupel a dark red appearance, the lead, which has passed through the calcining furnace, and been there deprived of all the metals except its silver, is now carefully placed in the cupel, in the shape of pigs. As soon as the oxidation begins to take place, a light blast is turned on from the rear of the furnace, so as to drive the litharge, in a constant stream, out at the gate-way of the cupel in a liquid state, into iron vessels. As the litharge flows off, more lead is added until the hearth becomes filled with the silver, when the furnace is allowed to cool, and the coke taken out and sent to the assaying office, where it is melted, assayed and stored for the market.

THE AMERICAN NATURALIST is to be the title of a popular magazine of natural history, which is soon to appear, under the direction of the officers of the Essex Institute, of Salem, Massachusetts. It will appear monthly, and will supply a long existing demand for a popular illustrated publication in that department of science. The magazine will give illustrated reports of scientific excursions, undertaken in behalf of the science of natural history, full explanations of the principles of the structure, development and classification of animals and plants, both living and fossil, together with new discoveries in geology and archaeology. Directions will also be given for collecting, arranging, preparing and mounting specimens, etc., etc. Each number will contain forty-eight octavo pages of reading matter and illustrations, or nearly six hundred pages a year, for the low subscription price of \$3 per annum. A. S. Packard, Jr. in connection with E. S. Morse, A. Hyatt and F. W. Putnam, will act as editors. The list of contributors, as published, numbers fifty-three names, among which we notice most of the eminent naturalists and scientific men of the country. Such a magazine will form a most important addition to the scientific publications of the country, and from its low price, and able corps of editors and contributors, can scarcely fail of meeting with a liberal patronage.

PETROLEUM.—The exports of petroleum from the United States for 1866, were sixty-three million gallons. Prices, at latest dates, were about twelve and one-half cents per gallon for crude, in tanks, and thirty cents for refined in barrels, in bond. The value of the exports is not far from twenty million dollars, or nearly enough to pay the interest on our bonds held in Europe. There was a large stock on hand at the close of the year's business. Prices were reduced on account of the necessity of competing with the coal distillers of England. The natural oil is preferred to the artificially produced article, when it can be had at the same price. The flowing wells of the United States are proving unpleasant competitors to the English coal stills.

## Canvassing Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting our Agents in their labors of canvassing, by lending their influence and encouraging favors. We shall send none but worthy men.

Mr. A. C. Knox, is our city soliciting and collecting Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office.  
San Francisco, Jan 11th, 1866.

Mr. Thomas Starr is Agent for the MINING AND SCIENTIFIC PRESS in Nevada, and will canvass the principal cities, towns and districts of that State. August 25, 1866.  
Mr. L. W. Felton, is an authorized agent for this paper at Portland, Oregon. Dec. 1, 1866.

Mr. S. D. Whitaker, is our authorized Traveling Agent and solicitor from this date. Jan. 1, 1867.  
Mr. E. L. Smith, is a duly authorized Agent for this paper. February 25, 1867.

## San Francisco:

Saturday Morning, March 2, 1867.

## Notices to Correspondents.

J. P. H.—Sacramento. Beach sand is worked, for gold, at a point about two and a half miles south of Crescent City, Del Norte county. A full description of the manner of working this sand was given in our issue of August 11th, 1866. One of the claims is said to pay about eight dollars per day to the man. One of the parties owning this claim, assures us that he made as high as \$75 per day, in 1854, working the sands of Gold Beach, near the mouth of Rogue River. He thinks there may be other rich spots along the coast in that portion of the State. Considerable gold is found in the sand, on the river shore at Martinez, opposite Benicia.

CALIFORNIA is informed that the experiments of Mr. Joule, alluded to in a former number of this journal, appeared originally in the Phil. Tran. for 1850. They showed that the actual quantity of heat developed by friction is dependent simply upon the amount of force expended, without regard to the nature of the substances rubbed together. He found, as a mean of forty closely concordant experiments, that when water was agitated by means of a horizontal brass paddle-wheel, made to revolve by the descent of a known weight, the temperature of one pound of water was raised 1° F. by the expenditure of an amount of force sufficient to raise seven hundred and seventy-two pounds to the height of one foot. When cast-iron was rubbed against iron, the force required to raise one pound of water 1° F. was found, as a mean of twenty experiments, to be about seven hundred and seventy-five pounds, and by the agitation of mercury, by means of an iron paddle-wheel, it was found to amount to seven hundred and seventy-four pounds.

CRIBBO is right; the ostrich feathers alluded to in our notice to correspondents on the 19th ult., as being directed to be impressed on both sides of money permitted to be coined at Aberystwith, South Wales, is the heraldic bearing of the Prince of Wales since the battle of Cressy, on which day it was adopted as part of the *Spolia Optima* by the then prince of Wales, better known historically by the name of the Black Prince, a cognomen applied in consequence of that memorable warrior and statesman. The King of Bohemia was one of the most steadfast and courageous allies of the Crown of France. At the battle named he was slain, his body being found amidst one of the thickest heaps of slaughtered foes. His cap bore the hereditary insignia of three ostrich feathers, fixed in a gold wreath, having inscribed thereon the words *Ich Dien*—I serve. Tradition also relates that the celebrated large ruby, which, however, is by some asserted to be a spinelle, which forms a conspicuous feature in the British Crown, also ornamented the cap of the Bohemian monarch. Be that as it may, since that date the Prince of Wales' "Shield of Arms" has remained as above described.

CHEMISTS.—The solubility of substances by water is generally increased in proportion as the temperature is elevated, but this is not uniformly the case. Lime, and several of its salts, offer remarkable exceptions. Water, just above the freezing point, dissolves nearly twice as much lime as it does when boiling, which is the cause why water, saturated with lime in very cold weather, becomes milky when heated and recovers its transparency on cooling.

## Blasting by Electricity.

NUMBER TWO.

[Continued from Page 104.]

As some of our readers may be desirous of making the experiment of blasting by electricity, we will briefly describe how the thing may be done. Nearly every one is conversant with the manner of sending "a current of electricity," as it is called, though improperly so, from one pole through a length of wire, to the other pole of a battery—in other words, producing an electric circuit. This circuit may be a few inches only, or it may be extended for hundreds of miles, provided the wire is properly insulated.

If, in the course of the circuit, the wires should be passed through a cask of gunpowder, ever so sensitive to ignition, there would be little danger of explosion, except with a battery strong enough to nearly destroy the wires.

In order to fire the powder, there must be some slight interruption to the current. If the wires were to be cut where they passed through the powder, and the ends separated the eighth of an inch or so apart, the powder would be fired. When the current passes along a continuous wire, no spark is perceptible; but if the wire should be cut or separated a little, as above described, a spark would be seen to bridge the space between the two ends. It would be this spark which would fire the powder.

Again, if a short piece of platinum wire, say half an inch or an inch long, be joined by its opposite extremities to the two ends of the severed iron wire, so that the current, in making the circuit, would have to pass through the wire so inserted, the insulated platinum wire would instantly glow with heat. A very slight current would heat it red hot—a heavier one would melt it. Steel wire, connecting the two ends of iron wire, will also heat, but not so rapidly or intensely as platinum.

The heating of the platinum or steel wire, is due to the fact that those metals are bad conductors. The current is apparently retarded in its passage. Excessive friction is produced by the particles of platinum or steel, by which a small wire of either of these metals is heated red hot or even melted; thus firing the powder. So when the current is made to cross a small open space, between the separated ends of the wire, friction is engendered in the atmosphere, so as to produce heat and a bright flame, which would also fire the powder, were it in contact therewith.

Were a large wire to be extended from a positive to a negative cloud in the atmosphere, there would be no visible discharge of electricity (no lightning), and of course no thunder. The phenomena of lightning are produced by the friction and consequent heat generated by the rapid passage of electricity from one cloud to the other, in the absence of any good conducting medium for its quiet passage.

The reader will readily perceive, from the above, how powder is fired by electricity, and how electricity may be sent by a continuous wire, of good conducting power, directly through a keg of powder without igniting it.

The device of placing the two ends of the wire near together, but not so as to touch each other, would be found very difficult in practice; hence, the two ends are joined by the short piece of platinum wire, which accomplishes the same purpose. The only difficulty in the way is to devise a means of doing this readily, and keep the wires from coming in contact above the point where it is connected by the platinum wire. We subjoin two diagrams—one, where the wires are properly arranged, and another, where they are brought in contact:

Fig. 1 represents a hole, with the conducting wires properly inserted, and their

extremities joined together with a short piece of fine platinum wire. Fig. 2 has the main wires pressed into contact with each other, as they sometimes are by inserting the charge. In the first the electric current will pass through the platinum wire, which it will heat to redness, and thus fire the charge; in the second, the current will pass from one main wire direct to the other, at their point of contact, and not reach the platinum wire at all, because the conducting power is greater at the point of crossing than at the platinum junction. The consequence will be that the electric current will pass through the powder, at the point where the main wires meet, without igniting it, and a blast so arranged will fail. The transit of the current would be the same were the main conducting wires to meet at any other point. Sometimes, when a very powerful battery is used, the current will divide at the point where the two main wires meet—one portion of the current returning direct, while the other passes through the platinum wire. If the latter is sufficiently powerful, the charge will be exploded.

Various devices have been contrived to prevent the wires from coming in contact during the filling and tamping of the hole, and also to secure ignition with a comparatively weak current. One very effective way may be described as follows: Take a fine cork, such as is ordinarily used for a quart bottle, cut off a section from a quarter to a half an inch thick; then take two pieces of wire, each of suitable length to reach two or three inches above the hole made for the charge, and pass them both through the cork, about half an inch apart; this being done, connect the ends which have thus been passed through the cork with a short piece of platinum wire, as shown in the diagram. Now, in order to keep the two wires apart, as they pass upward out of the hole made for the blast, a small flat piece of pine wood may be placed endways, resting upon the cork, between the two wires, and extending as high as the powder reaches. In order to keep the wood in place, it may be necessary to wind a string around both wires and wood. From that point, by careful manipulation, one wire may be kept upon one side of the hole, and the other upon the opposite side, the tamping being done between them. This will answer where there is no considerable amount of mineral in the tamping used, or where the rock which is being blasted is not such as would serve to conduct the current away from the wire.

The above directions having been observed, the main wires should now be connected with the two ends of wire projecting from the hole. One of these wires should be conducted along to, and connected with one pole of the battery, and the other with the opposite pole—care being taken, all the while, to keep the two wires apart. In a tunnel, one wire should be conducted along on one side of the tunnel, and the other upon the opposite side, to the battery, which should always be placed at a convenient and safe distance from the locality of the blast. It is better always that the main wire should be of "insulated wire," which can be obtained at the rate of about five cents per foot or less. When naked wire is used, great care must be taken to keep it off from the wet ground, and away from all conducting substances of any kind. Insulated wire can be placed anywhere—on the ground, above it, or even under water—until it reaches the point of contact with the wire at the blast.

The difficulty of making a charge in the manner described, and arranging the platinum connection at every discharge, may be greatly simplified, by constructing beforehand a number of "fuses" or "charges" with platinum connections, as above described, in connection with a small quantity of powder of a better quality than that used for the bulk of the charge, so that the smallest spark may be sufficient to fire the same. With "fuses" so made, all the workman has to do after the hole is drilled, is to pour about half the bulk of his powder into the same; then put in the prepared fuse, pour in the balance of his charge, and proceed at once to tamp, taking care simply that the wires projecting from the fuse do not come in contact with each other. As soon as the charge is made, the wires of the fuse may be readily connected with the main wires, and they in turn with the battery, as will hereafter be shown. Such fuses may be made at a trifling cost—a few cents each. Fuses for this purpose are made and sold in England for less than one dollar per hundred. They could probably be imported and sold here for \$1.50 per hundred.

Different kinds of batteries are used—electro-magnetic, frictional, and various kinds of voltaic batteries. Probably the best, under all circumstances, is that known as "Grove's battery," which can be obtained for from three to four dollars per each cell, according to size. Three dollar cells are perhaps the most convenient for handling. For ordinary surface or tunnel blasting, from six to twelve cells are sufficient. For submarine, from twelve to eighteen may be advantageously employed. A simple framework and box for this battery can be made by any carpenter in a few hours. The manner of working and taking care of this battery can be learned thoroughly in a day. The cost of 400 feet of insulated wire—a great plenty for ordinary use—would be about \$10. Common galvanized iron or copper wire, not insulated, may be used, when proper care is taken to insulate, as in extending telegraph wires, and of course at a comparatively trifling cost. For six or eight blasts per day the cost of acids need not exceed three or four dollars per month. A battery will last for six months without any replenishment other than the addition of the acids employed. At the expiration of about six months, the zincs will require renewal at a cost of about seventy-five cents per cell. The balance of the battery will last, with ordinary care, for an indefinite length of time.

No person that is not well acquainted with the use of a galvanic battery ought to think of using one without some oral instruction, accompanied with practical demonstrations of the mode of its operation. Such instruction can be imparted in a day, so that any person of ordinary intelligence would have no difficulty with its use thereafter. The advantages of electric over ordinary blasting have already been placed before our readers. Much more might be added if we had space. We shall be happy to furnish any additional information to such of our readers or correspondents as may desire it.

LLOYD & STEWART'S NEW ANCHOR.—In this anchor, the two oval flukes and the bow connecting them are in one solid piece. The bow passes through the shank, and has a play of from forty to sixty degrees, limited by a shoulder on each side. A dove-tailed key holds it in place, and it can in a few minutes be unshipped, if necessary, and a duplicate bow adjusted. The flukes, of course, move together, and both hold at once. A slight twist of each, in opposite directions from the plane of the bow, something like the twist of a fish-hook, causes one of the two to take hold at once, when the hutt of the shank is raised by traction upon the cable, whichever side up the anchor may be lying; and the moment one catches, the other must immediately follow. The advantages claimed for this anchor are as follows: 1st, the necessity for the awkward stock or cross-piece of the old style is completely done away with; 2d, there is no possibility that the anchor can be "tripped" by becoming "fouled" with its own chain, the flukes presenting no angular points which might catch; 3d, it need not be as heavy as the old anchor, inasmuch as both flukes hold at once; and 4th, when hoisted to its place on the bow, it lies neatly against the side of the vessel, with no protruding stock to interfere with anything either upon its own deck or that of another vessel alongside. Messrs. Lloyd & Stewart are San Franciscans. They have applied for a patent through the agency of the MINING AND SCIENTIFIC PRESS.

THE TERMINAL CENTRAL PACIFIC RAILROAD CO., has recently been organized in this city, with a capital stock of four millions of dollars, for the purpose of constructing a railroad between Goat Island and Vallejo. The names of Alpheus Bull, R. B. Swain, R. E. Cole, J. Mora Moss, J. P. Flint, H. D. Bacon, W. H. L. Barnes, R. W. Kirkham, John Bensley, Alfred L. Tubbs, and Edward P. Flint, appear in the articles of association. The survey is already commenced. The plan is to cross the straits of Carquinez by a bridge, nearly 3,000 feet in length. For a time, however, a ferry-boat will be used. The distance from Goat Island to Sacramento is ninety miles. When this road is completed, the trip will be made in about three hours.

(Special Notice.)

## WESTERN LIFE INSURANCE.

[An extract from the *Lancashire Mail* and *Wall Street Review*, published in New York City, in January, 1867.]

Life Insurance, the crowning triumph of modern science and philanthropy, has, we are happy to state, joined and kept pace with the westward march of civilization and enterprise.

We had, at the recent Convention of Life Insurance companies in this city, the pleasure of renewing our acquaintance, began at the first Convention five years ago, with Secretary Kellogg, of the Northwestern Insurance Company, holding its headquarters at Milwaukee, Wisconsin, and were agreeably surprised to learn from him that this institution has already fifteen thousand members, assets approximating to two millions of dollars, and yearly receipts amounting to nearly a million. Having, from year to year, marked in the Massachusetts reports its rapid growth, we had regarded it, of all Life companies west of the seaboard cities, as the leading one, but were hardly prepared to find it rank so high among the strongest and foremost life institutions of America.

Upon a close investigation of the Northwestern's system, we are compelled to admit that its great success is founded on its superior and faithful management, the express object of which has been to render the interests of the members identical with those of the company, and never to suffer the corporate organization to become a distinct or opposite influence to that of the individual policy holder. It appears to have risen to the broad, generous, democratic platform of equal rights and privileges, and to recognize the great truth that each member of the company is the *bona fide* owner of his *pro rata* proportion of its assets, and entitled to treatment in accordance with the fact. The Northwestern, deeply impressed, and starting with this fundamental truth, that in a mutual company the members are the company, conceives that it has improved somewhat upon Eastern notions in this respect, and has, in order to fully realize its ideas of right, made, among others, the following provisions: That the association is purely mutual, managed on the policy-holders, by trustees elected by and from its own members, thus precluding the existence of conflicting or separate interests. Secondly, that as each policy-holder, if dissatisfied, is allowed to take his share of the funds—that is, receive at any time the surrender value of his policy and retire, the company retains no involuntary members.

The method, according to which its business is conducted, is what Mr. Wright terms the cash plan. For, though each member is allowed to pay all cash, or to give part note for his policy, whether it be large or small, the note is limited to the surrender value of the policy at the end of each year, so that if the note policy-holder resigns his membership at the conclusion of the term, he takes merely the same sum that would be paid to the cash member withdrawing, and thus the company, although it accepts notes, cannot be said, in any fair sense of the term, to do a credit business. With the Northwestern, the first payment on a term premium policy secures its proportion of that policy as effectually as any subsequent one, and all surplus is divided equitably among the policy-holders according to their respective contributions to such surplus. The dividends, after they are made, belong absolutely to the policy-holders, and are not forfeitable, as in most companies, by discontinuance of payment of regular premiums. These dividends are paid in cash, endorsed on notes, or applied to increase the policy, either temporarily or permanently.

A member may at any time borrow of the company the surrender value of the policy, which is his share of the funds, and thereby often save his policy from forfeiture; or, if the policy has been in existence some years, use the money in business, or for any other purpose in time of urgent need.

Many other provisions might be cited, but the preceding will suffice to show that the Northwestern is managed upon broad and enlightened principles, for the exclusive benefit of the policy-holders, their heirs and assigns.

Its location in the West, where capital is in demand at high rates, and where it is claimed that the rate of mortality is low, appears to have contributed not a little to the prosperity of this company. We are informed by the Secretary, that the dividend for 1867, upon life policies which have been in existence seven years, will reach as high as fifty-four per cent., and upon those in force for three years, will run up to nearly fifty per cent.

Flourishing as its present condition appears, the Northwestern's prospect for future years is still brighter, and we trust it will be fully realized, for its triumph is the triumph of good will to mankind and of benevolent providence exercised in behalf of the widow and orphan, the bereaved and desolate, who have most need of aid, comfort and protection.

## HENDY'S LATEST IMPROVED CONCENTRATORS,

FIG. 1.

FIG. 2.

## FOR GOLD AND SILVER ORES,

With Revolving Stirrers and Rotary Distributor.

Can be seen in Operation at the Union Foundry, First St., San Francisco.

Fig. 1 is a sectional view. H is the support for upper end of shaft, marked B; L is the step; C, the hopper, in which the tailings are thrown; the tailings flow down the arm, K, then distribute at the Distributor, marked D. The tailings enter the pan, A, at its periphery, and the debris discharges near its center, and passes off in the spout, F. The sulphurets discharge at gate E; amalgam and quicksilver at plug I. J is a descending channel, for forcing the sulphurets, amalgam and quicksilver to their respective points of discharge; S is the sulphurets; M, the stirrers, with copper plate coated with mercury. The rotating of the stirrers prevents the sands from packing near the center of the pan, where the motion is diminishing. The pan, A, shows a curvilinear bottom, which gives a more precipitous descent near its center, for the purpose of forcing the sulphurets towards the periphery. It will be noticed that the centrifugal force and motion diminishes towards the center of the pan, for which reason the inclination is increased for the purpose above mentioned.

Upon the under side of the distributor are small openings or perforations, through which the pulp is dropped from the feeder into the pan.

The stirrers, marked M, and distributor, D, is made to sweep slowly around by means of the ratchet teeth upon the upper edge of the pan, in which two pawls are seen to work. This motion is obtained from the vibrating action of the pan. These pans can be so connected, as in Fig. 2, that two can be driven by one shaft and pulley.

The revolving stirrers and rotary distributor can be easily attached to Hendy's old Concentrators, and at a small expense.

These machines have been thoroughly tested, and pronounced a perfect success.

The proprietor of this Concentrator feels satisfied that it has no equal in use. It is designed for saving finely divided Quicksilver, Amalgam and Gold from the sands, and for concentrating and saving the Sulphurets, and is to be placed behind any and all other machines in use. Any person of ordinary experience with Quartz Mills can readily fit them up and run them.

The principle upon which HENDY'S PATENT CONCENTRATOR is constructed, is the only true and mechanical one for the purpose of concentration.

## CENTRIFUGAL FORCE AND GRAVITATION,

Combined as they are in this machine, CANNOT FAIL TO ACCOMPLISH the object sought.

Many certificates from proprietors of mills, who have this Concentrator in use, can be had, if required, giving the most flattering accounts of its efficiency.

A most substantial evidence of its worth is the fact that the proprietor is receiving repeated orders from those who are using them, and who have tested their merits.

Those in want of Concentrators would do well to visit some of the quartz mills that have Hendy's Patent Concentrators in use, and satisfy themselves before purchasing other Concentrators of pretended merit. THEY ARE WARRANTED TO WORK SATISFACTORILY.

## Directions for Operating Hendy's Concentrator.

The sulphurets are drawn off while the Concentrator is in motion, in the following manner:

FIRST—Set the Pan, A, level, by its inner rim.

SECOND—While in operation, keep the Pan, A, about half full of sulphurets. [See Figure 1, marked S.]

THIRD—Open the gate, E, sufficiently to discharge the sulphurets as they accumulate over the amount above mentioned.

FOURTH—The crank shaft to make 200 to 220 revolutions per minute.

## CAUTION.

All of HENDY'S PATENT CONCENTRATORS are marked thus:

"J. HENDY, Patented February 27th and April 17th, 1866."

Orders or letters of enquiry, address,

JOSHUA HENDY, Patentee,

Union or Fulton Foundry, San Francisco.

Feb. 1st, 1867.

Call and see them.

A. S. Hallidie & Co.,  
MANUFACTURERS OF  
FLAT & ROUND WIRE ROPE.

For Mining, Shipping, Ferry,  
AND GENERAL PURPOSES.

Office—412 Clay Street, Works—North Beach.

NOTICE.—THE FIRST COST OF WIRE ROPE IS MUCH less than that of any other kind of Rope of equal strength, and it is four times as durable. Wire Rope does not stretch or shrink by atmospheric changes; it has but one-fifth the bulk of Hempen Rope; is spliced and repaired in the same manner.

The attention of Mining Companies is particularly called to our Flat and Round Hoisting Ropes, which have been in use for a number of years by the leading mines on this Coast, and many of whom we refer those interested as to the great advantages over any other kind of rope; effecting an immense saving in expenditure for ropes, fuel, wear and tear of machinery, stoppage of works, etc., besides increasing safety of life.

Mining Companies, in erecting Hoisting Works, should be sure and have their drums and pulleys of sufficient size, whether for wire or hempen rope.

We manufacture of all sizes, and in any length—  
Round Wire Rope—Iron or Steel, for Hoisting.

Flat Wire Rope—  
Soft Steel Wire Rope—For Derrick Fall Ropes—very strong and durable—one third the weight of hempen of equal strength, (saving in freight for remote localities), suitable sheaves and blocks furnished when required.

Galvanized or Ungalvanized Round Wire Rope—For ships' Rigging, Derrick Gays, Ferry Ropes, and all standing purposes.

Steel Ferry Ropes—For wide streams, Ferry Blocks supplied.

Iron and Copper Wire Cord— $\frac{1}{2}$  to  $\frac{1}{4}$  inch diameter, for hanging window shades; Signal Cord; Sash Pulleys on hand.

Compare Weight, Size and Strength of Iron Wire Rope, Steel Wire Rope, Hempen Rope, and Chain.

Established in 1849--Corner First and Mission streets, San Francisco.

HAVING INCREASED OUR FACILITIES IN EVERY DEPARTMENT, WE ARE NOW prepared at the shortest notice and at the most reasonable rates, to furnish all kinds and description of Machinery, including Steam Engines, Quartz Mills, Mining Pumps of all kinds, Hoisting Gear, Gas Work, Laundry Machinery, Architectural and Ornamental Castings, Sugar Mills, Saw and Flour Mills, Water Wheels of all kinds, Hydraulic Hay, Rags, Serew and Drop Presses, Coining Machinery, Pile Drivers, Bark and Malt Mills, and all kinds of Castings.

**ENGINES.**—Marine Engines, Oscillating and Beam; Stern and Side Wheel Boats, Locomotives, Stationary Engines, Horizontal, Upright, Oscillating and Beam, from six to fifty inches diameter. Also, Scott & Eckart's Adjustable Cut-off Regulator—best in use; W. R. Eckart's Balance Valve for Stationary Engines; Woodward's Patent Steam Pumps and Fire Engines.

**BOILERS.**—Locomotive, P, ae, Tubular, Upright, Cylinder and Cornish, and every variety of Boiler Work. All sizes of tubes and pipes for pumps.

**PUMPS.**—The Excelsior double-acting Force Pumps are manufactured by us. These very superior Pumps are warranted the best, and are fast replacing all other Force Pumps.

**AMALGAMATING MACHINERY.**—Wheeler & Randall's Improved Tractory Curve Pan, Zenas Wheeler's Improved dat bottom pan, Beldin's pan, Yeatch's tubs, Prater's concentrators, Waklee's pans, Beers' pan, German Barrels, Arastra Clearing, Chile Mills, Settlers of all descriptions, Retorts of all sizes and shapes, for Silver and Gold, Portable Stamp Mills, Straight Batteries, for wood or iron frames, Dry Crushing Batteries, or machines with the latest improvements, every variety of Stamps, Mortars, Cams, Pans and Tubs. BLAKE'S PATENT QUARTZ CRUSHERS, of all sizes.

**OIL BORING TOOLS AND MACHINERY.**—Of the latest and most approved construction, made from drawings lately made by Prof. Blake at the oil wells in Pennsylvania. We have the facilities for working gold and silver quartz and other ores, to test their value, by the hundred weight or ton.

Russia Iron Sereens, of all degrees of fineness and of all qualities of iron. All work done in the best manner at the lowest cash prices.

RHUBARB WINE.—A correspondent of the American Institute says, if anybody expects to make money by planting rhubarb for wine, he will assuredly make a fool of himself. A few years ago, a great deal was said about rhubarb wine in this State; several of our friends invested considerable in the speculation, one of whom sent us a bottle of the wine, which he said was very good—it lacked only age to make it excellent. We are no judge of wine, and innocently thought it might be so; but it spoiled our mince pies. We have heard but little of rhubarb wine for the last three years. We have also heard it said that better wine can be made out of burned peaches and logwood, and for a quarter of the money that it costs to make rhubarb wine. How is it; has any one succeeded in making a good article of rhubarb wine in this State? If so, we should like to be advised of the fact, so that we can report progress.

TUNING FORKS are raised in pitch by filing off a portion of the end of each branch, and lowered or flattened by filing off a portion of the side of each branch. The pitch of a given steel fork is not changed in the slightest degree by being hardened and then softened, or vice versa.

## Metallurgy.

## Pacific Chemical Works.

**FALKENAU & HANKS,**  
Desiro to call the attention of Druggists, Manufacturers,  
Metallurgists, Millmen, Assayers, Chemists and  
Students, to their

**ANALYTICAL LABORATORY,**  
And Establishment for the manufacture of Pure Re-agents,  
**Pharmaceutical Preparations,**  
And all CHEMICALS used in the Arts. They are prepared  
to make Chemical investigations,  
**Analyses and Assays,**  
Of every description, and to give advice upon all matters  
pertaining to Technical Chemistry.

Office, 629 Washington street; Laboratory, Corner of  
3v14-1t Center and Polson streets.

**BOALT & STETEFELDT,**  
Metallurgists and Mining Engineers

**AUSTIN, NEVADA.**  
Western Branch of ADELBERG & RAYMOND, No. 90  
Broadway, New York. 1v11

**G. W. MAYNARD, J. H. TIEMANN,**  
**MAYNARD & TIEMANN,**  
Mining Engineers and Metallurgists,  
240 Pearl street, New York,  
—AND—  
CENTRAL CITY, COLORADO.  
1v12-1y

**EUROPEAN**  
**METALLURGICAL WORKS,**  
—AND—  
Practical Mining School,  
Bryant Street, Between Third and Fourth,  
SAN FRANCISCO.

THE Proprietors are at all times prepared to work or test  
Ores sent to this establishment—either in large or small  
quantities—by such process as may be found best adapted to  
their chemical character, after a careful analysis has been  
made. Test lots of Ore adapted to the smelting process at-  
tended to. Sulphur, pyrites, and the (so-called) "rebel-  
lous ores," are having especial attention paid to their suc-  
cessful treatment. Assaying in the humid and dry way.  
Also, roasting by calcination, done at moderate rates.

**PRACTICAL MINING SCHOOL.**  
The proprietors—encouraged by numerous applications  
from gentlemen desirous of pursuing the study of practical  
metallurgy—have concluded to admit parties on reasonable  
terms. Having in their Mill all the necessary appli-  
ances for crushing, roasting, amalgamating, smelting, re-  
fining and assaying, as also a well extended Laboratory for  
the analysis of Ores and Minerals, a good opportunity is  
here offered to acquire a sound practical knowledge of the  
business.  
S. P. KIMBALL, J. R. MURPHY,  
1v10-1t

**MOSHEIMER'S**  
**Metallurgic Works**  
And Practical School for Assaying  
and Metallurgy.

THE UNDERSIGNED HAS REOPENED METALLUR-  
gic Works, and is prepared to reduce any kind of Ores,  
by Smelting, Amalgamating, or other processes, that the  
nature of the ore may require.  
Practical instructions given in Assaying, all branches of  
Metallurgy and Technology.  
Furnishes Plans and Estimates for the erection of Quartz  
Mills, Smelting and other Reduction Works.  
Having carefully studied the science of Concentrating  
Ores, I can offer better concentrating machinery than any  
in use in California, and especially such as will save the  
fine or floating gold and sulphurates.  
CONSULTATION OFFICE:  
328 Montgomery street, San Francisco.  
**J. MOSHEIMER,**  
25v13-3m Engineer and Metallurgist.

**Pacific Mail Steamship Co's**  
**THROUGH LINE TO NEW YORK,**  
Carrying the United States Mail.

LEAVE POLSON STREET WHARF, AT 11  
o'clock A. M. of the following dates, for  
PANAMA, connecting via Panama Railroad, with one of  
the Company's splendid steamers from ASPINWALL for  
NEW YORK.  
On the 10th, 18th and 30th of each month that has  
30 days.  
On the 10th, 18th and 30th of each month that has  
31 days.  
When the 10th, 18th and 30th fall on Sunday, they  
will leave on Saturday preceding; when the 18th falls on Sun-  
day, they will leave on Monday following.  
Steamer leaving San Francisco on the 10th touches at  
Manzanillo. All touch at Acapulco.  
Departures of 18th or 19th connect with French Trans-  
Atlantic Co.'s steamer for St. Nazaire, and English steamer  
for South America.  
Departure of 10th connects with English steamer for  
Southampton, and P. R. R. Co.'s steamer for Central  
America.  
Departure of the 30th connects with English steamer for  
Lima, the port of the new mines.  
The following Steamships will be dispatched on dates as  
given below:  
March 8th—SACRAMENTO, Capt. J. M. Cavarly,  
Connecting with HENRY CHAUNCEY, Capt. Gray.  
March 19th—CONSTITUTION, Capt. W. F. Lapidge,  
Connecting with PANAMA, Capt. Maury.  
March 30th—COLDEN AGE, Capt. Jas. T. Watkins,  
Connecting with the RISING STAR, Capt. Furber.  
Cabin passengers berthed through. Baggage checked  
through—100 pounds allowed each adult.  
An experienced Surgeon on board. Medicine and attend-  
ance free.  
These steamers will positively sail at 11 o'clock. Passen-  
gers are requested to have their baggage on board before 10  
o'clock.  
Through Tickets for Liverpool by the Inman Line, can be  
obtained at office, P. M. S. S. Co., San Francisco.  
For Merchandise and Freight apply to Messrs. WELLS,  
FAROE & CO.  
The splendid steamship COLORADO will be dis-  
patched on WEDNESDAY, April 3, 1867, for Hongkong, via  
Kauagawa, carrying passengers, mails and freight.  
For passage and all other information, apply at the Pa-  
cific Mail Steamship Co's office, corner of Sacramento and  
Leidesdorff streets.  
**OLIVER ELBRIDGE, Agent.**

**City College Laboratories,**  
Southeast Cor. Stockton and Geary sts.

**Practical and Analytical Chemistry**  
and Metallurgy.

**THOMAS PRICE,**  
Professor of Chemistry,  
(Formerly of the Normal College, Swansea.)

WILL GIVE PRACTICAL INSTRUCTIONS IN QUALI-  
tative and Quantitative Analysis and Assaying. The  
course qualifies students for the application of Chemistry  
to METALLURGY, MANUFACTURING ARTS, and MINING  
PURPOSES.  
PHARMACEUTICAL and TECHNICAL CHEMISTRY,  
as is required by Medical and Pharmaceutical Stu-  
dents, will be taught to such students as may require it.  
Course of General Chemistry.

Evening Lectures will be delivered every Tuesday, at  
half past seven o'clock, P. M., in the Philosophical Hall of  
the College, without extra charge to the students in the In-  
stitution.  
On and after the 14th of February, the Laboratories will  
be open every day, except Sundays, from 8 A. M. to 5 P. M.  
For further particulars, address

**REV. P. V. VEDER,**  
Principal of the City College.  
Or at 406 California Street.  
6v12-2wtf

**Our Circulation.**—The Mining and Scientific Press  
has a large and permanent subscription list, and enjoys a  
more universal circulation among stockholders and per-  
sons directly interested in mining than any other paper on  
this coast.

## Subscribe at Once!

From the commencement of Volume XIV of the MINING  
AND SCIENTIFIC PRESS, only a limited number of copies will  
be saved for files by us; consequently those who desire the  
paper its for future as well as present value, should sub-  
scribe at once.

**Important to Californians.**—Many inventors have  
lately had their claims for Patents seriously (and in some  
cases fatally) delayed by the unqualification of agents who  
have not complied with the Government license and revenue  
laws, as well as other new and imperative regulations.  
These discrepancies, although arising from the inexperience  
of honest agents, are none the less dangerous to applicants  
for patents, whose safest course is to trust their business  
with none but active and experienced solicitors. THE MIN-  
ING AND SCIENTIFIC PRESS PATENT AGENCY has strictly com-  
plied with the regulations of the Department, and properly  
filed all necessary papers as Claim Agents.

## Important to Secretaries.

Secretaries will please write proper names and figures  
distinctly, and hand in their advertisements as early in the  
week as practicable. Our latest forms go to press Friday  
evening. Any information concerning the requirements of  
the laws regarding advertisements will be cheerfully given  
when solicited. Inspect all your notices carefully upon  
their first appearance. In case of postponement, give the  
earliest notice possible at the office. When copy is received  
sufficiently early, a proof-sheet will be furnished if desired.  
A revised copy rendering for advertising at the mine, when  
requested. Neatly printed copies of advertisements, for  
serving individual notice to stockholders, printed at \$1 per  
hundred. Copies of the new advertising law, as officially  
published, furnished gratuitously. For Blank forms, for  
filling out Assessment Notices and Delinquent Sales, sup-  
plied free to advertisers in the MINING AND SCIENTIFIC PRESS  
on application at the office.  
**DEVEX & CO., Publishers.**  
505 Clay street, corner Sansome, San Francisco.

## New Mining Advertisements.

**Big Blue Lead Gold and Silver Mining Com-**  
pany, Cove District, Kern County, California.

Notice is hereby given, that at a meeting of the Board of  
Trustees of said Company, held on the nineteenth day of  
February, 1867, an assessment of five dollars per share was  
levied upon the capital stock of said Company, payable  
March fourteenth, 1867, in United States gold and silver  
coin, to the Secretary, at his office, No. 302 Montgomery  
street, San Francisco, Cal.  
Any stock upon which said assessment shall remain un-  
paid on the second day of April, 1867, shall be deemed  
delinquent, and will be duly advertised for sale at public  
auction, and unless payment shall be made before, will be  
sold on Tuesday, the twenty-third day of April, 1867,  
to pay the delinquent assessment, together with costs of  
advertising and expenses of sale. By order of the Board  
of Trustees.  
M. C. ELMORE, Secretary.  
Office, 302 Montgomery street, San Francisco. n12

**Cherokee Flat Blue Gravel Mining Company,**  
Cherokee Flat, near Oroville, Butte County, California.

Notice.—There are delinquent, upon the following de-  
scribed stock, on account of assessment levied on the  
twenty-fourth day of January, 1867, the several amounts  
set opposite the names of the respective shareholders, as  
follows:

Names.	No. Certificate.	No. shares.	Amount.
Mrs N. Gorman.....	not issued	2	\$20 00
J. H. Wilcox.....	27	8	40 00
Mrs E. Clark.....	27	3	15 00
E. R. West.....	23	3	15 00
Henry Poppe.....	16	7	35 00
Hedley Knight.....	not issued	10	50 00
Ernest Poppe.....	20	5	25 00
W. H. Rhodes.....	11	16	80 00
S. B. Straus.....	22	3	15 00
A. S. Randall.....	19	5	25 00
P. C. Heringer.....	not issued	5	25 00
Mrs M. A. Willis.....	not issued	1	5 00
Edward Hunt.....	8	10	50 00
E. W. Smith.....	5	7	35 00
Miss S. Bryant.....	not issued	1	5 00
Pascal Loums.....	not issued	1	5 00
L. Schmidt.....	not issued	2	10 00
J. Behrens.....	not issued	5	25 00
J. P. Flint.....	not issued	5	25 00
J. N. Sanford.....	4	8	40 00
W. Buck.....	not issued	16	75 00
G. A. Jones.....	not issued	2	10 00
G. S. Stillman.....	not issued	7	35 00
Miss A. B. Shattuck.....	not issued	1	5 00
E. P. Flint.....	not issued	1	5 00
T. B. Howard.....	3	4	20 00
J. de la Montagne.....	not issued	4	20 00
J. T. Swift.....	not issued	4	20 00
H. Meheis.....	not issued	4	20 00
O. W. Bell.....	not issued	3	15 00

And in accordance with law, and an order of the Board  
of Trustees, made on the twenty-fourth day of January,  
1867, so many shares of each parcel of said stock as may  
be necessary, will be sold at public auction, by Maurice  
Dore & Co., at their salesrooms, No. 327 Montgomery street,  
San Francisco, California, on the eighteenth day of March,  
1867, at the hour of 12 o'clock M. of said day, to pay said  
delinquent assessment thereon, together with costs of ad-  
vertising and expenses of sale.

A. DE SENAHLAC, Secretary.  
Office, southeast corner of Jackson and Montgomery  
streets, (up stairs) San Francisco, Cal. n12

**Hope Gravel Mining Company.**—Location of  
Works and Property: Grass Valley, Nevada County, Cal-  
ifornia.

Notice is hereby given, that at a meeting of the Board of  
Trustees of said Company, held on the twenty-fifth day of  
February, 1867, an assessment (No. 13) of one dollar (\$1) per  
share was levied upon the capital stock of said Company,  
payable immediately in gold coin of the United States, to  
the Secretary, at the office of the Company, No. 523 Clay  
street, San Francisco.  
Any stock upon which said assessment shall remain unpaid  
on Wednesday, the third day of April, 1867, shall be deemed  
delinquent, and will be duly advertised for sale at public  
auction, and unless payment shall be made before, will be  
sold on Monday, the twenty-second day of April, 1867,  
to pay the delinquent assessment, together with costs of  
advertising and expenses of sale. By order of the Board  
of Trustees.  
DAVID WILDER, Secretary.  
Office, No. 523 Clay street, corner of Leidesdorff street,  
San Francisco, Cal. n12-5w

**Nuestra Señora de Guadalupe Silver Mining**  
Company, Tayoltita District, Durango, Mexico.

The Annual general Meeting of said Company, for the  
election of Trustees for the ensuing year, will be held on  
MONDAY, the fourth day of March, 1867, at 8 o'clock  
P. M., at the office, No. 210 Post street, San Francisco.  
Proxies must be in writing, and ten cents stamp affixed.  
mar2-1t E. J. PFEIFFER, Secretary.

**San Marcel Silver Mining Company.**—Loca-  
tion of Works: San Marcel, District of Hermosillo, State  
of Sonora, Mexico.

Notice is hereby given, that the Annual Meeting of the  
shareholders of the above named Company, will be held on  
TUESDAY, the eighteenth day of March, 1867, at 7½  
o'clock P. M. of that day, at the office of the Company, No.  
331 Montgomery street, San Francisco, for the election of  
Trustees to serve the ensuing year, and for the transaction  
of other business.  
R. N. VAN BRUNT, Secretary.  
Office, 321 Montgomery street, San Francisco. n12

**Yosemite Mining Company, Oro Fino District, Humboldt County, Nevada.**

Notice.—There are delinquent, upon the following described stock, on account of assessment levied on the twenty-sixth day of January, 1867, the several amounts set opposite the names of the respective shareholders, as follows:

G. W. HUNNELL, Secretary.

Office, No. 611 Clay street, San Francisco. feb6

**Caution!**

**Cosima Silver Mining Company.**—The following Certificates of Shares in the Capital Stock of the above named Company, were sold to pay delinquent assessment and expenses of advertisement and sale, on the eleventh day of February, 1867, at the auction rooms of Maurice Dore & Co., 331 Montgomery street, San Francisco, at twelve o'clock, noon:

In name of.	No. Certificate.	No. Shares.
P. J. Bragan.	666	25
James Laddley.	662	25
James Laddley.	663	133
James Laddley.	664	133
J. D. Thompson.	655	25

Parties are hereby cautioned against purchasing the above described Certificates of Stock.

CHAS. RAUM, Secretary.

Office, No. 540 Battery street, opposite the Custom House, San Francisco, Cal. feb14

**Cumargo Gold and Silver Mining Company, Lander County, Nevada.**

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the fourteenth day of February, 1867, an assessment of twenty dollars per share was levied upon the capital stock of said Company, payable immediately, in United States Currency, to the Secretary, 402 Front Street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the twenty-ninth day of March, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the twenty-first day of May, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

N. C. FASSETT, Secretary.

Office, 402 Front street, San Francisco. feb16

**Chilpaneca Mining Company—District of Ures, Sonora, Mexico.**

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the thirtieth day of January, 1867, an assessment of five dollars (\$5) per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, 316 California street, (up stairs) San Francisco, California.

Any stock upon which said assessment shall remain unpaid on the eighth day of March, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twenty-ninth day of March, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

JOHN F. LOHSE, Secretary.

Office, 316 California street, San Francisco. Cal. feb2

**Chalk Mountain Blue Gravel Company.—Location of Works: Nevada County, California.**

Notice.—There are delinquent upon the following described stock, on account of assessment levied on the tenth day of January, 1867, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
E. C. Lomb.	15	10	\$150 00
Isaac Swain.	16	25	150 00
Martha White.	17	25	200 00
S. B. Whipple.	18	25	75 00

And in accordance with law, and an order of the Board of Trustees, made on the tenth day of January, 1867, so many shares of each parcel of said stock as may be necessary will be sold at public auction, at the salesroom of Messrs. Olney & Co., at No. 418 Montgomery street, San Francisco, California, on Saturday, the ninth day of March, 1867, at the hour of 12 o'clock, M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

J. M. BUFFINGTON, Secretary.

Office, No. 5 Government House, corner Washington and Sansone streets, San Francisco, California. feb23

**Diamond Copper Mining Company. Location: Rockland District, Del Norte County, California.**

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the fourth day of February, 1867, an assessment of two dollars (\$2) per share was levied upon the capital stock of said Company, payable immediately in United States gold coin, to the Secretary, at the office of the Company, Room No. 33 Montgomery Block, San Francisco, or to ROY B. RANDALL, the Company's Superintendent, at Crescent City, Del Norte County, California.

Any stock upon which said assessment shall remain unpaid on Saturday, the ninth day of March, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the first day of April, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

Office, Room No. 33 Montgomery Block, corner of Montgomery and Washington streets, San Francisco, Cal. feb9

**Emilia Mining Company, State of Guerrero, Mexico.**

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twelfth day of February, 1867, an assessment of seventy-five cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, Room No. 1 Crim House, No. 523 Kearny street, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on the twenty-second day of March, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the eighth day of April, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

MAX. BURKHARDT, Secretary.

Office, Room No. 1 Crim House, No. 523 Kearny street, San Francisco, Cal.

N. B.—The above assessment is levied in place of the assessment levied October 20th, 1865, which was revoked at a meeting of the Board of Trustees, held February 20th, 1867. All stockholders who have paid on the said assessment levied October 20th, 1865, will be credited the amount so paid on the assessment of February 20th, 1867. By order of the Board of Trustees.

MAX. BURKHARDT, Secretary.

**Evcon Consolidated Copper Mining Company.**

Location of Works: Court Hill District, near Black's Ferry, Del Norte County, California.

Notice.—There are delinquent, upon the following described stock, on account of assessment levied on the fourteenth day of January, 1867, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	Number of Certificate.	Number of Shares.	Amount.

And in accordance with law, and an order of the Board of Trustees, made on the fourteenth day of January, 1867, so many shares of each parcel of said stock as may be necessary will be sold at public auction, by Messrs. Olney & Co., at No. 418 Montgomery street, San Francisco, Cal., on the thirteenth day of March, 1867, at the hour of 2 o'clock, P. M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

R. S. CLYDE, Secretary.

Office of Company, No. 532 Merchants street, Room No. 3, San Francisco, California. feb3

**George Washington Gold and Silver Mining Company.—Location of Works: Silver Mountain District, Alpine County, Cal.**

Assessment No. 77.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the fifth day of February, 1867, an assessment of three dollars and fifty cents (\$3.50) per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary, at the office of the Company, only.

Any stock upon which said assessment shall remain unpaid on the ninth (9th) day of March, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twenty-ninth day of March, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

A. G. WOOD, Secretary.

Office, 233 Montgomery street, San Francisco. feb9

**Julia Gold and Silver Mining Company, Storey County, Nevada.**

Notice.—There are delinquent, upon the following described stock on account of assessment levied on the tenth day of January, 1867, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
Capron, P.	29	50	\$50 00
Botardo, J.	181, 182, 25-ca	50	50 00
Lansweert, L.	37	20	20 00
M. J. McLaughlin.	155, 156, 25-ca	50	50 00
Whipple, J.	39	20	10 00

And in accordance with law, and an order of the Board of Trustees, made on the tenth day of January, 1867, so many shares of each parcel of said stock as may be necessary will be sold at public auction, by Maurice Dore & Co., No. 331 Montgomery street, San Francisco, California, on the sixth day of March, 1867, at the hour of 2 o'clock, M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

A. NOEL, Secretary.

Office, 607 Washington street, San Francisco, Cal. feb16

**Postponements and Alterations.**—Secretaries are requested to give notice of postponements, or alterations which they may desire made in their advertisements at their earliest convenience. New advertisements should be sent in as early as possible.

**Kern River Gold and Silver Mining Company, Kern District, Kern County, California.**

Notice.—There are delinquent upon the following described stock, on account of assessment levied on the third day of January, 1867, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
A. Staples.	37	30	\$30 00
F. H. Staples.	32	30	30 00

And in accordance with law, and an order of the Board of Trustees, made on the third day of January, 1867, so many shares of each parcel of said stock as may be necessary will be sold at public auction, at the Company's office, No. 312 Montgomery street, San Francisco, Cal., on the twelfth day of March, 1867, at the hour of 12 o'clock, M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

M. G. ELMORE, Secretary.

Office, No. 312 Montgomery street, San Francisco. feb3

**Libertad Gold and Silver Mining Company, District of Ures, Sonora, Mexico.**

The stockholders of the above-named Company, are notified to attend the Annual Meeting thereof, which will be held in the Fourth District Court Room, City Hall, on WEDNESDAY EVENING, March 6th, 1867, at 7½ o'clock.

LAWRENCE C. OWEN, Secretary.

**Lady Bell Copper Mining Company, Low Divide Mining District, Del Norte County, California.**

Notice.—There are delinquent, upon the following described stock, on account of assessment levied on the eleventh day of January, 1867, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
J. Y. Ayers.	96	25	\$2 50
Francis Chummins.	135	10	1 00

## Machinery.

# STEWART'S CELEBRATED HINGED Grinder and Amalgamator.

Is the Cheapest and Quickest Pan

Now used. It is flat-bottomed, loses far less power in throwing the pulp, and circulates the same under the miller to better advantage than any other Pan in use, while the steam, owing to the thinness of the cone, has a more direct effect in heating the pulp. E is the miller plate; F the Grinding Shoe, attached by an adjustable hinge joint in the middle of the same—the bottom wearing down even with the dies.

Mr. J. H. STEWART, the inventor, has had ten years of experience in mechanical operations, and may be addressed at San Francisco, or called on at the Miners' Foundry, First street, where his Pan is manufactured, and is to be seen at any time in operation. 5v13f

# HUNTER'S IMPROVED CONCENTRATOR.

THE INVENTOR OF THE ABOVE RECENTLY IMPROVED Machine, is now prepared to take contracts for concentrating gold or silver ore on shares, receiving a certain per cent. of the sulphurets as may be agreed upon; and will guarantee twenty per cent. more sulphurets than from any rocker or concentrator built on the Pacific coast, saving at least ninety per cent. of the sulphurets contained in the ore. The sulphurets, if desired for shipping, will contain less than one per cent. of sand.

Persons who have sulphureted ores will do well to have their sulphurets saved; as the many failures in mining can often be attributed to the waste of sulphurets. For particulars, address

One of these Machines can be seen in operation at the Union Foundry, in this city, up stairs.

ANDREW HUNTER, Inventor,  
22v13-3m San Francisco.

# VARNEY'S PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as follows:

The pan being filled, the motion of the miller forces the pulp to the center, where it is drawn down through the aperture mid between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setters made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with the quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the  
PACIFIC FOUNDRY,  
1v1 San Francisco.

# Steam Pumps,

FOR DRAINING MINES OR ELEVATING WATER TO ANY HEIGHT.

PICKERING'S GOVERNORS

For Steam Engines.

Giffard's Injectors,  
For Feeding Boilers.

STODDART'S IRON WORKS,  
Beale Street, San Francisco.

# STANDARD SOAP COMPANY'S WASHING POWDER.

THIS POWDER IS SUPERIOR TO ALL OTHER PREPARATIONS for washing and cleansing. It is made of pure material and contains nothing that will injure the finest fabric. Equally as good for use in hard as soft water. One pound will make three gallons of beautiful soft soap. Put up in wrappers of 1-lb each, and in wooden boxes of 10-lb bulk. Ask your grocer for a package, and test its virtue. Manufactured at 207 Commercial street, San Francisco. 15v12q

# Brown's Filtering Heater!

FOR PREVENTING INCrustation IN STEAM BOILERS, purifies water from lime or any other impurity, saves fuel, saves the boiler, prevents explosions, and protects life and property. The cost of the Filter is soon saved in fuel and boiler-repairs alone.

One is in operation at the San Francisco Foundry, Fremont street, where Rights can be procured, or all needed information, on application, in person or by letter, to 5v14-y AUSTIN A. WELLS, Agent.

# BLAKE'S QUARTZ BREAKER! PRICES REDUCED!

MACHINES OF ALL SIZES FOR SALE

## Brodie's Patented Improvements

FOR THE TREATMENT OF

# Gold and Silver Ores.

BRODIE'S PATENTED IMPROVED QUARTZ CRUSHER.

The attention of all interested in Mining is respectfully called to this Improved Machine for Breaking or Spalling Quartz, or other Rock, possessing, as it does, simplicity of action and lightness of construction, so far as is compatible with strength and durability. In consequence of these advantages, the advertisers are enabled to offer these machines to the public at the following low terms:

No. 1.—Or 10-inch Crusher, capable of reducing from three to four tons of quartz per hour, no piece being larger than a walnut—price.....\$600  
No. 2.—Or 15-inch Crusher, capable of similarly putting through five to six tons per hour.....850  
No. 3.—Or 18-inch Crusher, will in a similar manner crush from seven to eight tons per hour.....1,200

EXPLANATION OF THE ABOVE ENGRAVING.

The frame is made of cast iron, bound with heavy wrought iron bands, making it very strong, and at the same time light and portable. The crusher is bolted to a wood frame of sufficient height to clear the fly-wheel, and allow the crushed quartz to pass off. The dotted lines show the movable and stationary jaws. Letter A represents the eccentric shaft by which the power is applied direct to the movable jaw. B represents the movable jaw, and C the fixed jaw. D represents the link or radius bar. E represents the bolts for regulating the opening. F, which can be regulated at pleasure, so as to graduate to the size to which it is intended the quartz shall be crushed. G represents the feed opening, by which the size of the machine is designated.

The arrow on the fly-wheel shows the direction to drive the eccentric, which, in combination with the link, D, gives the movable jaw, B, a forward and downward motion at the same time, and which makes the hardest rock yield and separate into fragments of any desired size.

The above Crushers have been recently erected and are now successfully employed at Bear Valley, Mariposa county, Rawhide Ranch, Tehuacum county, Excelsior Mine, Lake District, Nevada county, and can be seen in operation at the Fulton Foundry, First street, San Francisco.

The following testimonial respecting the effectiveness of this Crusher, has been received from the Superintendent of the "Rawhide Ranch" Mine, in Tehuacum county:

RAWHIDE RANCH, Tehuacum Co., Sept. 25, 1866.  
JAMES BRODIE, Esq., San Francisco—My Dear Sir: It gives me pleasure to inform you that I have for the past three months had one of your largest sized Rock Crushers in use, at the Rawhide Ranch Mining Company's Mill, which has entirely met my expectations; and I have no hesitation in recommending it to all who are in need of a machine for rapidly, cheaply and properly preparing quartz for the stamps. Yours truly,  
Supt. Rawhide Ranch Quartz Mill.

BRODIE'S PATENT IMPROVED GERMAN AMALGAMATOR BARREL.—This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, in 1864. Further particulars will be afforded on application to the subscribers.

Those infringing the patent rights to the above Improved Barrel, are hereby informed that on and after the 1st November, 1866, the royalty charged for using the same will be reduced to the sum of \$100 per barrel.

A diagram, with explanations of this machine, will be found in the "Mining and Scientific Press," of September 29th, 1866.

BRODIE'S PATENT WIND-BLAST SEPARATOR FOR DRY CRUSHING.—This Dry Crusher has been found the most economical and effective mode of crushing ores in Mexico, California and Nevada. Diagrams and explanations afforded on application to the subscribers.

A drawing and full description of this machine will be found in the Mining and Scientific Press of Sept. 22d, 1866.

BRODIE & RADCLIFF,  
Express Building, 402 Montgomery street, San Francisco.

# BRUCKNER'S Mechanical Roasting Furnace

AWARDED A

# PREMIUM SILVER MEDAL

—BY THE—

The Mechanics' Institute.

Patented December, 1865.

THESE FURNACES ARE NOW MANUFACTURED AFTER an Improved mode of construction, which

GREATLY SIMPLIFIES THEIR OPERATION,

and afford a much larger oxidizing surface to the action of heat and atmosphere.

The weight of a Furnace nine feet long by four feet in diameter does not exceed one ton.

# THE IMPROVED FURNACE

May be seen in operation, for desulphurizing or roasting and chloridizing, at Central Mill, Virginia City, Nevada.

Parties wishing to erect such Furnaces, are requested to leave their orders with

T. KALLENBERG,  
19v12 416 Market street, San Francisco.

# To Quartz Miners and Others.

# NOTICE!

I WISH TO CALL YOUR ATTENTION TO A PULVERIZER of my own invention, which I have called the

# HITCHENS' ORE PULVERIZER.

It is now in operation at the South Park Saw Mill, on Brannan street, between Third and Fourth streets. I am prepared to reduce, to an impalpable powder, quartz, sulphurets, tallings, cement, manganese, charcoal, sands, marble, plumbago, copper ores, etc.

In view of the importance of reducing ores, etc., to an impalpable powder, and being satisfied my invention to be a perfect success, I invite all interested in the subject examine it. Patent applied for.

Our Patent Agency.

THE PATENT AGENCY OF THE MINING AND SCIENTIFIC PRESS has been signalized with remarkable success during the past two years. The importance to the inventive genius of this coast of a thorough and reliable agency for the solicitation of LETTERS PATENT from the United States and foreign Governments cannot be over-rated, and the Proprietors of the Press, feeling the responsibility which rests upon them, and the reward which must follow the faithful performance of their trusts, will take care to afford inventors every advantage to be secured to them through a competent and responsible agency upon this coast.

# STOCK CERTIFICATES, STOCK TRANSFER JOURNALS, STOCK LEDGERS, ASSESSMENT RECEIPTS,

And all other Blanks, Blank Books, etc., required by Mining and other Corporations, kept on hand or printed to order on short notice, at moderate prices, at the office of the Mining and Scientific Press.

INSECTS.—How gorgeously many insects are dressed. All the splendors of the rainbow are theirs. Solomon, in his search for wisdom studied them with much care, and is said to have written a book about them, which, however, is lost. He said kings in all their glory failed to outshine them! They have gold, silver, copper, iron and brass for coats of mail. Diamonds form their eyes! Some insects look through a thousand diamonds. Many can see further than animals; they can also look in many directions at the same time, and see many diverse objects at once; so as to command a ready view of their enemies, or seek with greater facility for fruits, flowers or food. Their flight almost exceeds belief. It is said that a house fly can make sixty miles an hour, and sustain that speed for a great length of time.

Who has not seen that familiar insect disporting himself in the vacancy of a quiet room. See it as it darts with a rapidity which the eye fails to follow. How rapid and eccentric are its motions. What a power of muscle must it possess, to continue its little wings in such rapid and long continued motion. The libellula, at a speed of forty miles an hour, can stop its flight and turn in a space of less than six inches! The honey bee is supposed to see its objects at a distance of several miles—while its velocity cannot be less than forty miles per hour. No mathematician can draw a right line more direct than the "bee line" this insect makes when he seeks his home. The muscular force of the flea has been often spoken of. Insects, if made as large as men, would soon become masters of the world.

AN INGENIOUS FIRE ALARM.—The French journals describe a new apparatus for this purpose, which is the invention of Houdin, the ex-necromancer. A metallic blade, copper on one side and steel on the other, made of two laminæ, soldered together by their surfaces, is fastened upright to a board. It is connected with one of the poles of a voltaic battery, and also with an alarm bell. A metallic knob, fastened to the board on the steel side of the blade, is connected with the other pole. Now whenever the blade is warned by any means, it bends towards the knob, owing to the greater expansiveness of the copper. If the heat be sufficient, it touches it. The circuit is thereby made complete, and the bell commences to ring, which it keeps up until the contact is interrupted. The sensitiveness of the apparatus may be diminished at pleasure by increasing the distance of the knob from the blade.

MINES AND RANCHES.—Mrs. Durfee recently located a ranch in Little York township, Nevada county. All the necessary steps were taken; the land was surveyed and recorded, but the miners combined to resist the claim. The case came up before the Commissioner at the land office in Marysville, and was decided in favor of the miners. This shows that miner's rights will be respected. All they have to do is to be on their guard and ready to prove that the land is worth more as mining than as agricultural land.

A WINDFALL.—Home, the spiritualist, was recently hard up and in great trouble. He was unwilling to sell the valuable presents which he has from time to time received; and his wife's property was in litigation. At this juncture, an old lady, who, although a stranger, had a great admiration for him as a medium, made him a present of some one hundred and twenty thousand dollars.

CURIOS CALCULATION.—If a cannon ball of the size of the earth were fired directly at the sun with the same velocity with which the earth now travels, and the fact telegraphed at the same moment, the inhabitants of the sun, if any they were, would get the news in five minutes. Two months afterwards, they would feel the "hit," and in about fifteen years, they would hear the explosion.

**TELEGRAPHING EXTRAORDINARY.**—On the night of January 31, the telegraphic operators at Chicago and Heart's Content, Newfoundland, a distance of 2,200 miles apart, were put in direct communication, when the following conversation took place:

Chicago to Heart's Content—Hello! shake hands. What is weather there? San Francisco line is down, or would you put him on—Indians at work.

Heart's Content to Chicago—Weather very cold; wind northeast, blowing gale. Cables asking for weather from you. What's your time? Ours is 1:25 A. M.

Chicago—You come well—cold here, no snow. Ours is 1:15 P. M.

Heart's Content—Valencia says: "Fine and frosty—time 5 A. M. The Anglo-American Company's staff grasp your hand." Also our staff—London fellows have gone to bed. Good morning.

Chicago—Wish I could go. Chicago and the West send greeting. Good morning.

**NOTE.**—When it was 1:25 in Heart's Content and 11:15 in Chicago, it was 11:60 in Buffalo.

Verily, the world moves!

**HONORABLE TRIBUTE.**—At the last annual meeting of the French Academy of Sciences, the Secretary, in his report of works thought worthy of prizes, made a very touching eulogy on the life and character of Lincoln, and announced that a prize would be offered for the best poem on the death of Abraham Lincoln, which should be presented during the coming year. The decision will be rendered in August next. This is the most celebrated institution of learning in the world. Even the Emperor himself, when he attends its sessions, must take a back seat, as he is as yet an unsuccessful candidate for membership.

**MELLVILLE C. KEITH, M. D.**

Homeopathic Physician,

**Job Printing Press for Sale—\$250.**

A Largest Size (half medium) RUGGLES' BEST JOB PRESS, in fine order and good as new, can be had for \$250, cash—lowest price. Warranted. Apply to DEWEY & CO., Mining and Scientific Press Office.

**SAN FRANCISCO**

**UNION BUSINESS COLLEGE**

Merchants' Insurance Building,

108 California Street.

THIS INSTITUTION IS DESIGNED TO PREPARE boys and men for business pursuits, and to impart a thorough commercial education. It is conducted upon actual business principles. The student, upon entering College, is furnished with a capital in cash and merchandise, rents a place of business, opens an account with the bank, insures his goods in the insurance office of the College, and enters upon the arena of business. He commences speculation, carrying out all the details of trade, buying and selling goods, depositing in and checking from the bank, making and negotiating notes, drafts, bills of exchange, etc., recording the transactions and keeping the books in a regular and scientific manner. From this he advances in other capacities, until he finally takes his position in the Union College Bank, a regularly established institution, complete in all its appointments, and having a circulation of one million in College currency. This course saves from four to six weeks' time in copying useless manuscripts. There is no vacation, and students can enter upon any business during the year. The public are invited to call and examine the various departments. Sessions day and evening. Address 7v11 JAMES VINSONHALER, Principal.

## Gaston's Screw Grinder and Amalgamator

—IS—  
The Best Yet Invented.

For rapidity and thoroughness of work, the machine above illustrated is unequalled by any. It wastes no appreciable quantity of quicksilver, and is of itself a perfect settler. Fig. 1 represents the pan with part of its side removed, and fig. 2 the screw muller, and its shoes. The letters show the threads of the screw; H, its shoes, and D a low cylinder within which the screw rotates; E, represents open spaces through the base of the cylinder, and F, inclined partitions filling (at those points) the spaces between the cylinder and the shell of the pan. These inclined partitions are to intercept the current of pulp around the pan, as it issues from under the muller, and turn it toward the center again, over the screw. The dies are not shown in the figure—there are eight. Mercury is not ground, nor floured in this pan. The pulp is ground to a slum, with great rapidity; the muller is raised a little and the quicksilver is poured in *en masse*, forming a layer upon the bottom of the pan. The revolution of the screw then forces the pulp down into contact with the quicksilver, into which it is *effectually rubbed* by the shoes, while the screw, being constantly fed by the pulp from above it, presses all under the muller outward—still in contact with the quicksilver, through the spaces, E, and thence over toward the center of the pan, when it is again seized by the screw and forced down into the quicksilver, rubbed into and forced off in contact with it, which process is continued as long as desired. The pulp can thus be forced into contact with the mercury at the rate of 1,000 pounds in three minutes, or twenty times per hour, and none can escape contact with the mercury, that contact being under the immense pressure of the perpetual screw, in addition to that of gravity, which (gravity) is the only available force in the other pans for bringing the pulp into contact with the quicksilver. "A word to the wise is sufficient." The Screw Amalgamator is the cheapest and most efficient pan manufactured. Millmen! call and see one running at the Pacific Foundry. For particulars, address the inventor, H. A. GASTON, at Cosmopolitan Hotel, San Francisco; or R. L. THOMAS, Esq., Virginia City, Nevada. 1v14qr

**HAYWARD, COLEMAN & CO.,**

IMPORTERS AND REFINERS

## Portable Steam Engines!

"Hoadley's" and "Hittinger's" Make,

**HOADLEY'S.**

**FOUR SIZES,**

**8, 10, 12, and 15-Horse Power,**

**HOADLEY'S.**

**3 to 40-Horse Power.**

**HITTINGER'S.**

**THREE SIZES,**

**5, 7, and 10-Horse Power**

**HITTINGER'S.**

**TWO SIZES,**

**5 and 7-Horse Power,**

**COMBINING THE MAXIMUM OF EFFICIENCY, DURABILITY, and Economy, with the Minimum of weight and price.** These Engines are favorably known, a large number being in use on this coast for hoisting, pumping, threshing, milling and mining purposes. Steam can be got up on these Engines in fifteen minutes after reaching the place of operation, and the time, expense of setting boilers, machinery, and "construction account" saved, (which is often the difference between the successful and unsuccessful prosecution of mining enterprises,) in fact, the portable principle is the pioneer's friend, and enables him to draw engines on their own wheels to his cabin door, and plant on the outermost confines of civilization the saw and grist mill, and it has done and will do more to help subdue the continent than any other of the modern motors which are crowding society and normalizing the world.

All sizes on hand from 3 to 20 horse power, with an without carriages.

Also, Portable Saw and Grist Mills. For sale by **TREADWELL & CO.,** Corner of Front Market and streets. 9v14 6m15p

### Rates of Postage on Printed Matter to Europe and Asia.

The Post Office Department has made arrangements by which a number of European and Asiatic countries, hitherto beyond the reach of our mail communication except by letter, are brought within the range of delivery of all, or nearly all, United States mail matter. It is a singular fact, unknown probably to most persons who have not occasion to learn it by unpleasant experience, that there was a considerable region in the civilized world where an American traveler might not receive a newspaper directly from home.

Under the arrangement now completed, prepayment of postage (sometimes at high rates), is made necessary in all cases. The following official statement gives a full list of the countries—with some of which there has been regular communication—that are now included in the delivery by way of Hamburg and Bremen:

Rates of postage on newspapers and other printed matter (periodicals, etc.) sent from the United States to countries in Europe and Asia, by Bremen or Hamburg mail—prepayment compulsory:

#### NEWSPAPERS—MARKED AS FOLLOWS:

Bremen, by Bremen mail—2 cents each.  
Hamburg, by Hamburg mail—2 cents each.  
Prussia, Austria and German States, by Bremen and Hamburg mail—3 cents each.  
Lunenbourg, by Bremen mail—3 cents each and 1 cent per 1½ ounce.  
Schleswig-Holstein and Denmark, by Bremen or Hamburg mail—3 cents each and 1 cent per 1½ ounce.  
Sweden, by Bremen or Hamburg—3 cents each, and 1½ cent per 1½ ounce.  
Norway, by Bremen or Hamburg—3 cents each, and 3½ cents per 1½ ounce.  
Holland, by Bremen or Hamburg—3 cents each, and 1 cent per 1½ ounce.  
Russia, by Bremen or Hamburg—3 cents each, and 1 cent per 1½ ounce.  
Switzerland, by Bremen or Hamburg—4 cents each.  
Italy, by Bremen or Hamburg—5 cents each.  
Turkey, by Bremen or Hamburg—3 cents each, and 5½ cents per 1½ ounce.  
Greece, by Bremen or Hamburg—3 cents each, and 5½ cents per 1½ ounce.  
Gibraltar, Spain and Portugal, by Bremen or Hamburg—3 cents each, and 2½ cents per 1½ ounce.  
Austria, India and China, by Bremen or Hamburg mail via Marseilles—3 cents each, and 9 cents per 1½ ounce.  
Austria, India and China, by Bremen and Hamburg mails, via Trieste—8 cents each, and 2 cents per 1½ ounce.

#### PERIODICALS, ETC.

Bremen, by Bremen mail—1 cent per ounce.  
Hamburg, by Hamburg mail—1 cent per ounce.  
Prussia, Austria and German States, by Bremen or Hamburg—1½ cent per ounce.  
Lunenbourg, by Bremen mail—1½ cent per ounce.  
Lunenbourg, by Hamburg mail—1½ cent per ounce, and 1½ cent per 1½ ounce.  
Schleswig-Holstein and Denmark, by Bremen or Hamburg—1½ cent per ounce and 1½ cent per 1½ ounce.  
Sweden, by Bremen or Hamburg—1½ cent per ounce, and 4 cents per 1½ ounce.  
Holland, by Bremen or Hamburg—1½ cent per ounce, and 1½ cent per 1½ ounce.  
Russia, by Bremen or Hamburg—1½ cent per ounce, and 1½ cent per 1½ ounce.  
Switzerland, by Bremen or Hamburg—1½ cent per ounce, and 1 cent per 1½ ounce.  
Italy, by Bremen or Hamburg—1½ cent per ounce, and 2 cents per 1½ ounce.  
Turkey, by Bremen or Hamburg—1½ cent per ounce, and 5½ cents per 1½ ounce.  
Greece, by Bremen or Hamburg—1½ cent per ounce, and 5½ cents per 1½ ounce.  
Gibraltar, Spain and Portugal, by Bremen or Hamburg—1½ cent per ounce, and 2½ cents per 1½ ounce.  
Austria, India and China, by Bremen or Hamburg mail, by way of Marseilles—1½ cent per ounce, and 9 cents per 1½ ounce.  
Austria, India and China, by Bremen or Hamburg mail, by way of Trieste—6½ cents per ounce, and 2 cents per 1½ ounce.

These charges are in each case in full to destination, combining rates between the United States and Bremen or Hamburg, and the rate beyond Bremen or Hamburg to points of delivery.

OLNEY & Co., Auctioneers and Real Estate Agents, attend promptly to all business entrusted to their care in San Francisco and Oakland. Mining and other corporations will find Col. Olney well posted and thorough in transacting sales of delinquent stock. Office, on Broadway, Oakland, and No. 318 Montgomery street, San Francisco. nolo

NATURAL CHRISTMASIES FOR CHRISTMAS.—At No. 522 Pine street, E. F. LORQUIN, the Naturalist, has on hand a beautiful assortment of glass globes full of Stuffed Birds, Shell, and Wax Flowers, besides Feathers, Birds and Butterflies, for ladies' hats, Shells, Sea-weeds, etc. 24v13-qr

### Perry Davis' Vegetable Pain Killer.

The Great Family Medicine of the Age! Pain Killer, taken internally, should be adulterated with milk and water, and sweetened with sugar if desired, or made into a syrup with molasses. For a Cough, a few drops on sugar eaten will be more effective than anything else. For Sore Throat, gargle the throat with a mixture of Pain Killer and water, and relief is immediate and the cure positive.

It should not be forgotten that the Pain Killer is equally as good to take internally, as to use externally. Each bottle is wrapped with full directions for its use.

Please read the printed directions.

Sold by all Medicine Dealers everywhere. 9v14-1m

### Allen's Lung Balsam

Is warranted to break up the most troublesome Cough in an incredibly short time. There is no remedy that can show more evidence of its merits, than this Balsam, for curing Consumption, Coughs, Colds, Asthma, Croup, etc.

To Physicians—Physicians having consumptive patients, and having failed to cure them by their own prescriptions, if they desire to try Allen's Lung Balsam, by writing to the proprietors they will send a formula which will enable them to judge whether the ingredients are of a superior compound or not. The medicinal properties are extracted by a chemical process. The apparatus by which some of them are extracted cost many thousands of dollars.

Dr. H. F. NASH, Dentist, Office No. 132 West Sixth Street, Cincinnati, states as follows: Gents—About one year ago I took a cold which settled on my lungs. A violent cough was the consequence, which increased with severity. I expectorated large quantities of phlegm and matter. During the last winter I became so much reduced that I was confined to my bed. The disease was attended with cold chills and night sweats. A diarrhoea set in. My friends expected me to give it a trial, and I was told that my cough is entirely cured, and I am now able to attend to my business as usual. P. MEREDITH.

Sold by all Medicine Dealers everywhere. 9v14-1m

Seen a journal has been needed on the Pacific Coast. The Press fills the bill.—Rose River Recreant.

## HEPBURN & PETERSON'S PANS AND SEPARATORS,

For Reducing and Amalgamating Gold and Silver Ores.

We invite the Mining Public to examine the record of our Machines before adopting any other for producing similar results. They have been in general use for the past three years, during which time they have been repeatedly tried in comparison with every other machine of note, and of a similar nature, and have invariably been adopted in preference; which facts we offer as the most suitable recommendation, and which is attested by the following list of

**ORE CONCENTRATORS.**—This class of machinery seems to be attracting more than usual attention. Mr. Belden, Superintendent of the Empire mill, at Grass Valley, after running Hendy's new concentrator ten days, has reported quite favorably of its operations. The proprietors of the Coney mill, Amador county, who have had a good deal of experience with Hendy's old machines, as well as with other concentrators, have just ordered another of Mr. Hendy's patent. The Pacific Foundry has this week shipped two of these machines for the Noyes mill, near Prescott, Arizona. Mr. Hendy has also further orders for two machines for the southern mines. It is claimed for these machines that they entirely do away with any necessity for sizing the particles of the ore before concentrating—an operation advocated by some parties.

**SUTRO TUNNEL COMPANY.**—The Trustees of the Savage company passed a resolution on the 7th instant, authorizing the President to subscribe \$150,000 to the stock of the company, subject to ratification by the stockholders at their next meeting. The subscriptions now stand thus: Empire company, \$15,000; Hale & Norcross, \$100,000; Gould & Curry, \$100,000; Savage, \$150,000; making a total of \$365,000. Eastern capitalists will soon see that those who are to be especially affected by the work are willing to venture money upon it.

## Warner's Flour Packing and Weighing Machine.

We give annexed an illustration of a new invention by Mr. G. A. Warner, of Portland, Oregon, designed for filling hags with flour or any fine material, and weighing it into equal quantities at the same time. The operation of the machine may be described as follows:

The hag or sack into which the flour is to be packed, is first placed around the lower part of the drain or cylinder, A, and secured in place by hooks, when a gate at the bottom of the hopper, E, located at L, is opened and held thus by a spring, not shown, while the flour is conveyed by a spiral conveyor or packer, into the sack at the bottom of the cylinder. This packer is worked horizontally within the cylinder, A, by the bevel gear, C, operated by a hand crank on the shaft, b; or power may be attached to the

pulley on the opposite extremity of the shaft. The flour, or other material to be packed, is fed in any proper manner, from a convenient receptacle through the hopper, F. By the action of the spiral packer, the material is compressed, as fast as delivered into the sack to any reasonable degree of closeness.

The platform on which the sack is seen to rest is elevated by the pulley and weight, D, at the commencement of the operation, to near the bottom of the cylinder, A; the sack at the same time being brought up around and upon the outside of the cylinder. By this arrangement, the filling and packing commences in the bottom of the sack, and progresses gradually; the sack, with the platform on which it rests, dropping as fast as the filling goes on. This is so arranged by weights and springs, that when any desired amount of material has been placed in the sack, an automatic action closes the gate at the bottom of the hopper, and prevents the ingress of any more material. The machine can be adjusted to any desired amount from twenty-five pounds upwards, to 200 or

more; the whole process of filling, packing, weighing and cutting off at the proper moment, being automatic in action, by the attendant merely turning the crank or shaft, b, or applying power to the pulley upon the same. The only attendance required is to place and secure the sack on the cylinder, as seen in the engraving, and to remove the same after being filled.

The invention appears to be a very useful and practical one. It is applicable to small grain, such as wheat, etc., as well as to flour and other pulverized material. It is extremely simple, light and does not appear to be particularly liable to get out of order. A working model of this machine may be seen in operation at the New England House, 205 Sansome street. As the inventor is about to proceed to the East in search for a larger field in which to operate than is presented on this coast, he will sell the right for California, Arizona and Nevada, either separate or together. For further particulars, address G. A. Warner, San Francisco.

## Iron Shipbuilding in San Francisco.

During the past week our attention has been called to something quite new in the mechanical enterprise of San Francisco. Mr. D. Cameron, proprietor of the Neptune Iron Works, corner of Mission and Fremont streets, has recently taken a contract for building three iron steamers of about 150 tons each. These steamers will be stern-wheel boats, driven by double engines of 75-horse power. Their dimensions will be seventy-five feet in length, sixteen feet in breadth of beam, and five feet depth of hold. They are being constructed of three-sixteenths iron, with 3-inch angle iron for their frames. The decks will be made of wood. The first of these boats is in a forward state of completion, and may be seen at Cameron's yard, on Fremont street, nearly opposite the Neptune Iron Works building. They are being constructed for the "Lake Chapala and Rio Grand Steam Navigation and Commercial Company," which has been organized to navigate Lake Chapala and the Rio Grande river.

The immediate purpose of the company is to put upon that lake the three steamers already contracted for, which will be used for towing barges from point to point on the lake and river, for a distance of about 100 miles. There is a large amount of transportation between Gaudalajara, some forty miles to the northwest of the lake, and the eastern shores of the same, about one hundred miles distant. The custom-house books of Gaudalajara show a through transportation of nearly 1,000 tons weekly, in addition to such goods as do not have to be entered, to say nothing of passengers. The present facilities for transportation there are of the rudest kind, and totally inadequate to the business offering.

The boats will be temporarily set up in this city, then taken apart and transported with their engines to the lake, where they will again be put up, the engines placed in position, the wood-work completed, and the boats delivered over to the company after a successful trial trip. The boats will connect with forty-ones miles of railroad from the lake to the city of Gaudalajara. Mr. Cameron has had considerable experience in

this branch of business in Scotland; having built several iron steamers on the Clyde, before coming to this city, with which place he has now permanently identified his fortune. Mr. C. is also building two sawmills for the same locality.

These orders are indicative of an important class of business, which the pacification of Mexico will open up to the advantage of this city. San Francisco, as we have often said, must become the great machine-shop of the entire Pacific coast of North America. Our facilities will soon be such as will effectually preclude the possibility of our being underbid by Eastern mechanics in any branch of business whatever, from making a hob-nail to constructing an iron steamship. The rolling mills on the Potrero will greatly add to our facilities in this direction. It will soon become absolutely necessary that we should not only roll our own iron, but produce it, too, from the mine. There is no reason why we should be indebted to the East for either the raw material or the manufactured article. The first rolling mill in San Francisco, and the first iron furnace in Oregon, will soon be in operation.

Iron boats, of the description of those being built by Mr. Cameron, would probably be found to answer better than wooden ones for the shallow streams of this State, such as the Feather, the upper Sacramento, and the Colorado rivers. These boats draw but eight inches of water, with their machinery on board, when light. The weight of the hull is about forty-five tons. After Mr. Cameron has fully demonstrated that such boats can be as readily built in this city as wooden ones, no doubt more attention will be directed to the superiority of iron over wood for ship-building, both for sailers and steamers.

**NEW TELEGRAPH COMPANY.**—The certificate of incorporation of the San Juan and San Bernardino Telegraph Company was filed in the County Court on March 6th. The company propose to erect a telegraph line from San Jose to San Bernardino via San Juan South, Paso Robles, Hot Springs, Santa Marguerita, San Luis Obispo, La Patera, Santa Barbara, San Buenaventura, Los Angeles, El Monte and San Bernardino, under a franchise granted to Benjamin Flint and J. S. Bigbee, by an act of the Legislature, passed at the last session. Capital stock, \$150,000, divided into 300 shares of \$500 each. Stockholders: W. E. Lovett, San Francisco; Austin Wiley, San Francisco; P. W. Murphy, Santa Marguerita; Thomas Flint, San Juan, and Walter Van Dyke, San Francisco.

**GEOLOGICAL SURVEY.**—A New York telegram, dated March 6th, says: Gen. Grant and the Secretaries of War and of the Treasury, are said to be much interested in the proposed geological survey between the Rocky Mountains and the Sierra Nevada. The expedition will be accompanied by an efficient military escort. The appropriation comes out of the War Department Fund. Mr. King will be chief of the geological party.

[Written for the Mining and Scientific Press.]

## What is a Practical Chemist?

BY E. PIQUE.

[Continued from Page 130.]

The disadvantages of the blast furnace are as follows:

*First*—We cannot treat in it pulverized substances, as they interfere with the action of the blast on the fuel. In some cases the pulverized substance has been formed into bricks or lumps, by mixing it with clay, moistening and drying it; but this is an additional labor, increases the bulk, and makes the mass more difficult of fusion.

*Second*—Some metals, when exposed to a strong blast and great heat, will be volatilized and consequently lost, since condensers could not conveniently be connected with the same. I know a company that put up blast furnaces in the mines for the purpose of extracting the gold from gold-bearing pyrites. They used large quantities of lead for collecting the gold; but after the operation was finished, the smelted mass contained neither gold nor lead, as both these metals had been evaporated and carried off by the blast.

*Third*—We have not so much control over the substance we are smelting, in a blast furnace as we have in a reverberatory furnace; since, in the latter, we can stir the mass when it is required, and we can occasionally add some other ingredients; or, when the hearth is slanting, we can introduce the mixture in small quantities, and watch the progress of the operation.

*Fourth*—It takes some kind of mechanical contrivance and a moving power to produce the blast; but this objection is of no consequence where steam power for other purposes is at hand. It is not my object to write a treatise on furnaces, but to point out some of the differences between working on a large or small scale. Another principal point is, that in small operations the object generally is to obtain a certain result, and as the quantities are small, we often use chemically pure materials, and we are regardless even of quantities, since the expense cannot amount to much—whether we take a trifle more or less. It is quite a different thing in working with large quantities, where the scientific object is not the only result, but *pecuniary gain*. We would, for instance, not hesitate to smelt half an ounce of a mineral with four times its weight of litharge, soda or other flux, to obtain a complete liquefaction; but we most assuredly would object to use the same proportions on a large scale, and it would appear ridiculous to smelt one ton of ore with four tons of litharge. Just as a man would appear not to be in his right mind, who would use chemically pure acids for dissolving metals by the ton, although for analysis and other small operations, they are necessary articles.

When, in my younger years, I studied chemistry, I made a beautiful green precipitate by mixing the solution of arsenic with a solution of crystallized acetate of copper. But, being afterwards engaged to superintend some chemical works, and having occasion to manufacture the above article on a large scale, I certainly did not dare to use such an expensive article as the crystallized acetate of copper, but was obliged to use the common verdigris that was made in France, in the shape of cannon balls, and which, being much cheaper, at the same time gives a much larger yield than the crystallized article; but I must say I experienced in the beginning considerable difficulty in using it, until I overcame the same by practical experience. Another instance is the different kinds of logwood, which is used in dyeing cotton, silk and other fabrics. These differ very much in price, and an experienced dyer will be able to produce the very best result with a common and cheap kind of logwood, while an unpractical man will be obliged to use the most expensive material.

Since the principal object of all operations, on a large scale, is to *make money*, I would call a practical chemist—one who, in some particular branch, is able to *produce the very best result at the smallest expense*. To do this, he must be able to work with the smallest quantity and the cheapest kind of material that will answer the purpose. For the same reason he must use the most appropriate tools, vessels, furnaces, etc., so as to save labor, fuel, and in fact to work with the greatest economy and dispatch. For instance, common sense will teach us that if anything has to be discharged, the discharging vessel ought to stand higher than the receiving vessel, as a fluid or semi-fluid mass will naturally run down by itself without any assistance, while if that arrangement is not observed, we are obliged to pump the fluid up, which is an additional labor and expense. On this principle, in working silver ores, the stamps for crushing stand generally on an elevated place, so that the ground ore will run by itself into the pans, and from thence, after being amalgamated and diluted with water, will run into boxes or vats, which occupy a still lower place, etc. Or, if the ore is ground dry, it will be conveyed to the tops of the roasting furnaces, will discharge itself, and after being roasted, fall to a still lower place for being sifted, etc. All these things appear trifling and childish, but still without them we cannot succeed.

In concluding my remarks, I will only say, that not only large operations require practical experience, but everything, even the smallest operation, requires practice, which we cannot learn from books, but only by actual working, since a good many things appear too insignificant to be found in any theoretical work. I think no one will dispute that the many small operations of analytical, or even synthetical chemistry, require not only a thorough knowledge of the laws of nature, but a proper management of the tools and vessels, and a practical manipulation of the substances. How many times have I destroyed my vessels, and lost the result of my labor by want of experience! Of the many things that annoyed me, I will mention only a few.

Once, I intended to make persulphuret of soda; I took a heater glass, put pulverized sulphur in it, then poured in a solution of caustic soda, and applied the heat of a spirit lamp. The result was that the glass cracked, and the contents ran out upon the table. I tried another glass with no better result, until it occurred to me to put the solution of caustic soda in first, and the pulverized hrimstone on the top of that. After that I never broke any more glasses, and I could boil it as long as I chose.

Another time I wished to produce carbonic acid gas by fermentation, and to saturate an alkaline solution with the same. I put sugar, water and yeast into a bottle with a perforated cork, and conducted the gas through a bent glass pipe into another glass, containing the alkaline solution. I placed the apparatus on the window-sill, and left it there. When I returned, after some time, I found my whole apparatus smashed to pieces, as also were all the panes in my window glass. The glass had an outlet, but not sufficient. I repeated the experiment with a wider glass pipe, and succeeded.

Once I attempted to make chloride of calcium. I put hurned lime into concentrated muriatic acid; but I was very much astonished when I found that the lime would by no means dissolve in the muriatic acid. I slacked the lime first with water, and then it readily dissolved in the acid. It seems that hurned lime has no more inclination to combine with an acid than the anhydrous sulphuric acid has to combine with a base.

In a great many cases we have to combine two substances, both of them soluble in water, whose solutions, when mixed, form an insoluble precipitate. Now, in working small or large quantities, we ought invariably to dissolve each substance separately, and then mix the solutions. Sometimes, to save time, I put both solid bodies together, and poured water over them. But I did not save time by that, as one substance impeded the dissolving of the other, it took much longer time, the operation was generally imperfect, and the precipitate ugly. In many cases it makes a great difference which of the two solutions we pour in first—whether we pour A into B, or B into A. A most important point, no matter whether we work by the ounce or by the ton, is to know whether it is necessary to use the precise equivalent of either solution, or whether it is better to take a surplus of one or the other. Now, if we deal with precious substances, we have to be very careful in most cases not to take the least excess either of one or the other solution, which we can only accomplish by repeated testing; as, for instance, in precipitating a solution of nitrate of silver with common salt, we must take

just enough of the latter to precipitate all the silver, but not the least excess, as a part of the already formed precipitate would be dissolved again. The same will be the case if we precipitate chloride of gold with cyanide of potash, etc. In other cases, particularly if we work with cheap material, it is very desirable to take a small excess of one of the two substances, since it is tedious to ascertain the precise equivalent, and as it is very often the case that a surplus of one solution would injure the precipitate in some way, we consequently are quite safe in taking an excess of the other.

I once had a very narrow escape from serious personal injury, when I tried to light hydrogen gas, which I produced by treating zinc with diluted sulphuric acid in a bottle; and although I allowed the gas only to escape through a very fine orifice, still it resulted in a tremendous explosion, breaking everything to atoms, most likely because I did not wait long enough to give the enclosed atmospheric air time to escape. Repeatedly I destroyed my crucibles, until I found out some of the different causes of it. Sometimes the contents were of such a kind as to liberate a large quantity of gases when exposed to red heat, and as I stamped the contents very firmly into the crucible, the gases not finding an outlet, the crucible was broken in a good many places. The very same operation would succeed very well by putting the mixture loosely into the crucible, without forcing it in. Almost every one knows that it is well to heat the crucible gradually. I found, also, that if I used wood for kindling the charcoal, and put the crucible in the fire before the blazing flame of the wood had subsided, it would very often crack the crucible, as many crucibles will endure the greatest heat that charcoal can produce, but cannot stand the blaze of the kindling wood, because this produces an uneven heat in the different parts.

I could thus keep on writing hundreds of pages about trifling things. It is the knowledge of these trifles which distinguishes the practical man from the mere book-man; they are all founded on some reason or other, and without observing them we destroy our tools, waste our material, and consequently do not get the desired result; even sometimes endanger our lives.

But to return to my first statement, I will only ask whether there is any sense in calling a man a practical chemist merely because he has worked with large quantities? In the mines we find a class of men calling themselves chemists that know just enough to put ground silver ore in iron pans, mix it with salt, and a little blue, green or white vitriol, quicksilver and hot water, afterwards time to discharge it, and to get their amalgam. But I should imagine that to deserve the name of a *practical chemist*, a man ought to be a thorough chemist. Any man might learn to perform one operation of some kind, and even might perform the same tolerably well; but unless he has studied chemistry from the foundation, he cannot remedy any defects in the operation, because he does not know where the fault lies, neither does he know the remedy. For instance, if an ignorant man, in extracting gold or silver, loses one-half of the precious metals, he must be satisfied, since he does not know how to change the operation so as to get the other half. If any change in the ore occurs, he is lost forever, because he has only learned how to do one thing, and this one thing he expects to answer for everything, just like a patent medicine that will cure any kind of disease, no matter what it is.

**WESTERN UNION TELEGRAPH.**—A New York telegram, dated February 28th says: "A letter from the directors of the Western Union Telegraph Company says they resolved at a recent meeting to send a Commissioner to Russia to urge that Government to assume the construction of the Russo-American telegraph from the Amoor to the Russian possessions. If Russia refuses, it is probable that the line will be abandoned. The Atlantic Cable proving a success beyond the expectations of those who constructed it, but not being fully employed, which causes a reduction of its rates—is assigned as the reason for the abandonment of the enterprise. It is stated that the company have expended two and a half millions of dollars, and has property and funds worth one million and a half."

**SMALL DEFECTS IN IRON CASTINGS** may be filled with a composition made by fusing together nine parts of lead with two of antimony and one of hismuth. This metal expands in cooling, and will keep its place.

**QUARTZ MILLS** in Vermont, to the number of from four to six, will be put up during the coming season.

## How Long will a Snail Live Without Food.

[Read before the California Academy of Natural Sciences, March 4, 1886, by R. E. C. STEARNS.]

In my remarks upon the *genus Helix*, made before the Academy last August, I made no reference to the annual period of inactivity, torpor or sleep, peculiar to the snails and other tribes of the *Gophila*, and which is called hibernation or estivation, according to its occurrence either in winter or summer. Some conchologists use these words synonymously, as will be seen erroneously, at least in some cases, from the fact that in countries where the winters are cold, and accompanied with snow and ice, the sleep of the snail is properly hibernation. Where the summers are hot, dry or rainless, as in the greater portion of the Pacific States and in South America—for instance in the Atacama desert—the period of sleep is in the season of summer. In the Philippine Islands, where the climate is perhaps the most favorable for the snail, this period of hibernation or estivation is very short, even if it exists at all. Hardly a day passes without a shower or showers; the snails are numerous, both in species and individual, and attain a large size. The shells of many of the species are high-colored, and of the texture of French porcelain. In these islands, at all seasons of the year, they may be seen crawling up the trunks of the palms and other trees, or feeding upon the luxuriant vegetation of this tropical climate.

It is true, that in isolated instances, this period of torpor extends to an abnormal length, embracing both winter and summer; continuing for years, with, perhaps, limited intervals of inactivity, proving the remarkable vitality of these comparatively insignificant animals, and their ability to exist for great lengths of time without food.

In that invaluable work to the conchological student, entitled "Recent and Fossil Shells, by S. P. Woodward, pages eighteen and nineteen," several instances are cited of the duration of this sleep, and of resuscitation after long fasting and imprisonment—in some cases continuing from one and one-half to two and one-half years.

Particular mention is made of a specimen of the snail *Helix desertorum*, which was affixed to a tablet in the British Museum, March 25th, 1864, and upon the 7th of March, 1850, it was observed that the animal must have come out of the shell, as the paper was discolored in the attempt to get away, but finding escape impossible, it had withdrawn inside of the shell and closed the aperture with the usual glistening film, which led to its immersion in tepid water and marvellous recovery. It will be noticed that this period embraced nearly four years.

A more remarkable case has come under my observation, which is worthy of mention.

Dr. Veatch, a member of this Academy, visited Cerros or Cedros Island, opposite the coast of Lower California, and upon his return, in the year 1859, brought home, among other shells, a species of *Helix*, supposed to be new, described by Dr. Newcomb, of Oakland, and to which the latter gave the name of *Helix Veatchii*; many specimens of this species were obtained, and some of them were given by Dr. Veatch to the late Thomas Bridges. Mr. Bridges died in September, 1865, and in December of the same year a portion of his collection passed into my hands, including the same species of *Helix Veatchii* to which I have before alluded. Judge of my surprise, when one day, upon a careful examination, I detected a living specimen, which after being placed in a box of moist earth, in a short time commenced crawling about apparently as well as ever; and fearing from its activity that by some accident it might crawl away, and I might thus lose it, after a fortnight's furlough from its long imprisonment, I placed it in a pill-box, marking the date of its imprisonment upon the cover, in order that at some future time I may examine it, and ascertain possibly, if it does not outlive me, how long a snail can live without rations.

Here is an instance of a snail living at least six years—in California parlance, without a single square meal; and it is probably still alive, though sleeping, and perhaps dreaming of Cerros Island and the snails it left behind.

The river St. Lawrence is to be dammed at Lachine Rapids, in order to obtain hydraulic power. The capital of the company, which proposes doing it, is \$2,000,000.

## Mechanical.

## Cheapening the Product of Iron.

The enormous and steady increase in the demand for iron, renders every improvement in its manufacture of immense value. Not the least important item in cheapening the production of iron in England, within the past few years, has been the improvements in the construction of blast furnaces. Twelve years ago it was thought impossible to work a furnace over fifty or fifty-five feet high; while the utmost limit allowed the "boshes" (the place of greatest diameter in the furnace) was not over fourteen or eighteen feet in diameter. With furnaces of such a description nearly all the gas generated in the combustion of the fuel either passed off as smoke, or was burned at the top of the chimney, throwing up huge volumes of flame, which lighted up the country for miles around.

Furnaces are now constructed from 85 to 102 feet high, and with boshes from 22 to 27 feet in diameter. The great advantage of this increase in height and diameter, is found in the more perfect economizing of heat. With a furnace only 45 or 50 feet in height, a large portion of the heat passed out in a continuous stream of hot air and gas; while this air is now carried up to double that height, passing all the way through the mass of "material"—the technical term for the coke, lime and ore employed in producing the iron. During this passage the air and gas imparts nearly all its heat to the mass, and leaves the furnace at a temperature but little in excess of summer heat.

The fear heretofore has been that the superincumbent mass of material would so crush the coke at the bottom of the furnace as to render it unfit for fuel. The result is, what in fact might reasonably have been expected, that there is no more pressure upon the hearth of a furnace 100 feet high, than there is upon one only 50 feet in height. The philosophy of this may be readily explained by gradually filling a small glass tube with sand, and watching the process. The particles of sand will be seen to arrange themselves in the form of a series of cones, one over the other, sloping from the central apex in every direction to the sides, at an angle of about 45 degrees. If a tube three-quarters of an inch in diameter, be thus filled to the depth of five or six inches, and then laid down upon its side, and a stick thrust in to push the sand through, the effort will be unavailing. The peculiar arrangement of the sand, as above described, causes a lateral pressure, so that the walls of the tube hold the weight of the sand, or resist the pressure applied by the stick.

So it is in the cupola furnace, when the filling in of the material is carried to any considerable height above the point where the mass becomes plastic, the entire weight of the hard mass in the upper portion rests upon the walls of the furnace, and not upon the hearth. If the full weight came upon the molten mass, the incandescent coke would be crushed and the furnace become choked, or, as the furnace-men call it, "gobbed." We presume that in constructing these extra high furnaces, the upper portion is built with nearly perpendicular walls; or at least with less inclination than is usually given to the walls above the boshes, in the low furnaces. It would be necessary to give them some outward inclination, in order for the mass to settle at all.

**ENGRAVING BY MACHINERY.**—The American *Artisan* acknowledges the receipt of a specimen of machine engraving done by J. C. Guevant and R. J. Field, of Lakesville, N. C. They claim that their machine will do all kinds of engraving; that it can engrave the "Declaration of Independence" in a circle of one quarter of an inch diameter, so that it can be read distinctly with a magnifying glass. The machine is adapted to engraving the inside of finger rings and all other surfaces. An illustrated description of this ingenious machine will shortly be published.

**SHAVINGS IN METAL TURNING.**—The shape and length of the shavings made in turning metals are determined partly by the skill of the workman, partly by the quality of the cutting tool, and partly by the nature of the material operated upon. Continuous shavings of great length in steel and iron turnings are proofs of the malleability and uniformity of the metal. In gun factories the continuity of the shaving in turning the barrels is considered a proof of the solidity of the welds. In testing the soundness of railway axles, after they have been in use for a certain length of time, a thin shaving is removed. The smallest crack in the axle, even if not perceptible under the microscope, will cause the shaving to split up longitudinally. A practiced eye will determine the state of the cutting tool from the cuttings taken off by it. If this tool is blunt, the crushing action upon the shaving will be increased, and it will be very short in proportion to the surface from which it was removed. In planing armor plates, the shavings are the best proofs of the malleability of the iron. The London *Engineering* says that at the Atlas Works, in Sheffield, shavings six inches in width are taken off the whole length of a plate in one continuous piece.

**MR. NASMYTH ON "SMALL INVENTIONS."** In the course of his examination for the plaintiff in the recent case of *Bovill vs. Goodier*, Mr. J. Nasmyth made the following observation, on the influence of a small modification on the success of greater inventions. He remarked: "One of the most successful inventions of the day is that in sugar-refining, of the application of the apparatus which used to be applied for drying cloth and getting rid of water from textile fabrics. It was a patent of Mr. Bessemer's for getting rid of the molasses from sugar, by the rapid whirling of this vessel. It was found that the outside of the vessel being covered with wire cloth so as to allow the molasses to escape and yet retain the sugar, the molasses gathered on the outside of the wire-cloth and collected there in a coating. After some of the most ingenious minds had been applied to it, one of the most ingenious men of the day, Mr. Bessemer, saw the whole thing fail on account of the simple difficulty that remained—a difficulty which stood for some years. But another inventive man suggested that by blowing a small stream of steam on the outside of the wire-cloth, it would just so much dilute the treacle as to allow the same to be operated upon by the centrifugal action. That small jet of steam made the invention entirely successful. It was one of those trifling little things that it surprises one it should not have been thought of; but it sometimes requires the study of the most profound philosophers to accomplish these things. It was thus with James Watt's separate condenser."—*American Artisan*.

**ANTI-ATTRITION POWER.**—Under this heading the Patent Plumbago Crucible Company, of Battersea, have recently introduced an impalpable powder, perfectly free from grit, which has the property of cleansing and polishing the machinery to which it is applied. It is found to answer admirably the purpose for which it is intended, and is coming largely into use, we understand, for lubricating the cylinders of blowing engines, and for dusting molds for iron and brass castings, as well as the ingot molds for Bessemer steel. This anti-attrition powder does not heat, and possesses the great advantage of not catching dust, etc., as oil and grease do. It is found that it adheres well to metals, and it is thus particularly applicable to quick-running shafts, as it does not fly off.

**TEMPERING SPRINGS.**—Heat the spring evenly throughout its entire length, in a charcoal or coke fire, to a light-red heat; then plunge it into warm whale or lard oil, and let it remain until cool. Now smear the spring with tallow, and heat it slowly over a brisk coal fire. The tallow melts, then takes fire. While it is burning, move the spring about, so that the blaze will completely envelope it. Repeat this operation, and even a third time if the spring is to be subjected to great strain.

**DIFFERENCE IN METALS.**—An alloy of copper, hard enough for an edged tool, is softened by being heated and plunged into cold water; while iron and steel are hardened by the same treatment.

## Scientific Miscellany.

## Origin of Anthracite—Effect of Thermal Action.

Mr. Daubree was the first experimenter who distinctly pointed out the true origin of anthracite, and proved his theory by actual demonstration. Pressure and heat had previously been considered the chief, if not the only agents in the production of bituminous coal from wood fiber, and anthracite from bituminous coal; but the agency of hot water seems to have been entirely overlooked. In order to show the agency of water in metamorphic action, M. Daubree enclosed various substances in strong iron tubes, filled with water and closed tightly with screw plugs. These tubes were built into the brick work of a gas furnace, where they were constantly exposed for a period of several months.

Subsequent examinations showed that wood, thus exposed, was first reduced to a gelatinous state, in which it lost its longitudinal form, and was compressed into a globular shape. After remaining a while longer, this ball was converted into anthracite coal.

Glass on being subjected to a similar treatment was decomposed, and its silic converted into beautiful crystals of quartz.

Continued observations showed that it was not necessary that the water in these experiments should be superheated; but that the same result would take place in water kept at, or even just below the boiling point; provided sufficient time was allowed for the slower action.

It is well known that the warm springs of Plombiers, in Italy, were used by the ancient Romans for bathing purposes—the waters being conducted into the city through aqueducts built of brick and cement. These thermal waters ran through this aqueduct for a period of about 2,000 years. On its being broken down and examined, the interior surface was found to be transformed into crystalline minerals, similar to those which occur in metamorphic rocks; thus affording a most remarkable demonstration of the action of thermal waters in the metamorphism of mineral matter.

De Lenarmont, by a similar set of experiments subsequent to those of M. Daubree, has produced artificially most of the minerals found in metallic veins, such as quartz, (also produced by Daubree) carbonate of magnesia, zinc, spathic iron, sulphate of baryta, sulphide of antimony, mispickel (arsenical iron pyrites), ruby silver, etc. These illustrations of the metamorphic action of hot water are most interesting and important, especially when taken in connection with the well established fact that nearly or quite the whole surface of the earth has been for ages covered with seething oceans of hot water.

Mr. W. R. Frink, of this city, has recently communicated to the writer, the following interesting fact, obtained by him personally, some ten or twelve years ago, from Dr. Crookshank, of Harrison, Ohio. The Doctor had been in the habit of keeping in his office small quantities of Seneca oil (crude petroleum), which he used as a medicine. One day, about the time of the interview with Mr. Frink, the Doctor, on looking over some old rubbish in his office, found a small vial marked "Seneca oil," which had probably remained in its hiding place, undisturbed for twenty or thirty years. On drawing the cork he found that the substance had become solidified. He then broke the vial, and to his great surprise, held in his hands a cylinder of *anthracite coal*, which answered all the tests of that mineral. The petroleum had been actually converted into anthracite, probably losing its more volatile products, by evaporation through the cork. The position in which it had lain was such as must have enveloped it in a very warm atmosphere the most of the time, during which it had remained in the office.

Mr. J. H. White, of 109 Commercial street, in this city, informs us that Indian arrows are often found sticking up in the asphaltum beds in Tulare Valley, the wood shanks of which have been completely carbonized, so as to break as brittle as a pipe stem, showing all the characteristics of highly carbon-

ized wood. It is very evident that these arrows must have been exposed to the action of the atmosphere for a great length of time. How the metamorphism has been produced, we leave for others to judge; certainly it has not been done through the agency of heat of any greater intensity than that of the varying conditions of the atmosphere in a very uniformly warm climate.

**TO COLOR WOOD FIBER WHILE GROWING.**—It is well known that scientific experiments have lately been in progress in Europe to color the fiber of wood during the progress of its growth. Mr. Hyatt reports the results of an invention, made by himself for this purpose, and at a late meeting of the Royal Agricultural College in London, exhibited sections of wood thus stained with various hues. This is accomplished by the introduction of metallic solutions into the substance of the growing tree, which is carried up by the sap, and forced into the fibers and cells of the stem. So we can make our forests play the part of their own stainers and grainers, and cut down a pine already prepared to imitate expensive walnut or exotic mahogany. There is only one thing left to desire—that, after being thus stained, the wood could be induced to grow in the form of tables, chairs and wardrobes. That attained, we need no longer despair of realizing the much talked of machine into which you put raw cotton at one end, until by-and-by there emerges at the other a calico shirt, hemmed, starched, ironed, with the buttons all on, and neatly marked.

**PHOTOGRAPHY AND EMBALMING.**—Photography has recently been applied in Europe to a purpose of an unusual nature—obtaining the likeness of a person who had been dead for some months, and with such good results, as, with the assistance of the embalmer, they can scarcely be distinguished from a photograph from life. The art of the embalmer, however, seems to have acted the chief part in accomplishing the results. The *Scientific Review* recently called the attention of its readers to the processes by which M. Gorini preserves organic matters from putrefaction, imparting to them the consistency of stone, without altering their appearance, and retaining them in a condition from which he is able to render them flexible at pleasure. The *Review* says that Pietro Martini, the author of a history of Sardinia, who died on the 17th of February, 1866, and whose body has been preserved by M. Gorini's process, was taken out of his coffin on the 17th of June last, and after having been rendered flexible that he might be properly posed, and appropriately clothed, his likeness was taken with the most perfect success, so that it would never be imagined that it was obtained four months after his death.

**SUN SPOTS CAUSED BY PLANETARY INFLUENCE.**—Mr. Warren De La Rue, who has been for some time engaged in closely observing and studying the spots upon the sun, thinks he has discovered an intimate connection between the numbers and activity of those spots, and the positions of the planets Venus and Jupiter. The nearness of Venus and the magnitude of Jupiter, are such that the attraction of those two planets produces a perceptible effect upon the sun's atmosphere, developing the phenomena known as spots upon the sun; the effect being similar to that of the moon upon the earth, as developed in the tides. This observer has noticed that whenever the planets cross the solar equator, the region of the sun, then more directly acted upon by those planets, becomes more active, and the spots increase in number; and, on the contrary, when the planets are farthest away from the equatorial region, then the spots multiply towards the solar poles. In this we have clearly a case of action and reaction, or, as stated by Mr. De La Rue, "solar activity, as shown in the phenomena of sun spots, would not exist but for planetary influence, any more than certain physical phenomena of the planets would be produced without solar influence." A paper is shortly to be published, with particulars of the observations from which these conclusions have been derived.

**THE SPEED OF ELECTRICITY.**—During the operations involved in determining the difference of longitude between the Astronomical Observatory at London and that at Washington, it was ascertained that the time occupied by a single flash of electricity through the Atlantic Cable was only thirty-five one-hundredths of a second.

## Blank Forms.

Persons who wish to avail themselves of the recent Act, will first file, by mail or otherwise, with the Register at the U. S. Land District in which their claims are located, a "Declaratory Statement," in the following form:

## I.—APPLICANT'S DECLARATORY STATEMENT.

WHEREAS, the undersigned, present owners of the mining claim known as....., situated in the.....District, County of....., State of California, petition for a patent for said claim, under the Act of Congress entitled "An Act granting right of way to ditch and canal owners over the public lands, and for other purposes," approved July 26th, 1866; and respectfully represent that they are an association of persons claiming.....feet of said vein or lode of.....[a further description of said claim being set forth in a diagram accompanying this declaration], and have heretofore occupied and improved the same, in accordance with the local custom and rules of the miners in said District, a copy of which rules are heretofore annexed, marked "A," and have expended in actual labor and improvements thereon an amount not less than one thousand dollars, according to Exhibit "B," hereto annexed; that there is no controversy, within the petitioners' knowledge, as to said claim; that they herewith present a diagram of said mining claim, so extended as to conform to the rules of said mining district, and they claim to enter said vein or lode, together with its dips, angles and variations, to any depth, although it may enter the land adjoining.

That upon filing hereof, they intend posting upon the said lode, in a conspicuous place, a notice of the intention to apply for a patent for the same, together with a copy of the diagram herewith presented, and request that the Register of the U. S. Land Office for the.....District do publish the same, according to said Act, in the.....a paper published at.....in the county of.....California, being the paper published nearest the location of said claim.

That the said parties are, by priority of possession, entitled to the use of water, for.....purposes, of.....Creek, in said District, according to the customs or laws of said District and the right of way for the construction of ditches and canals for the purposes aforesaid; and that the same does not injure or damage any settler on the public domain. [This paragraph to be omitted when no special water privileges are claimed.]

The parties hereto, therefore, propose, at the expiration of the ninety days after this publication aforesaid, should there be no adverse claim, to file in this office a plat of survey of said vein or lode, made under the instructions of the Surveyor-General of the United States, for the.....indorsed with his approval, designating the number and description of the location, the value of the labor and improvements, and the character of the vein exposed, together with satisfactory evidence that said diagram and notice have been posted on the claim during said period of ninety days.

And the said parties hereby request, that after furnishing said proof, you will thereafter transmit to the General Land Office said plat, survey and description, that a patent may issue therefor.

The above must also be accompanied by a diagram drawn in accordance with the directions stated in the paragraphs of the foregoing "Instructions from the General Land Office," commencing with "First," "Second," "Third," "Fourth" and "Fifth," and the succeeding paragraph thereto. Beneath, or annexed to the diagram, should be a description and explanation of the same. Also, another copy of the diagram and notice is required to be posted on the claim for ninety days after the order of publication is given by the Register.

## II.—DIAGRAM, DESCRIPTION OF DIAGRAM AND BOUNDARIES, AND NOTICE.

NOTICE.—The undersigned give notice that they intend to apply for a Patent for that portion of the vein or lode set forth in the above diagram, called the.....which belongs to the.....Company, comprising.....feet, adjoining on the.....end the claims of.....and on the.....end the claims of.....situated in the.....District, County of.....California, and now post this notice on a conspicuous part thereof. Dated, on the ground, this.....day of....., 186.....

Witnesses.....

Next comes the Register's order for publication of copy of the notice required to be posted on the claim. (This order the applicants publish at their own expense.)

## III.—REGISTER'S ORDER FOR PUBLICATION—WITH NOTICE.

U. S. LAND OFFICE, }  
.....186.....

WHEREAS, the company known as.....claiming certain mineral veins or lodes, lands,

and.....in Township No.....and Range No.....Meridian, included in the.....District (the bounds and extent of said claims being fully set forth in the notices posted in this office and on the claim itself), has this day filed in the U. S. Land Office for this District, a declaratory statement, with accompanying diagram of the claim, declaring therein the intention of said company to mine for.....and apply for a U. S. Patent for the lode and land claimed;

It is hereby ordered, that the annexed notice be published for ninety days in the.....a newspaper published at.....in the State of California.

Given under my hand, this.....day of.....186.....Register.

After ninety days' posting and publication of the above, the following blank must be signed by at least two credible witnesses, and filed with the Register:

IV.—DEPOSITION THAT NOTICE HAS BEEN POSTED. County of.....ss.

State of....., of said county, being duly sworn, depose and say, that they were present when the foregoing notice and diagram were posted on the.....vein or lode in the.....District, county of.....California; that the same were posted in a conspicuous place on said vein or lode, and remained in said place for the term of ninety days after the date thereof.

Sworn to and subscribed }  
before me,.....

Whereupon the following application may be issued by the party in interest, direct, or through the Land Office:

## V.—APPLICATION FOR SURVEY AND TENDER OF EXPENSES.

U. S. Surveyor General, San Francisco, California—Sir: Having complied with that portion of sections 2 and 3 of the act of Congress entitled "An Act granting the right of way to ditch and canal owners over the public lands, and for other purposes," approved July 26th, 1866, which requires the filing of a diagram and notice with the U. S. Register, and posting the same upon the mining claim known as.....in the.....District, County of.....California, we now apply to you to survey the premises and make a plat thereof, indorsed with your approval, designating this number and description of the location, the value of the labor and improvements, and the character of the vein exposed; and return a copy thereof to the Land Register of the United States for.....Land District. The expenses of which survey, etc., we herewith tender, and request that prompt action be taken herein.

Very respectfully, .....

When the survey has been executed and satisfactory evidence rendered, the Surveyor-General will furnish his official certificate of the same, which the applicants shall file with the Register and Receiver, and pay five dollars per acre for the ground contained in the plat. The Register will then transmit the proper documents to the General Land Office, when a patent may issue.

## United States Land Districts.

## CALIFORNIA.

No. I. Office at Eureka—Embraces the counties of Del Norte, Klamath and Trinity, the northern portion of Mendocino, and the western portions of Colusa, Tehama, Shasta and Siskiyou.

No. II. Office at Marysville—Embraces the counties of Plumas, Butte, Sierra, Yuba, Nevada, Sutter, Placer and El Dorado, the larger portion of Siskiyou, Shasta, Tehama, Colusa and Yolo, and the northern portions of Solano, Sacramento, Amador, Calaveras and Mono.

No. III. Office at San Francisco—Embraces San Diego, Santa Barbara, San Luis Obispo, Monterey, Santa Cruz, Santa Clara, San Mateo, San Francisco, Marin, Napa, Sonoma and Lake, and a portion of Mendocino, Colusa, Yolo, Contra Costa, Alameda, Stanislaus, Merced, Los Angeles, San Bernardino; also Arizona Territory.

No. IV. Office at Stockton—Embraces San Joaquin, Tuolumne, Mariposa, Fresno, Inyo, Kern, Tulare; principal portion of Mono, Calaveras, Amador, Sacramento, Solano, Stanislaus, Merced, and a part of Contra Costa, Alameda, Los Angeles and San Bernardino.

LYON MILL AND MINING COMPANY.—This company has been organized for the purpose of mining in the Kelsey Mining District, El Dorado county. The amount of their capital stock is \$120,000, and the time of their corporate existence to be fifty years. The number of shares is 1,200, of \$100 each. The trustees are A. C. Teitman, A. Walrath, W. H. Lyon, S. Kennedy, and James M. Classen.

## Weekly Stock Circular.

Of Associated Brokers of the S. F. Stock and Exchange Board.

SAN FRANCISCO, SATURDAY MORNING,  
March 9, 1867.

## MONEY MARKET.

We observe no material change in the condition of the money market since our last reference. The demand in commercial circles is light, trade being dull and merchants generally indisposed to operate in advance of wants. Notwithstanding the unpropitious character of the season thus far to many interests, the present condition of the mercantile classes and the prosperity attending business matters generally are favorable omens for the future.

## CITY STOCKS.

Transactions in city shares have been very limited during the past week, and no special inquiry manifested itself for any particular kind, with the exception of Spring Valley Water Company, over 200 shares selling within a range of \$68@66.50 per share; at the close \$66 is bid. California Steam Navigation Company sold at 65 per cent. For 50 shares of Bank of California stock \$134 per share was obtained.

## MINING SHARE MARKET.

The share market exhibited considerable tone at the close, and most leading stocks sold at an advance. Mail advices are still retarded by the almost impassable condition of the roads, and all mining operations are necessarily much impeded. The season has been one of extraordinary severity. Ore has been hauled with the utmost difficulty, and wood is said to be very scarce and in great demand by the millmen.

The trustees of the Savage Company, at a meeting held on Thursday last, resolved to subscribe \$150,000 to the stock of the Sutro Tunnel Company, subject to the approval of the stockholders at their next meeting. The subscriptions to this important enterprise are gradually assuming larger proportions, and now amount to \$365,000, as follows: Hale & Norcross, \$100,000; Gould & Curry, \$100,000; Savage, \$150,000; and Empire, \$15,000. It is said that if other leading companies would now come forward and subscribe liberally, this great work could soon be commenced.

The Eureka Mine of Grass Valley continues to maintain its former prestige. The regular dividend of \$30,000 for the month of February was declared last week, and since then an extra dividend has been disbursed to the owners of \$20,000, making in all \$2,500 per interest or share earned since February last.

SAVAGE—was dealt in to a considerable extent at enhanced rates, opening at \$1,930, gradually advancing to \$2,000, and closing yesterday at \$1,915. This company disbursed a dividend of \$100 per share to its stockholders yesterday, carrying over a cash surplus of about \$60,000. The supply of ore on hand on the first instant amounted to about 4,000 tons, of which 2,000 tons were at the mills. Mail advices from the mine to the 23d ult. say that the seventh station is yielding largely, and that the ore is of a better quality. The upper floors, on the sixth station, have also improved, and an increased yield is expected from the southeast face. The south winze, near the Hale & Norcross line, has been sunk to the depth of 95 feet and is in good ore. The required 130 feet, from the seventh to the eighth station, have been sunk, and the new station will soon be opened. During the week ending February 23d, 1,687 tons of ore were extracted from the mine, showing an assay value of \$62,634—equal to \$37.12 per ton.

CROWN POINT—is also in better favor, selling at \$850@855, then at \$390@900, and closing at \$900, b 30. The bullion returns for the month of February amounted to about \$115,000. On the 4th instant this company commenced drifting from the 500-foot station, and the prospects of finding a good body of ore on the east vein from this point are very encouraging. The average

yield of ore has been about 100 tons per day. The recently very heavy snow-fall has greatly impeded all mining operations on the Comstock.

YELLOW JACKET—has been quite active at an advance, realizing early in the week \$705@720, rising to \$750@770, then selling at a further advance, and closing yesterday at \$750. A statement forwarded to the office in this city, for the week ending February 18th, shows the production of this company's mine to have been 1,347 tons during that period, and the yield of bullion is reported to be over \$38,000.

CHOLLAR-POTOSI—has been largely dealt in at improved prices, over 600 shares changing hands, obtaining \$240@256, advancing to \$253 under a large sale, and closing at \$250. We learn that the receipts of bullion during the month of February exceeded \$100,000. The shipment of ore to mills for the week ending February 23d amounted to 956 tons. It is said that the ore taken from this mine within a month past has been of a better quality than for a considerable time prior.

IMPERIAL—is in marked request at advanced figures from our last quotations, with considerable sales during the week, steadily advancing from \$175 to \$195, seller 30, and selling yesterday at \$202. The bullion product for the month of February aggregated \$116,200, a gain over the January yield, notwithstanding it was a short month. It is said that the mines of this company never looked better. The mills are running full, and it is thought they will not be obliged to stop for want of ore in consequence of the bad condition of the roads.

GOULD & CURRY—is quite inactive—very few sales taking place; opening at \$475, improving to \$490, and at the close selling at \$475. The yield of bullion in February amounted to about \$55,000, being the product of ore taken from points above the fourth station. Prospecting on an extensive scale continues to be done without very satisfactory results at this date.

OPHIR—has been in more request this week than last, opening at \$215, advancing to \$242.50, receding to \$222, and at the close selling for \$223. Some predicate the activity in this stock within the past few days upon a streak of quartz encountered in the east drift from the tenth level, which is now in about 66 feet.

EMPIRE—exhibited considerable animation during the week, advancing from \$172.50 to \$182.50, and at the close \$181 is asked. Owing to the non-receipt of bullion detained in Virginia City this company have not declared their usual dividend. It is said that as soon as the roads are in a condition to transport this bullion a dividend will be made.

BELCHER—sold to a small extent within a range of \$107@120 per share. CONFEDERATE manifested some inquiry at declining rates, with large sales at the close, falling from \$15 to \$12, and selling yesterday at \$10. Assessment of \$25 per share delinquent on the 14th instant. BULLION has been purchased at declining rates—\$13@12.50, and rallying at the close to \$14, seller 10. The assessment of \$10 per share levied on the 9th of February will be delinquent on the 11th instant. EXCHEQUER sold at \$1 per share.

The aggregate sales of Stocks, Legal Tender Notes, etc., since Saturday last, amounted to \$873,863.

## City Amusements.

METROPOLITAN.—On Monday night, the prince of conjurers, Robert Heller, made his first appearance at this house, and the rush to obtain seats during the week has been unabated. His performances are very different from those of any other magician who has been here, and are wonderful. Added to this is his marvelous execution upon the piano, which is certainly not his least talent, while his small talk and puns, good and bad, keep the audience in a roar. The mystery of "second sight" should be seen to be appreciated.

OPERA HOUSE.—Miss Kingsbury's second piece, "The Mariner's Compass," was hardly more successful than "The Orange Girl," and was withdrawn on Monday night. On Tuesday night, "Arrah-na-Pogue," with Miss Kingsbury as Arrah, drew a very good house. Wednesday night, "Hamlet," John McCullough as Hamlet, and Miss Kingsbury as Ophelia. Thursday night, the favorite "Fanchon" was greeted by a crowded house. Friday night, "The Sea and Land."

WOODWARD'S GARDENS.—This pleasant resort has constant additions made to its already fine collection, and is well worth a visit.

## Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

The comparatively brief summary of mining news which our columns have presented for the past two weeks, is due to the persistent storm which has been prevailing throughout the State. It is reported from all quarters as having been the most severe on record. The last accounts from Meadow Lake, Nevada county, were to the effect that the snow was eighteen or twenty feet deep on a level at that place. In Sierra county, it is said to be from eight to twelve feet. Twenty-two inches fell during the late storm at Carson City. The Summit portion of the Placerville route to Washoe was completely blocked from February 20th to March 5th.

Although mining in many places has for a time been stopped, the snow fall will, undoubtedly, be on the whole to the advantage of the mining interest, in furnishing an abundant supply of water throughout the season. In the agricultural districts, the grain crops promise remarkably well, the amount of rain there having been proportioned to the amount of snow in the mining region. It is reported, too, that an abundant fruit crop is expected; every indication being at present favorable.

It is probable that more attention will be paid to quartz mining in California during the coming year than ever before. On all sides mills are being projected, and prepared for transportation as soon as the spring opens and the state of the roads will permit. "Rich strikes" are heard of in places long looked upon as "played out." Returning miners from Montana, Idaho and British Columbia, begin to look upon California as the place after all, and to wonder how "distance could have lent such enchantment to the view," as to so completely blind them to the "good things" which they now find to be had for the grasping; and they are content to make for themselves homes where they cannot only mine, with as good prospects of success as in the distant and inhospitable regions which they have left, but can do it under the shade of vine and fig trees of their own.

## CALIFORNIA.

## Amador County.

From the *Ledger* of March 3d: A. C. and J. C. Ham, Jr., struck diggings on New York Gulch from which they took over four ounces of gold dust this week.

From the *Stockton Independent*: The Lancha Plana Copper Company gives notice that proposals will be received up to the 25th instant, to run fifty feet of tunnel or drift in the claim. We understand it is the intention of the company to put on a large force in the spring, and prosecute the work in earnest.

## Calaveras County.

From the *Calaveras Chronicle* of March 2d: The labors of Paul, Hoerchner & Co., who have been engaged for the past three years in running a tunnel in their claim in Chile Gulch, were rewarded last week by striking through into pay dirt. The task of prospecting this claim was a herculean undertaking. It was estimated that it would take three years, and cost \$30,000, to run a tunnel to the lead, and time has proved that the calculations were nearly correct. The tunnel is eight hundred and thirty-six feet in length, and throughout the entire distance has been blasted through bedrock hard as adamant. During most of the time occupied in its completion, labor has been performed night and day, and from the time a pick was first struck in the claim, up to the present, work has never been interrupted.

Letter from Copperopolis to the *Stockton Independent*, dated Feb. 18th: The Union, Keystone, and other companies are hard at work. We are told that the former company have now as much ore in their different drifts and tunnels as they will be able to find transportation for during the next three or four years. The engines, machinery, and in fact the whole paraphernalia of this and the Keystone, adjoining, are of the best description and finished in fine style. The Caledonia, Empire, Inimitable, and other companies are also at work, though apparently with no very great success so far.

## El Dorado County.

From the *Placerville Democrat* of March 2d: The Valadoro Company, at Grizzly Flat, has a splendid 40-stamp steam mill in operation. The company have a shaft upon their claim 150 feet in depth, and at this depth the ledge is seven feet wide. The hoisting work connected with the shaft is complete in all respects, while the character of the rock taken from the shaft, has been too well tested to admit of any doubt of the complete success of the enterprise.

Letter to same from Georgetown, says: The old Slagger claim, at Spanish Dry Diggings, near this town, is turning out some remarkably rich specimens. The claim is now owned by W. Roush, John Wade, G. W. Sempers and G. W. Hunter, who are prospecting it thoroughly. The specimens taken out of it are dotted all over with gold, and the sulphurets are full of it. The old Taylor lode, near this place, is also turning out finely. Mr. Green, of San Francisco, bought it a few months ago; paid \$3,000 for it, and would not now take ten times that sum for it. It is about four feet thick and well defined. Gold is regularly diffused all through the whole ledge. Out of six pounds of unpicked quartz, taken at the depth of fifty-seven feet, Mr. Green got eleven dollars and sixty-ninety cents. The quartz was crushed in a common mortar and is considered only as a fair sample of the whole.

From the *Courier* of same date: Mr. Shepherd showed us, this week, the result of the first run made with the mill just erected on his lead on Poverty Hill. The amount of gold was a little over \$200, from four tons of rock. This is a very good showing, but should not be taken as a fair test of what the mine is, as five pounds of quicksilver was lost from the pans during the run, which of course contained more or less gold.

## Kern County.

From the *Havilah Courier* of Feb. 23d: The Burning Moscow mine, New El Dorado district, was sold a few days since to Jasper Harrold, of Visalia, for \$8,500. The mine is about being worked by Messrs. Taylor and Thomas. The Burning Moscow is one of the best mines in the county, and is about twenty-five miles from this place.

## Nevada County.

From the *Gazette* of February 27th: The Brush Creek diggings, now owned by Hall & Peabody, were located in 1851. The ground is a little over a mile in length, and the mining is done entirely by ground-sluicing. A gentleman who knows, informs us that the claims have yielded to the different owners over three million dollars. The claims owned by Lones & Co. had yielded over \$300,000, when they sold out to Hall & Peabody in 1865 for \$28,000—being a part of the ground now held by the latter. The gross yield of the diggings in 1866 was \$32,800, the profits amounting to \$12,000; and it is expected the claims will yield better this year than last.

From same of March 1st: Rodney Wing recently struck a rich quartz ledge at Wood's Ravine. He had been working a gravel claim, in which he found many rich quartz specimens, and at length struck upon the ledge, which is about a foot in width and shows much free gold.

Same of 2d: We saw yesterday a bar of gold valued at a little over \$1,500, the result of a clean-up of 120 tons of rock from the mine of the Nevada Quartz Mining company. This gives a yield of twelve and a half dollars a ton. From Wm. M. Ratcliff, superintendent, we learn that during the year 1866, the mine yielded 5,000 tons of rock, which crushed in the mill \$42,000, while the sale of the sulphurets amounted to \$8,000 more.

From same of March 5th: A party of sixteen men arrived in town yesterday from the mill and mine of the Jim company, in Eureka township. They had to suspend operations on account of the deep snow. From one of the party we learn that they completed the mill and crushed some two hundred tons of rock; but not having a supply of wood on hand, they were compelled to stop the mill some time ago. The snow is some twenty feet deep at the mine. Two or three men only were left at the mine, to take care of the property until the snow melts off sufficiently to enable them to resume operations.

From the *Transcript* of March 2d: The snow at Eureka is still seven feet deep. The canals and ditches in the neighborhood have been blocked up, and many of the flumes have been carried away by slides of snow. At the upper camp on the Miner's ditch, snow fell to the depth of fifteen feet during the late storm. Jackson's mill, at Eureka, was crushed by the weight of snow, and the building totally destroyed. The storms have seriously interfered with mining operations, and most of the mills have stopped on account of the impossibility of getting wood and rock. The snows are heavier this season than they were ever known before.

Letter from You Bet, Feb. 22d, to the *Dutch Flat Enquirer*: There is plenty of ground to work by hydraulic-power for years, and the result will be good profits; but the great agent for working it—water—must be reduced in price before any substantial operations will be undertaken.

The great "Blue Lead," of which so much has been said, is now being worked more extensively and successfully than ever.

The famous mine owned by the Brown Brown Bros., is to this day the best paying claim on this divide. Large profits have been realized from this mine for the last two years. One of the brothers, H. K. Brown, has sold his interest in the mine to his brother, Judge Brown, has retired from mining with a fortune, and is now proprietor of the Grass Valley and Nevada Stage Line. Two years ago he was a poor man.

Mallory & Brother, adjoining the Brown mine on the north, have some excellent "paying dirt;" they are running their mill night and day, and work a force of twenty men, 9½ hour "shifts," and their profits are better every week.

M. J. Hydelliff, of Red Dog, is the owner of a 10-stamp mill. He has just commenced crushing, and as near as I can learn, the pay is good. He is working about twenty men on eight-hour "shifts."

From same of March 6th: Stiles' mill has been thoroughly overhauled and repaired, and the whole battery of eight stamps will be started up to-day. The mill is considerably improved, and its capacity has been doubled by the repairs. A lot of rock from the northern extension of the Star Spangled Banner mine will be worked first.

A lot of rock from the Liberty mine at Eureka is being worked in the arastra of Booth & Co., at that place, and is yielding handsomely.

The Young ledge at Eureka, owned by Black & Young, is being steadily worked, notwithstanding the snow, which lies nine feet deep at the mill. The ledge, four feet wide, has been stripped for three hundred feet. The rock is studded with fine gold. The company has one hundred and fifty tons of this rock at their mill, and can keep the mill constantly at work. They have an abundant supply of wood on hand.

EXCELSIOR.—From the *Meadow Lake Sun* of Feb. 23d: The snow has now reached the average depth of about eighteen feet. The Mohawk, California, Gold Run, U. S. Grant, Golden Eagle and other claims that have worked through the winter, are still at work, and do not experience the least difficulty.

The Mobawk and Montreal company have just got their mortar, a casting weighing 2,500 in place, having brought it from near Cisco, where it was left in the early part of the winter.

## Placer County.

From the *Dutch Flat Enquirer* of Feb. 27th: We learn it is the intention of the companies at Cañon Creek and Gold Run to work their claims day and night as soon as the weather will permit. The miners immediately in the vicinity of this place will also commence operations in a short time, the water facilities being better now than ever heretofore.

Letter to same from Colfax: Judge Heard, formerly of Sacramento city, has made a location of a vein of ore that prospects beautifully; it is wide and mostly sulphurets rock. He purposes erecting works upon the vein the coming season. The Rising Sun and Colfax companies are also locations near this place that prospect well; rock from the former has paid as high as \$55 to the ton.

Iowa Hill letter to same of March 2d: Our mining companies are now busy, and have fine prospects ahead. The Morning Star Company's little 6-stamp mill is turning out regularly from \$4,500 to \$6,000 per month; the Oriental mill at Wisconsin Hill has stopped until such repairs as are necessary can be done, and a tunnel run through a heavy bank of cement; the Lebanon Hurdy Gurdy mill is said to be paying better than ever before. Wm. Weisler, who owned a large interest in the old Jamison claim at this place, sold his entire interest a few days ago for eight thousand dollars; the claim is at present paying well. The Sailor Union, another one of our oldest claims, is at present paying well. Others, located at Wisconsin Hill, Monona Flat, Bird's Flat, Grizzly and Sucker Flats, and Elizabethtown, are being worked with fine prospects.

The Mountain Gate company at Damascus have been realizing for the past two years three thousand dollars per month, until the recent cave in their tunnel.

From the *Herald* of March 2d: The Wells' Quartz Mining company have recently had a crushing of twenty-five tons of their rock at the Welty steam mill. The yield was forty-one ounces of amalgam.

## Sacramento County.

From the *Folsom Telegraph* of March 2d: We hear of rich strikes and successful min-

ing in every direction in this neighborhood. Water is plenty, and every man that wants a claim can find one, and make good wages. No man need be idle now.

## Shasta County.

From the *Courier* of March 2d: Several assays have been made of South Fork rock during the past week, and the result has been encouraging. We were shown a gold "button" weighing one-fourth of an ounce, which was extracted from quite a small piece of rock taken from the Pacific lode. Another assay made from ore taken from the Ellsworth lode yielded \$92 in gold, to the ton.

The Potosi rock, at Muletown, is continually growing better as the shaft descends.

A Mr. French, at Chumtown, has averaged \$6 per day, reducing rock in a common hand mortar.

Kelly & Co.'s mill at Muletown is completed.

About Middletown, the miners are doing well. Mr. Kellner, who has been ground sluicing, picked up a piece of pure gold on Wednesday worth \$100. Several smaller pieces were picked up by the same gentleman during the winter. Heivner & Co. are doing well. Water is cheap and abundant.

Henry Ludwig, of the Ohio claim at South Fork, has been engaged for several months in running a tunnel. Last week he cut through the casing and struck as fine looking a lode, of gold and silver bearing rock, as has ever been found in the district.

We are informed that the placer mines on Mad Ox and Mad Mule creeks are yielding as well this winter as they did when first discovered. There is scarcely a claim worked on either stream that does not yield as high as an ounce a day to the hand, and some of them are yielding double that amount. The gold is coarse, and pieces weighing several ounces are frequently found.

## Sierra County.

From the *Downieville Messenger* of March 2d: The Higbland and Masonic Mining company at Alleghany, are reported as taking out about two hundred ounces per week. The company have breasts, one on each side of the tunnel, of about sixty feet each. The claim probably never was in a better paying condition.

Parties are at work opening the old Hook & Bell tunnel at Alleghany, with fair prospects of finding a paying ting.

The mining news is unusually meager from this region. The *Messenger* says the storm has been the most severe ever experienced there. Most of the roads have been impassable. The snow is some eight or ten feet deep.

## Siskiyou County.

From the *Yreka Union* of February 23d: At South Fork, Scott River, the high water has caused a suspension of work in a great many claims, but those in which work has been prosecuted are generally paying well. Pollard's claim, Messner & Co's claim, and the Chain-Gang claim are mentioned among those yielding well at present. It is said Messner & Co. took out about \$250 last week, to three men's labor. Timmons & Co. have been driven out of their drift by the water, but are at work on the outside.

Chapman & Peale, on Fox Creek, took from a drift they are running, some days since, a nugget of over forty dollars.

## Yuba County.

From the *North Californian* of Feb. 27th: The Pennsylvania and Jefferson Companies have resumed work. This last heavy rain stopped successful operations for two or three days. The prospects of both claims never looked more flattering than at present, and we may expect at an early day to record large dividends from Brown's Valley.

A Smartsville letter to the *Grass Valley Union*, Feb. 22d, says: The mining interest here is looking up. Pierce & Co., (Blue Gravel claims) have been running for some time past, and will soon clean up. The Pittsburg will also soon make a clean up, and the claims promise to yield well. The Blue Point Gravel Company have been at work for some time on their new tunnel, and do not expect to complete it for three or four years to come. It is in this tunnel that the experiment of blasting with nitroglycerine was first tried, it proving a partial success.

## ARIZONA.

Mr. W. C. Reed, who returned from Arizona a few days since, reports the discovery of very rich and extensive gold placers sixty-five miles southeast from Prescott. A party who came into Prescott for supplies from the new mines, brought abundance of gold dust, and reported that the placers were so extensive as to afford work for some thousands of men immediately.

The San Bernardino *Guardian*, of a recent date, says: A party of prospectors have been

at work on Black Cañon, and discovered diggings which pay eight dollars per day.

A lot of copper matte from the Great Central mine at Williams' Fork, left San Francisco by the steamer of February 28th for New York.

#### BRITISH COLUMBIA.

From the *Victoria Colonist* of Feb. 23d: The good news from Cariboo is confirmed. The Stewart Co. have struck a well defined ledge—gold visible throughout, and the Washburne struck the ledge on the 3d inst.; it is reported even richer than the Stewart.

On William Creek things never looked so well. H. can sell his interest in the United Company in Conklin's Gulch, for \$10,000. They have struck the old Eriesson lead, and it is immensely rich.

A gold and silver quartz discovery is reported near Cowichan. The discovery of gold quartz was made by an Indian, and created considerable excitement. The discovery of silver was made by a settler named Davis.

A letter from William's Creek, Cariboo, to the *British Colonist*, dated Feb. 3d, says: We are in the middle of excitement here again. All Conklin's Gulch has been fresh staked from the bottom almost to the top, on both sides. The United Company made very heavy pay before they were obliged to lay off. There are a great number of tunnels running. The United are running a fresh tunnel. The Home Stake have run one, but at too high a grade, and have commenced to run a fresh one. The Hood Company have tenders out for a fresh tunnel. The Homo Ticket is in considerable favor; got a good prospect on the rim. They are now putting a new shaft down to strike the channel.

On Canadian Creek there has been very great excitement, and it has been staked off from top to bottom.

A telegram from Victoria, March 5th, says: News of the most cheering character was yesterday received from the Cariboo mines. Several rich strikes have recently been made, and there is every indication of a very prosperous season.

The Government has offered a premium of \$50,000 for the first quartz mill erected in British Columbia.

#### CENTRAL AMERICA.

*El Porvenir*, published at Rivas, Nicaragua, gives this description of the Jabella mine, purchased last year for the Central American Association. It is situated in the Chontales district of Nicaragua. "The lode is of steady, uniform richness, and will hold out at least half a century, even if it has to feed all the machinery that can be worked with the available water power. It runs from east to west, is generally from eight to ten feet, but in some parts as many as twenty feet wide, and it contains gold and sulphurets of silver. From the general samples taken and washed, the average produce of gold is above one ounce to the ton, but never less; and in some places, as, for instance, in the bottom level, forty ounces the ton. The greatest depth attained in the present workings is fifty yards, and at that depth the lode is decidedly richer than it is toward the surface of the mine."

#### IDAHO.

From the *Owyhee Advertiser* of Feb. 16th: The Silver Cord mine is said to be showing a body of rich ore in the third level, and also on the face of the second. There is no doubt of the fact that ore taken from this ledge has yielded at the enormous rate of \$2,600 per ton.

The contractors to run the No. 1 Hays & Ray tunnel 400 feet, have already commenced work.

Mr. Lewis, of the Cosmos company, is now applying a new process with rich results.

Flint district ores which yield by common mill process only fifty-two dollars per ton, give \$404 by the process of Mr. Lewis. This great advance in yield is the result of saving the sulphurets. The same ore when roasted only gives a product of \$223 per ton. The process of saving the sulphurets is much easier than the old method, and avoids roasting and amalgamation in pans.

In Flint district, Carter & Co's mill is crushing rock, and the machinery works well. The roasting furnace is ready, except the chimney—and but for the severity of the weather that would have been completed. The ore being crushed is from the Rising Star. The treatment will be first to crush, then to roast, and lastly to amalgamate in the usual way.

In Boise county the ditches are so filled with ice and snow, that weeks will be consumed in clearing them in the spring.

#### NEVADA.

##### Black Rock.

From the *Territorial Enterprise* of Feb. 20th: Reports from the Black Rock mines still continue very flattering. A mill will soon be in operation in that region. We

believe that these mines will make much noise in the mining world before another year rolls round. The ores of Black Rock present rather a strange appearance to those who have been accustomed to see few ores but those taken from the Comstock lode, but they seem to be fat.

##### Esmeralda.

From the *Virginia Tresspass* of Feb. 20th: At Pine Grove, the new camp between the east and west branches of Walker River, we learn that a mill, partly owned by Captain Pray, has commenced to crush ore from the Himalaya and Midas mines, and will make the first "clean-up" about the first of March. Two other mills will be erected during the coming months of spring, and it is believed by all the settlers that the country is one of exceeding mineral richness. Wood and water are abundant.

##### Humboldt.

From the *Register* of February 16th: At no period in the history of our county have the prospects of our mining interests looked more flattering than at the present time. Among those in this district whose prospects of a rich strike at an early day look the brightest, are the North Star and Agammon companies, in both of which Eastern capitalists are interested. Work on these claims goes on steadily day and night, and seams of ore, of a superior quality, have been cut in the tunnels of both companies. Superintendent Loomis, of the North Star, last week forwarded five tons of ore to the Pioneer mill, which yielded \$523. The Agammon has a fine looking pile of ore at their dump, which will, on the return of Superintendent J. C. Fall, be worked by mill process.

The Nevada Star company are now working the Yankee mine. They have been at work for some time driving in a long tunnel, which will intersect the mine about three hundred and fifty feet from the surface. They believe they are now in the neighborhood of the vein. When it is reached they propose to erect reduction works upon their mill site near the mine on Star Creek, where fine water power can be obtained for trifling cost, for large and extensive works.

James T. MacLean, of the Sheba mill, made another shipment, by Wells, Fargo & Co's Express, of 798 ounces of fine bullion from the Yosemite mine.

##### Reese River.

From the *Reveille* of Feb. 16th: The shipment of bullion obtained from the ore extracted from the Florida mine during the month of February, was made to-day through Wells, Fargo & Co. The amount is \$12,531.95, contained in twelve handsome bars. The ore was reduced at the Keystone mill, and was worked up to 88½ per cent., and the bullion averages 825 in fineness. We are informed that the yield for the month of January exceeds the disbursements fully \$6,000. Major Sherman's estimate for the yield of bullion for the current month is \$20,000. This is one of the razor blades! The vein has suddenly increased in width to fifteen and twenty-two inches, and is loaded with rich mineral.

Same of 18th: The stage from Belmont brought in on Saturday five bars of bullion, valued at \$4,670.27, from the mill of the Twin River company.

From same of Feb. 20th: In Reveille district, the Rutland and Reese River Company is pushing work forward with great energy. Some ten tons of good-looking ore have been taken out of the Mohaska ledge, and about the same amount from the Bay State. These claims are being well opened, and the indications are favorable. In the judgment of our informant the ore obtained from these ledges will yield \$100 per ton. The mill is on the western side of the valley, about ten miles from these mines, and is convenient to those of the Hot Creek district. The location is excellent, embracing a good water-power and a large tract of timber, beside having in its vicinity an extensive salt deposit. The mill building is nearly completed, and the machinery is being put in place with dispatch.

Same of 21st: We learn from Col. Buel, who arrived by the last stage from Belmont, that the High Bridge and Transylvania are looking heartily. Plenty of very rich ore is being extracted from the Buel claim on the former. The mill has been idle for some days in consequence of a broken pump, but that had been replaced by a new one, and they were to resume work on Tuesday last.

Same of 22d: A number of the Hot Creek claims are being developed. . . . Two bars valued at \$1,920 came in last night from the Twin River company's mill.

##### Washoe.

[In the Stock Circular, in another portion of this paper, will be found late mining news from this district.]

From the *Virginia Tresspass* of Feb. 19th:

The Union mill, at Gold Hill, has been stopped. Cause reported to be an attachment.

The new engine and machinery at the Plato mine, Gold Hill, have been erected, and are now running in fine shape. Through the Plato mine ore is being hoisted from the Bowers and Eclipse mine, and, at present, 100 tons are raised each twenty-four hours.

The Dana, Island, and Ophir mills, of Dayton, which have been working Savage rock, have all stopped. The Franklin, which has been running on rock from the Yellow Jacket mine, has stopped; and the Illinois, supplied from the same mine, is out to-day. The Sacramento mill, formerly running on Empire rock, has run out and is now running on tailings. The Excelsior is also out of rock, and employed on tailings. Weston's mill is running, supplied from Crystal Palace mine. Dayton mill, J. D. Winters & Co., running on rock from the Consolidated.

Same of 20th: Some prospectors, Byron, Stafford and others, made what promises to prove a valuable discovery, a few days ago, about 2½ miles southeast from Dayton. The discovery is a ledge of about fifteen feet in width, showing silver sulphurets, and apparently very rich. It appears to be a well-defined vein, and is in an excellent place for easy working—an abundance of wood and water within easy reach.

#### Silk—Its Manufacture.

Much has of late been said in reference to the raising of silk in the United States. It will, undoubtedly, be extensively done. But it takes time to inaugurate the enterprise, by growing the mulberry trees to a sufficient size to bear the necessary striping. Why do not some of our manufacturing capitalists meanwhile commence the importation of raw silk, upon which there is no duty, and produce here the fabrics for which we are paying such extravagant prices? The duty upon manufactured silks is enormous. It seems strange that this manufacture has not been undertaken more extensively in the United States. We understand that Messrs. Newman and Myers do not expect to rely solely, for the present, upon California cocoons to keep their new silk factory in operation, although it is probable that they can do so in the course of a year or two.

A correspondent of the *Boston Journal* writes from Florence, Italy, as follows:

"This whole section of country is more or less engaged in silk raising. The plains of Lombardy are planted with mulberry orchards, and at the foot of each mulberry tree you see a grape vine. Very little of the silk raised is manufactured here. There are a few manufactories of silk goods at Milan, but nearly all of the raw silk is purchased by Swiss merchants, taken over the Alps to Zurich and Northern Switzerland, manufactured there, and then shipped to the United States. The American Consul at Milan, Rev. Mr. Clark, informed me that he has been approached by some of the Milan merchants, who desire more intimate commercial relations with the United States. They wonder that the Americans, who, they say, are the most ingenious people on the earth, do not manufacture silk, instead of paying the Swiss for doing it, and then paying a heavy duty upon the manufactured goods."

The above is directly to the point. We believe it would be a profitable business to import Chinese and Japanese cocoons, or at least the raw silk from them, and manufacture it in California.

**FOSSILS IN IDAHO.**—The skeleton of an immense animal was found last summer on Slate Creek, Salmon River region, Idaho. It was about forty feet below the surface. It crumbled to pieces when an attempt was made to remove it. Two teeth remained, one of which weighed six pounds eight ounces. One who was present thus informs the *Alta*.

**CANALS IN CALIFORNIA.**—Mr. McRuer has introduced a bill into Congress to grant ten sections of land per mile to a company which proposes to make a canal for navigation and irrigation from Red Bluff to Suisun Bay, and it is said that a similar bill is soon to be introduced for the benefit of a canal from King's River to Suisun Bay.

**STILL THERE.**—A scientific man, who visited California in 1819, published a volume on its flora. He mentions finding the only specimens of a certain flower which he ever met with, at San Diego, near the sea and "beneath a shelving rock." Professor A. Wood, who was at San Diego last summer, determined if possible to find the rare plant. After considerable search he came to "a shelving rock" by the shore, and upon looking over it he beheld the object of his search in full bloom, and on the very spot where it had flourished forty-seven years before.

**"E PLURIBUS UNUM—ERIN GO BRAGH."** We have been presented by the author, Mr. J. M. Doherty, with a copy of a little book entitled "Paddy Pungent; or, a Rambling Irishman right from the Ould Sod." No comment is necessary upon this publication. The title alone tells the story.

**American and Foreign Patents.**—Letters Patent for inventors can be secured in the United States and foreign countries through the Mining and Scientific Press Patent Agency. We offer applicants reasonable terms, and they can rest assured of a strict compliance with our obligations, and a faithful performance of all contracts. For reference, we will furnish the names of numerous parties for whom we have obtained patents during the past two years.

SUBSCRIBERS who do not receive the *Mining and Scientific Press* in due time, are requested to inform the publishers.

**A Canvassing Agent** for the interior, is wanted at this office. None but a thorough and experienced man need apply.

## Canvassing Agents.

**Mr. A. C. Knox**, is our city soliciting and collecting Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office.

**Mr. L. W. Felton**, is an authorized agent for this paper at Portland, Oregon. Dec. 1, 1895.

**Mr. E. L. Smith**, is a duly authorized Agent for this paper. February 25, 1897.

## San Francisco:

Saturday Morning, March 9, 1867.

## Notices to Correspondents.

**TEURON.**—The gold mines of the Ural are very ancient. Pallas, in his travels, describes the remains which he examined at these ancient workings, which were subsequently visited and more fully described by Lepechin and Gmelin, from which it would appear that they had been originally wrought by a very primitive and probably nomadic people, possibly the ancient Samatians, more generally known under the denomination of Scythians. The extent of the ground covered by ruins shows that the workmen engaged must have been numerous; a careful inspection of the workings, show that mining was in a very rudimentary condition. Some implements found were of so singular a character, that no one has yet been able to satisfactorily explain their uses. Wedges and hammers of copper have been discovered which, on analysis, have been found to be devoid of gold. These implements had been cast—not wrought. In place of sledges, large stones of an elongated form were employed, many of which had marks, which showed the manner by which the handles were fastened to them. In some cases it would appear that the gold had been picked out of the vein by means of picks formed of boars' tusks, and gathered in leather bags or pockets, several of which have been found. Some of the pits worked by these "old men" have a depth of 120 feet, are generally bell-shaped and about seven feet in diameter. The passages and supports are described as being well executed, but the former are narrow and low, possibly because this ancient race was of diminutive size. In one instance, it was found that where the shaft had been sunk to a considerable depth, the work appeared to be abandoned after penetrating a few feet of hard stone, which was barren. The natural pillars left to support the roofs are in numerous instances still effective. In other instances, where the supports have given way, human bones are sometimes found, probably the remains of the primitive but unfortunate miners. Numerous fragments of earthenware are scattered around the vicinity. Probably only the richest ores were selected, which in some instances must have been smelted in the mine, as under the debris of one of the supports which had fallen in, melted copper, and the apparatus for smelting it have been discovered, and many such have been found around the mouths of these pits. The smelting, whether in the mines or on the surface, was performed in small furnaces, of which Gmelin observed near a thousand in the eastern part of Siberia. They were constructed of red bricks, in the remains of which pieces of copper have been found weighing from two to three pounds each. The height and breadth of these furnaces were about two feet, and the length three feet. Holes were found in the front and back; but which were for the purpose of conveying the blast could not be ascertained. Large heaps of scoriae lay around these furnaces, but no one as yet has been sufficiently curious to ascertain by analysis what, or if any metals can be traced in these ancient slags. A long period must have elapsed since these ancient metallurgic works have been abandoned, as the roots of large fir trees are often intermixed with the stones that abut against the sides of these furnaces.

## Gold Amalgamation—The "Flouring" of Quicksilver.

One of the largest sources of loss in gold mining, is undoubtedly due to the "flouring," and consequent loss of quicksilver. It is not the loss of the quicksilver alone that constitutes the waste; for, as is well known, quicksilver, passing off in that condition, carries away with it a considerable amount of gold—which amount depends upon the mechanical fineness of that metal, and the proportionate quantity of the same in the quartz which is being worked. This loss does not commence when the charge is first placed in the battery or pan; but only after the crushing or grinding process has been continued for a considerable length of time, and the quicksilver has become more or less charged with the auriferous product. Any process of grinding or other violent agitation, breaks up the quicksilver into infinitely minute globules, which refuse, with more or less persistence, to reunite. These globules are so very minute that they readily float on the surface of the water, and are easily carried off with it to waste. This tendency to division is a great objection to the use of quicksilver in the batteries, which would otherwise constitute a most valuable aid to the process of amalgamation. We apprehend, however, that quicksilver so used, in very small quantities and at frequent intervals, will always be found very advantageous. None but the very cleanest, however, should be employed for the purpose. A very soft sodium amalgam would doubtless be better than quicksilver alone—not that the sodium would remain with the quicksilver for any appreciable length of time after being placed in the battery, but because quicksilver so used would be more likely to be free from the various oxides with which it is almost invariably accompanied, to a greater or less extent. It is well known that the slightest coating or touch of quicksilver to a particle of gold, is quite sure to cause it to be safely incorporated into the first body of amalgam with which it comes in contact. Hence, if the gold in the battery can be rendered thus sensitive to the action of the quicksilver, when it reaches the rifles or amalgamators, an important advantage has been gained. Perhaps the best way to use it in the battery is to mix it, as above, with the rock on the platform.

Some millmen have altogether discarded the use of pans, in consequence of the tendency which the friction produced by grinding has to cause this "flouring." This has been done, in some instances, after the pans have been purchased and erected at great expense; while resort has subsequently been had to the old plan of amalgamating without trituration. Such we should call very bad management. We look upon trituration of either a portion or the entire sands from the battery, as an indispensable requisite for a proper treatment of auriferous ores. Many use blankets, and put only the "blanket washings" through the pans. No doubt this process is sufficient for some kind of ores; although we could not recommend it in all cases—as, for instance, where very fine gold is found pretty generally disseminated through clean quartz. The small quantity of gold contained in sands of such rock will not give a sufficient specific gravity to the particles of sand to retain them on the blankets. Blankets are least useful in proportion to the fineness of the auriferous product.

We have little faith in any very free use of quicksilver in pans. Trituration should be either done apart from quicksilver, or the charges treated should be subjected to a careful after-manipulation, to collect the quicksilver—a large portion of which will be most finely floured. Very hot water and caustic soda or sodium amalgam, is an almost indispensable requisite to recover such quicksilver, and the gold which it may contain. A rapid manipulation of the mass

is unavoidably attended with considerable loss. Generally, the agitation for a while, and subsequent quiet for settling, are the only conditions of success.

"Flouring" is not produced altogether by friction; although friction is a great aid to other causes. It is no doubt often caused, to a certain extent, by chemical action. The sulphur, lead, copper, iron, arsenic, and other minerals with which gold and silver are almost always associated, furnish, by their partial decomposition, a film coating of oxide or other matter, to the minute globules of quicksilver, which destroys their tendency to unite; and as the trituration proceeds, these globules are continually being divided and sub-divided, until they are so completely "floured" that the "coating," above described, constitutes their chief mass, and renders them so light as to float on the water and pass off, whenever there is an escape, as readily as so much fine sawdust would wash away.

When thus divided, no mere mechanical action can remove this coating of oxide, so as to permit them to reunite. A chemical action must supervene. To this end we know of nothing better than "sodium amalgam," which seizes with avidity upon the oxygen contained in the "coating" of the particles; which being removed, an instantaneous union takes place. Quicksilver, no doubt, often forms a sulphide, in the process of trituration, from which it is recovered with still greater difficulty.

There is one important fact, however, connected with the "chemical action," which should be always borne in mind. The sodium employed to free the "coating" of the particles of quicksilver, while it takes up the oxygen leaves the late oxide in a metallic form, free to combine with the quicksilver, if it is one which will form an amalgam therewith, as is the case with copper, lead, etc. These metals, when they have accumulated to any considerable extent, must be removed by careful retorting. It will thus be seen that sodium does not purify the quicksilver, as many suppose; it merely removes the oxygen from the oxides, which are a greater detriment than the metals resulting from those oxides. The metals can only be removed, conveniently, by retorting.

A series of careful experiments to ascertain the true nature of the "flouring" of quicksilver, and the condition under which it occurs or may be avoided, would be of great public advantage. Such a work should be undertaken, carefully carried out and reported upon, at the expense of the government, and for the benefit of the mining interest. The advantages would be well worth the cost.

If perfectly clean quicksilver could be ground with clean sand, in a clean pan, without any "flouring;" or, if pulverized quartz containing gold, but entirely free from the baser metals in any form, can be similarly worked with the same result, sufficient proof would be adduced to show that friction, alone, is not the cause of this annoying phenomenon, and the conclusion would be inevitable that chemical action was at the bottom of it. Then the inquiry would be, as to the precise chemical changes which take place; what may be their immediate exciting cause; whether or not there is any galvanic-electric element involved, etc., etc.

It is more than possible that the mutual action of the metals, the one upon the other, or of the pan upon the metals, or *vice versa*, may have an important bearing in producing a chemical action, galvanic or otherwise, which may in some measure be partially or entirely neutralized. However this may be, it is sufficient for us to know that much difficulty exists in this direction, which is not well understood, and the solution of which is a matter of such general interest as to fully warrant a careful examination and elucidation at the public expense. In this connection, we realize the great importance

of a national assay office, one of the duties of which should be the investigation of such matters as the above, with many others of a like nature, which are constantly coming up.

The leading governments of Europe are fully aware of the great national importance of such establishments. The Prussian government is now greatly enlarging its facilities and efforts in this direction. That government is now constructing two immense laboratories, one at Berlin, the capital of the new Empire, and the other at Bonn, to be convenient to the celebrated University in that city. These establishments will be, each, about two hundred feet square, and will be under the chief direction of Prof. Hoffman, the distinguished chemist and author, who has lately resided and lectured in London. These are being fitted up for almost every kind of experimental work, in chemistry and metallurgy, with lecture-rooms, museums for specimens, etc., etc., almost regardless of expense. Every question of public interest, in chemistry or metallurgy, will there be carefully studied and analyzed, and the results made free to the public. Our own country can never hope to compete successfully with other nations in the economical applications of the arts and sciences, especially in the great underlying sciences of chemistry and metallurgy, until more liberality and intelligence is manifested in establishing public laboratories of this kind for the use and benefit of the people.

"THE FINANCIAL ECONOMY OF THE UNITED STATES ILLUSTRATED, and some of the causes which retard the progress of California, demonstrated." This is a new book of 350 pages, by John Alexander Ferris. It is inscribed to "The friends of our constitutional currency—gold and silver coin; to the advocates of justice and right" etc., etc.

The object of the work is fully apparent from the above. The constitutionality of the California Specific Contract Act is defended. The whole question of currency, paper and metallic, with the relation of Government to it, is taken up. A chapter is devoted to the tariff, first to the mineral lands, and one to the Pacific Railroad, and their respective relations to the main question considered. The subject is a most interesting one, not only to Californians, but to all interested in the general subject of financial economy. Published by A. Roman & Co., of this city.

**MECHANICS' INSTITUTE—REGULAR MONTHLY MEETING.**—This was held on the evening of the 7th inst. Reports of committees were read and approved. The Annual Report of the Treasurer was read and accepted. That of the President was ordered spread on the minutes, and 1,000 copies printed for distribution among the members. A committee of three was appointed to report at the next meeting a series of resolutions, expressive of the views of the Institute on the proposed Sutro Tunnel, and an effort to induce Congressional action in aid of it. The project of holding an Industrial Exhibition this year, to aid in liquidating the debt of the Association, was debated, and the President, on motion, was requested to see the owners of the new Pine street market building, in regard to renting the same for a few weeks, before it is opened as a market.

**THE BULLION YIELD FOR FEBRUARY.**—By reference to the *Weekly Stock Circular*, which will be found in another column, it will be seen that the bullion yield for February, of six of the principal mines on the Comstock lode, amounted to \$564,000—as follows: Crown Point, \$115,000; Yellow Jacket, \$38,000; Chollar-Potosi, \$100,000; Imperial, \$116,000; Gould & Curry, \$55,000; Savage, \$80,000 in dividends and \$60,000 carried over in cash surplus.

**BENJAMIN SILLIMAN**, the distinguished Professor, arrived on the last steamer from the East, on his second visit to this State.

## The College of California.

Quite a large gathering of the literary and "solid" men of California was held at the Board of Supervisor's room, in the City Hall, on Tuesday evening last, to originate measures for the permanent endowment of the College of California. This institution has struggled along for fourteen years, under all the disadvantages incident to a new country, and with very little assistance from the general public, until it has finally attained a standing and importance, most creditable to itself and the State, and highly encouraging for the future. It has graduated three classes, and fully established its curriculum. It has acquired a site for its future and permanent location, which has no superior for salubrity, convenience and general excellence on the entire Pacific coast. It has secured the esteem and respect of all classes of our citizens, and has already gathered around its young existence, associations and hopes of the most interesting and encouraging character. In its efforts to sustain itself and to do for itself, it has fully earned the right to exist and to look to the public for that aid and assistance, without which no similar institution ever did or can acquire a position of large and comprehensive usefulness. It is, and it is intended to be, the people's college; and the people, from San Diego to Puget Sound, should unite their efforts to raise it to the dignity and importance of a University of Learning.

We need, and must have a University on this coast, and the meeting on Tuesday evening was a most gratifying and promising evidence of the earnestness of the people in this matter. Clergymen of all denominations, people of every profession and almost every calling, merchants of "solid" pretensions, young men of small means, but big hearts—big in hopes and resolves for the future—were there as one man, all animated with one purpose—to institute measures for the permanent endowment, and making the first College of California, not only what it is in fact, but what it should be. The Rev. Dr. Stebbins presided, and made a most excellent and powerful appeal in behalf of the College, at the head of whose Board of Trustees he has been placed. He was ably seconded by Dr. Stone, the Rev. Messrs. Willey, Benton, and Messrs. Thomas Hardy, J. W. Stowe, I. P. Rankin, J. W. Dwinelle, William Sherman and George Barstow. The utmost enthusiasm prevailed, and a firm resolve was manifested to carry out to the letter, the work initiated—to raise a permanent endowment fund of at least \$100,000. Of this amount, \$20,000 is already pledged in four subscriptions of \$5,000 each. Several other \$5,000 subscriptions are confidently expected. Quite a number present intimated their intention to put down large and liberal amounts, after the \$5,000 men have all come in.

With this aid, and their present property, the College will be able to get along very respectably for a while. It is well known to some, at least, and perhaps it is not improper to make this public mention of the fact, that wills are already in existence, and of which there is no human probability of any change, which must, in the nature of things, soon bring the College nearly a hundred thousand more. It is, moreover, confidently expected that the munificent Congressional appropriation for an agricultural and mining school, must necessarily fall into the care and keeping of this institution. It would be next to throwing away that fund to make any other disposition of it.

We have here a nucleus, around which are clustering the highest literary associations and hopes of the State. A beginning has been made where the lovers of science, who would imitate in some degree the noble example of the munificent Peabody, may build for themselves monuments more noble and more lasting than brass or stone, and perpetuate their names forever in the grateful hearts of all coming generations.

Stair Work of all Kinds.

MADE TO ORDER

And Shipped to all parts of the Coast.

## California Academy of Natural Sciences.

REGULAR MEETING.

SAN FRANCISCO, March 4, 1867.

President in the Chair.

Thirty members present.

Messrs. William Norris, J. M. Sibley, John E. Nyström, Cornelius B. Miller, Ross E. Browne, Theo. P. Painter and Captain Henry Pickel were elected resident members.

Mr. William H. Dall, now collecting in Russian America, was proposed for Corresponding member, and Messrs. Robert Hagen, Dr. Bauer, Dr. Sharky, Dr. L. C. Lane, J. C. Pelton, E. Brooks, E. H. Holmes and W. K. Rowell, were proposed for resident membership.

*Donations to the Cabinet:* Specimens of Silicate of Alumina from Six Mile Cañon, Nevada, presented by Dr. Lanszweert; specimens of petrified wood from Sonoma county, by Dr. A. Kellogg. Dr. Kellogg also presented samples of the coffee berry, and offered seeds to any party who desired to experiment in the cultivation of the coffee shrub. The Doctor expressed doubt as to whether it could be successfully cultivated in this vicinity for tea, but it would make an ornamental evergreen bush for the garden.

The same gentleman called attention to the fact that trap-door spiders abound on Telegraph Hill. He exhibited a lump of earth from that locality, containing the burrow of one of these spiders, covered with a little trap-door hung on a hinge. The trap-door was about a quarter of an inch in diameter, and the burrow was somewhat smaller. The spider, though small, is of the same genus as the tarantula, and constructs his home on the same principle.

*Donations to the Library:*—Lea's Conchology, Volume XII, presented by the author. Congressional documents presented by Hon. John Conness.

Prof. Whitney read an interesting paper on the scientific character and services of Prof. Bache, late Superintendent of the Coast Survey. The Professor stated that the successor of Bache, Prof. Pierce, is an eminent mathematician and astronomer; and he regarded his appointment as a proof that the Coast Survey will hereafter be conducted with as much ability and thoroughness as heretofore. Prof. Pierce has long been connected with the Survey as adviser, and will ably continue the work so well begun by his lamented predecessor.

R. E. C. Stearns read a paper on the annual period of inactivity or sleep peculiar to snails, which will be found on the second page of this paper.

## BOTANY OF CALIFORNIA.

Prof. Bolander, Botanist to the State Geological Survey, made some remarks on the study of the botany of California, giving a list of those who have done most in the study of our indigenous vegetation. From 1792 to 1865, 73 years, 1,600 species were collected by 80 botanists. Of these 1,600 species, 74 per cent. are found in the collection of the State Geological Survey, and of these five per cent. are now to science, and eleven per cent. are new to California. The Professor criticized the publications and assertions of Prof. Wood, who lately visited this State, very severely. The Professor's criticisms were very humorous and sarcastic. He showed that the latter while here, could not possibly have done all he said he did in the way of identifying species during the time he was here, even if there had been so many species as he pretended to find. He quoted eminent authorities to refute Wood's statements, made in a letter to the *Bulletin* in June last, that the species are abundant here, and that our vegetable structures are very delicate. He called attention to the criticisms by Dr. Gray, in *Silliman's Journal of Science*, volume 20, page 129, and volume 32, page 129, in which different books, published by Prof. Wood, are exposed and condemned for ignorance of bot-

any and for violation of the rules of careful and honorable authorship.

## ALTERATIONS IN THE RAINFALL.

Dr. Henry Gibbons presented a diagram representing the average of the rainfall on every day from the first of October to the first of June, for seventeen years. This diagram showed a remarkable alternation. About the 8th and 21st of October, the 25th of November, from the 24th of December to the 21st of January, the 26th of February, the 27th of March, the 16th of April, and the 1st and 20th of May, the most rain fell, and the least about the 15th of October, the 1st of November, and the 3d of December, the 1st of January, the 15th of March, the 8th and 20th of April, and the 10th of May. He had also made a diagram to prove that the moon had no influence on the weather; but after he had it done, he found that the proof was just the other way. The table showed that heavy rains frequently came before the full moon, and almost invariably ceased as soon as the full moon appeared.

## CHEMICALLY PURE SILVER.

Mr. Gutzkow presented a sheet of chemically pure silver, three feet in diameter, about three ounces in weight, and as thin as fine paper. The color was beautifully white, and the texture like fine lace. This silver was obtained by mixing solutions of protosulphate of iron and sulphate of silver in a large dish, when the silver rose to the surface and there formed into a sheet. Successive sheets will rise with each stripping. This easy mode of obtaining chemically pure silver is of much practical value.

MR. HARDING, formerly of the Owyhee *Avalanche*, has furnished us a sample of chloride of silver from the Poorman's mine.

## Union Business College

—AND—

## Telegraph Institute,

(Merchants' Insurance Building)

No. 408 California Street.

THIS INSTITUTION is designed, to prepare Boys and Men for

Business Pursuits,

And to impart a thorough

Commercial Education.

It is conducted upon actual business principles. The student, upon entering the College is furnished with a

Capital in Cash and Merchandise,

Rents a place of business, opens an account with the bank, insures his goods with the insurance office of the College, and enters upon the area of business. He

Commences Speculation,

Carrying out all the details of trade—buying and selling goods, depositing in and checking from the bank, making and negotiating notes, drafts, bills of exchange, etc., recording the transactions and keeping the books in a regular and scientific manner. From this he advances to other capacities, until he finally takes his position in the

## Union Business College Bank,

A regularly established institution, complete in all its appointments, and having a circulation of

One Million in College Currency,

This course saves from four to six weeks' time in copying useless manuscripts.

## Penmanship.

PROF. F. SEREGNI, our Instructor in Penmanship, is well known to be a thorough and systematic teacher. And no College at present on this coast advertising to teach Penmanship, has ever taught the same by a regular, systematic plan, and we unhesitatingly declare, that for practical and systematic instruction in this branch, we challenge competition.

## Telegraphing.

The large and increasing demand for good Telegraph Operators has induced us to organize a separate department for thorough instructions in this branch, and we are now enabled to present advantages in this line equal to any that can be afforded on the continent. Several instruments are in operation, and others will be added as occasion requires. So great is the demand for operators, that no young man, well qualified, need be waiting a situation. A skillful and accomplished operator has charge of the departments, and will devote his special attention to the advancement of the students under his charge.

There is no vacation, and students can enter upon any business day during the year. The public are invited to call and examine the various departments. Sessions day and evening.

For Circulars and further information, address JAMES VINSONHALER, Principal.

**Builders' Insurance Company—**  
OFFICE IN THE BUILDING OF THE  
CALIFORNIA SAVINGS BANK, California  
street, one door from Sansome street.  
FIRE AND MARINE INSURANCE. 10v149pqr

## A Paying Newspaper for Sale.

A one-half interest in one of the best Country Papers in the State, is offered for sale on desirable terms. The Journal is the oldest in the country, is situated at the County Seat, and surrounded by one of the most prosperous and promising Quartz and Gravel Mining Districts in the State. Inquire at the office of the *Mining and Scientific Press*, or address DEWEY & VAUGHN, Mountain Messenger office, Downsville, Sierra County, Cal. 7v141f

## NELSON &amp; DOBLE,

AGENTS FOR

## THOMAS FIRTH &amp; SONS' CAST STEEL, FILES, etc.

SHEAR, SPRING, GERMAN, PLOW, BLISTER AND TOE OAK STEEL, MANUFACTURERS OF Mill Picks, Sledges, Hammers, Picks, Stone Cutters', Blacksmiths' and Horse-Shoers' Tools, 319 and 321 Pine street, Between Montgomery and Sansome, San Francisco. 10v141g

## JACOB SHEW,

## Pioneer Photographer.

612 Clay street, north Side, four doors above Montgomery. (Late 315 Montgomery street.) Takes all kinds of Photographs in the best style of the Art. He would invite special attention to the new "Cabinet Photographs," which he is taking to perfection. 10v141f

## Pratt's Abolition Oil.

FOR ABOLISHING PAIN—THE BEST REMEDY IN existence for Rheumatism, Neuralgia, Paralysis, Headache, Toothache, Sore Throat, Diphtheria, Weak, Swollen and Stiff Joints, Contracted Cords and Muscles, Gout, Colic, Diarrhea, Cholera, Pains in the Breast, Lame Back, and all aches and pains. It is the poor man's friend, and the best family physician. Full directions accompany each bottle. Price 50 cents and \$1 per bottle. For sale by all dealers in medicines. Sole Proprietors, A. McBOYLE & CO., Druggists and Chemists, 514 Sacramento street, opposite What Cheer House, San Francisco. 10v141y

## STEAM HOISTING APPARATUS.

Embracing ALL SIZES of Steamboat Shafts, Cranks, Piston and Connecting Rods, Car and Locomotive Axles and Frames.

## —ALSO—

## HAMMERED IRON

Of every description and size.

Orders addressed to PACIFIC ROLLING MILL and FORGE CO., Post Office, San Francisco, Cal., will receive prompt attention.

The highest price paid for Scrap Iron. 9v143m5p

## A. S. Hallidie &amp; Co.,

MANUFACTURERS OF

## FLAT &amp; ROUND WIRE ROPE,

For Mining, Shipping, Ferry,

AND GENERAL PURPOSES.

Office—412 Clay street. Works—North Beach

SAN FRANCISCO.

NOTICE.—THE FIRST COST OF WIRE ROPE IS MUCH less than that of any other kind of rope of equal strength, and it is four times as durable. Wire Rope does not stretch or shrink by atmospheric changes; it has but one-fifth the bulk of Hempen Rope; is spliced and repaired in the same manner.

The attention of Mining Companies is particularly called to our Flat and Round Hoisting Ropes, which have been in use for a number of years by the leading mines on this coast, and of whom we refer these lines increased as to the great advantages over any other kind of rope; effecting an immense saving in expenditure for ropes, fuel, wear and tear of machinery, stoppage of works, etc., besides increasing safety of life.

Shipping Companies, in erecting Hoisting Works, should be sure and have their drums and pulleys of sufficient size, whether for wire or hemp rope.

We manufacture of all sizes, and in any length—

Round Wire Rope—Iron or Steel, for Hoisting.

Flat Wire Rope—

Soft Steel Wire Rope—For Derrick Fall Ropes—very strong and durable—one third the weight of hemp of equal strength, (saving in freight for remote localities). Suitable sheaves and blocks furnished when required.

Galvanized, or Ungalvanized, Round Wire Ropes—For Ships' Tugboats, Derrick Gigs, Ferry Ropes, and all standing purposes.

Steel Ferry Ropes—For wide streams. Ferry Blocks supplied.

Iron and Copper Wire Cord— $\frac{1}{2}$  to  $\frac{3}{4}$  inch diameter, for hanging window shades; Signal Cord; Sash Pulleys on hand.

Comparative Weight, Sizes and Strength of Iron Wire Rope, Steel Wire Rope, Hemp Rope, and Chain.

Iron Wire Rope.	Steel Wire Rope.	Hemp Rope.	Chain.	Equivalent Strength.

Pamphlets containing data, with prices unexcelled, forwarded free, by mail or express, on application to manufacturers. 25v136m5p

Established in 1849--Corner First and Mission streets, San Francisco.

HAVING INCREASED OUR FACILITIES IN EVERY DEPARTMENT, WE ARE NOW prepared at the shortest notice and at the most reasonable rates, to furnish all kinds and description of Machinery, including Steam Engines, Quartz Mills, Mining Pumps of all kinds, Hoisting Gear, Gas Work, Laundry Machinery, Architectural and Ornamental Castings, Sugar Mills, Saw and Flour Mills, Water Wheels of all kinds, Hydraulic, Hay, Rag, screw and Drop Presses, Coining Machinery, Pile Drivers, Bark and Malt Mills, and all kinds of Castings.

**ENGINES.**—Marine Engines, Oscillating and Beam; Stern and Slide Wheel Boats, Locomotives, Stationary Engines, Horizontal, Upright, Oscillating and Beam, from six to fifty inches diameter. Also, Scott & Eckart's Adjustable Cut-off Regulator—best in use; W. R. Eckart's Balance Valve for Stationary Engines; Woodward's Patent Steam Pump and Fire Engine.

**BOILERS.** Locomotive, Flat, Tubular, Upright, Cylinder and Cornish, and every variety of Boiler Work. All sizes of tubes and pipes for pumps.

**PUMPS.**—The Excelsior double-acting Force Pumps are manufactured by us. These very superior Pumps are warranted the best, and are fast replacing all other Force Pumps.

**AMALGAMATING MACHINERY.**—Wheeler & Randall's Improved Tractory Curve Pan, Zenith Wheeler's Improved Flat Bottom Pan, Beldin's Pan, Yeatch's Tubs, Prater's concentrators, Wadley's pans, Beers' pan, German Barrels, Arasura Gearing, Chile Mills, Settlers of all descriptions, Retorts of all sizes and shapes, for Silver and Gold, Portable Stamp Mills, Straight Batteries, for wood or iron frames, Dry Crushing Batteries, or machines with the latest improvements, every variety of Stamps, Mortars, Cams, Pans and Tubs. **BLAKE'S PATENT QUARTZ CRUSHERS**, of all sizes.

**OIL BORING TOOLS AND MACHINERY.**—Of the latest and most approved construction, made from drawings lately made by Prof. Blake at the oil wells in Pennsylvania. We have the facilities for working gold and silver quartz and other ores, to test their value, by the hundred weight or ton.

Russia Iron Screens, of all degrees of fineness and of all qualities of iron. All work done in the best manner at the lowest cash prices.

### AUTUMN TINTS OF AMERICAN WOODS.

Professor Agassiz thus speaks of the gorgeous coloring assumed by American trees in autumn: "In attempting to determine the cause of these changes, it ought not to be forgotten that they occur locally, and also make their appearance on particular trees much earlier than upon others; so early, indeed, as to show clearly the fallacy of the prevalent idea that they are caused by frost. The temperature remains ten or fifteen degrees above the freezing point for a month and more after a good many of our trees have assumed their bright autumnal hues. The process is no doubt akin to that of ripening fruits, especially in such fleshy fruits as turn from green to yellow, purple or red, like apples, peaches, plums, cherries, and others. The change in color coincides with changes in the constitutive chemical elements of the plant.

COAL OIL, plentifully applied, will kill chicken lice—and the chickens too. It was tried the other day in Oakland.

**TOWNE & BACON,**

"A NEW CURE FOR CONSUMPTION."—*Le Courrier Medical* contains a communication from Mons. Baleguer, describing a new oil, which he professes to have discovered, and which he declares to be endowed with a "marvellous power for traversing animal membranes." He says: "If a few drops are poured into the palm of the hand, and the palm rubbed with a finger, the oil is soon seen oozing through the back of the hand. The same experiment tried on the fore-arm produces the same result. When the oil is saturated with a foreign substance, it loses none of this remarkable power for penetration, and can therefore serve as a vehicle par excellence for the administration of drugs. The experiment has been tried with copaiba and with iodine, and with very satisfactory results. When the oil, saturated with iodine, was rubbed upon the palm of the hand, and the back of the hand wiped with a piece of muslin, the muslin was tinged violet." Mons. Baleguer believes that the efficacy of iodine, if administered in this oil, would be so immensely increased, that a rational hope might be entertained of its power to arrest tubercularization in the lungs. The popular prejudice among the ignorant rather takes to "oils." "Wizard oil" and "Electric oil" have had their day. Now comes another wonder, apparently of the same genus. The first point that suggests itself in this communication, is the fact that Mons. Baleguer conceals the name of this wonderful oil. This, in itself, savors of quackery; for among scientific men—at least those who devote themselves to the healing art—there are no secrets. But there are other points connected with the remedial virtues of iodine, as applied locally, which, as this is not a medical journal, we refrain from referring to.

INGENIOUS UTILIZATION OF FORCE.—Mons. Robert Houdin, the ex-conjuror, has, at his country house, a clock which is kept wound up by an ingenious arrangement of his own devising. He has made use of the force furnished by the constant opening and shutting of his door, to put in motion mechanism which winds up the weight. Several other curious contrivances about the house give proof of his remarkable ingenuity. He began life as a clockmaker.

To Owners of Copper Mines and Smelting Works.

A PERSON OF LARGE EXPERIENCE IN COPPER Smelting, both in the Atlantic States and California, wishes a situation as Superintendent of an establishment for Smelting Copper. Address "W," care of Mining and Scientific Press. 5v14f

**B. F. HOWLAND,**

The rooms of the House are well furnished, large and airy, are let by the month, week or day, and are kept in superb order. There is a Restaurant attached for ladies and families, where persons can board for one-half the price required to pay at hotels. 1v13m  
SANBORN & CO.

## THE PACIFIC IRON WORKS,

First & Fremont Sts., between Mission & Howard, San Francisco.

The proprietors of the above Works invite the attention of all parties interested to their greatly improved and unequalled facilities for manufacturing Steam Engines and Boilers, both Marine and Stationary, of any required size and pattern, Quartz Mills, Amalgamating, Pumping and Hoisting Machinery of the most approved construction. Flour, Saw, and Sugar Mills, Water Wheels, &c., &c. Our pattern list is most complete and extensive, embracing the late improvements in all classes of machinery adapted to use on this coast. We would call especial attention to the fact that we have secured the exclusive right of manufacture for the Pacific Coast of the celebrated Greene Engine, conceded to be the most economical and perfect working Engine now in use. We are also exclusive manufacturers of the celebrated

Brynn Battery, Varney's Amalgamators and Separators, Ryerson's Superheated Steam Amalgamators and Rotary Crushers, Stone Breakers, &c. Orders respectfully Solicited.

GODDARD & COMPANY.

## ROWLAND, WALKER & CO., GROCERS,

Nos. 516 and 518 Washington street,

Are offering a complete assortment of GROCERIES at the LOWEST RATES. Quality guaranteed.

Goods delivered at any point within the city limits. 2v13-1y

## NEW YORK PRICES.

**C. E. COLLINS,**

Imported directly from the Manufacturers.  
The American Company are now making  
VERY FINE WATCHES FOR LADIES.  
A large assortment of Gold Chains and Jewelry. 2v10-6m

## NEW YORK PRICES.

## REMINGTON'S ARMORY.

Agency, 310 Washington st., San Francisco.  
PRICES REDUCED!

These arms have been preferred by the United States Government, and stand unequalled by any in the world. Revolvers, Army, Navy, Belt and Pocket, Double and Single Action; Repeaters, with copper ammunition; Police Revolvers, a new model, navy size ball, 4½ to 6 inch barrel; Rifle Cases—an entirely new Arm—having a range and accuracy equal to a rifle, and a most perfect Camo. All the new models for sale very low. 12v13f  
ALBERT E. CRANE.

Economy in Advertising.—The Mining and Scientific Press is the best and most economical mining advertising medium in this city. Our terms are less than one-half the rates now charged by daily newspapers, and the mining community are beginning to appreciate our reasonable rates of advertising. The Press contains, proportionally, a larger amount of mining advertising than any other paper on the Pacific coast. Its character renders it the proper journal for the concentration of mining patronage.

## NATIONAL Insurance Company!

OF SAN FRANCISCO.

Which are the most dresy Hat ever introduced on the Pacific Coast. 8v14

Call and see them.

## Rheumatism!!

Still Another Witness!

LATHROP, Cal., Sept. 19, 1866.  
(White Oak Township, El Dorado Co.)  
This is to certify, that I have, for over thirty-six years, been afflicted with Chronic and Inflammatory Rheumatism, and the sufferings and tortures I endured in consequence cannot be told. I have, at an expense of thousands of dollars, employed many physicians, both in this country and in Europe (where I was born and resided many years), among which were several eminent professors of medicine, and I experienced no benefit from their treatment, more than at times a slight and temporary relief.  
About two years ago I was induced by some persons who had been cured by it to use Richard's Remedy for Rheumatism. It is enough to say that I was almost immediately relieved, and that I have not suffered with it since. I keep the medicine on hand, and, on the first approach of any returning symptoms, I take a few doses, which invariably put it to flight. I therefore cordially recommend it to be afflicted as an untailing remedy for Rheumatism.  
FREDK PABER.

RICHARD'S REMEDY is for sale by  
**H. BOWMAN,** Druggist, Sacramento,  
And by Druggists generally. 2v13

Engraved to Order.—Persons who desire to illustrate their individual establishments or business, should give us their orders for Engraving and Printing, and we will guarantee good work and reasonable prices.

## METALLURGICAL WORKS,

—AND—

Practical Mining School,

Bryant Street, Between Third and Fourth, SAN FRANCISCO.

THE Proprietors are at all times prepared to work or test Ores sent to this establishment—either in large or small quantities—by such process as may be found best adapted to their chemical character, after a careful analysis has been made. Test lots of Ore adapted to the smelting process attended to. Sulphuret, pyrites, and the so-called "rebellious ores," are having especial attention paid to their successful treatment. Assaying in the humid and dry way. Also, refining by cupellation, done at moderate rates.

## PRACTICAL MINING SCHOOL.

The proprietors—encouraged by numerous applications from gentlemen desirous of pursuing the study of practical metallurgy—have concluded to admit parties on reasonable terms. Having in their Mill all the necessary appliances for crushing, roasting, amalgamating, smelting, refining and assaying, as also a well extended Laboratory for the analysis of Ores and Minerals, a good opportunity is here offered to acquire a sound practical knowledge of the business.

S. P. KIMBALL, J. R. MURPHY. 10v10

## MOSHEIMER'S

## Metallurgic Works

And Practical School for Assaying and Metallurgy.

THE UNDERSIGNED HAS REOPENED METALLURGIC Works, and is prepared to reduce any kind of Ores, by Smelting, Amalgamating, or other processes, that the nature of the ore may require.

Practical instructions given in Assaying, all branches of Metallurgy and Technology.

Furnishes Plans and Estimates for the erection of Quartz Mills, Smelting and other Reduction Works.

Having carefully studied the science of Concentrating Ores, I can offer better concentrating machinery than any in use in California, and especially such as will save the fine or floating gold and sniphures.

## CONSULTATION OFFICE:

328 Montgomery street, San Francisco.

J. MOSHEIMER,

Engineer and Metallurgist. 25v13-3m

## Pacific Mail Steamship Co's

## THROUGH LINE TO NEW YORK,

Carrying the United States Mail.

LEAVE FOLSOM STREET WHARF, AT 11

o'clock A. M. of the following dates, for PANAMA, connecting via Panama Railroad, with one of the Company's splendid steamers from ASPINWALL for NEW YORK.

On the 10th, 18th and 30th of each month that has 30 days.

On the 10th, 19th and 30th of each month that has 31 days.

When the 10th, 19th and 30th fall on Sunday, they will leave on Saturday preceding; when the 18th falls on Sunday, they will leave on Monday following.

Steamer leaving San Francisco on the 10th touches at Manzanillo. All touch at Acapulco.

Departures of 18th or 19th connect with French Transatlantic Co's steamer for St. Nazaire, and English steamer for South America.

Departure of 10th connects with English steamer for Southampton, and P. R. R. Co's steamer for Central America.

Departure of the 30th connects with English steamer for Panama, the port of the new mines.

The following Steamships will be dispatched on dates as given below:

March 9th—SACRAMENTO.....Capt. J. M. Cavarly, Connecting with HENRY CHANCEY, Capt. Oray.

March 19th—CONSTITUTION.....Capt. W. F. Lapidge, Connecting with QUINN, Capt. Maury.

March 30th—GOLDEN AGE.....Capt. Jas. T. Watkins, Connecting with the RISING STAR, Capt. Furber.

Cabin passengers berthed through. Baggage checked through—100 pounds allowed each adult.

An experienced Surgeon on board. Medicine and attendance free.

These steamers will positively sail at 11 o'clock. Passengers are requested to have their baggage on board before 10 o'clock.

Through Tickets for Liverpool by the Inman Line, can be obtained at office P. M. S. S. Co., San Francisco.

For Merchandise and Freight apply to Messrs. WELLS, FARCO &amp; CO.

The splendid steamship COLORADO will be dispatched on WEDNESDAY, April 3, 1897, for Hongkong, via Kanagawa, carrying passengers, mails and freight.

For passage and all other information, apply at the Pacific Mail Steamship Co's office, corner of Sacramento and Leidesdorff streets.

OLIVER ELDRIDGE, Agent.

## City College Laboratories,

Southeast Cor. Stockton and Geary sts.

Practical and Analytical Chemistry and Metallurgy.

THOMAS PRICE,  
Professor of Chemistry,  
(Formerly of the Normal College, Swansea.)

WILL GIVE PRACTICAL INSTRUCTIONS IN QUALI-  
tative and Quantitative Analysis and Assaying. The  
course qualifies students for the application of Chemistry  
to METALLURGY, MANUFACTURING ARTS, and MINING  
PURPOSES.

PHARMACEUTICAL and TECHNICAL CHEMISTRY,  
such as is required by Medical and Pharmaceutical Stu-  
dents, will be taught to such students as may require it.

Course of General Chemistry.  
Evening Lectures will be delivered every Tuesday,  
at half past seven o'clock, P. M., in the Philosophical Hall of  
the College, without extra charge to the students in the  
institution.

On and after the 14th of February, the Laboratories will  
be open every day, except Sundays, from 8 A. M. to 5 P. M.  
For further particulars, address

REV. P. V. VEEDER,  
Principal of the City College.  
Or at 406 California Street.

- II. Diagram, Description of Diagram and Bound-  
aries, and Notice.
- III. Register's Order for Publication—with No-  
tice.
- IV. Deposition that Notice has been Posted.
- V. Application for Survey Etc.

Prices.—Single blanks, 10 cents; 75 cts per doz-  
en; \$4 per hundred—postage paid.

Pamphlet containing the Law and the Instruc-  
tions of the General Land Commissioner, post  
paid, 25 cts. Address DEWEY & CO.,  
Mining and Scientific Press, San Francisco.

Air Pump for Sale.—One of Tate's Double-Action  
Air Pumps, in prime order, can be had at a bargain, by  
applying soon at this office, or to JOHN ROACH, mathemat-  
ical instrument maker, 622 Montgomery street. 2v13-9p

## New Mining Advertisements.

Chilpancingo Mining Company—District of Ores,

Sonora, Mexico.

Notice.—There are delinquent, upon the following de-  
scribed stock, on account of assessment levied on the  
thirtieth day of January, 1897, the several amounts set  
opposite the names of the respective shareholders as fol-  
lows:

Names.	No. Certificate.	No. Shares.	Amount.
Gautier, F.	10	25	\$150 10
Mosheimer, Jos.	58	25	125 00
Mosheimer, Jos.	57	25	130 10

And in accordance with law, and an order of the Board  
of Trustees, made on the thirtieth (30th) day of January, 1897,  
so many shares of each parcel of said stock as may be  
necessary, will be sold at public auction, by J. Middleton &  
Son, 404 Montgomery street, San Francisco, Cal., on Mon-  
day, the twenty-fifth day of March, 1897, at the hour of  
12 o'clock, M., of said day, to pay said delinquent assess-  
ment thereon, together with costs of advertising and  
expenses of sale.

JOHN F. LOHSE, Secretary.

Office, 318 California street, San Francisco, Cal. m9

## Great Central Mining Company.—Location of

Works: Yuma County, Arizona Territory.

Notice is hereby given, that at a meeting of the Board of  
Trustees of said Company, held on the first (1st) day  
of March, 1897, an assessment of one (\$1) dollar per share  
was levied upon the capital stock of said Company, pay-  
able immediately, in United States gold and silver coin,  
to the Secretary, at the office of the Company, No. 302 Mont-  
gomery street, San Francisco.

Any stock upon which said assessment shall remain un-  
paid on the eighth day of April, 1897, shall be deemed  
delinquent, and will be duly advertised for sale at public  
auction, and unless payment shall be made before, will be  
sold on Tuesday, the thirtieth day of April, 1897, to pay  
the delinquent assessment, together with costs of advertis-  
ing and expenses of sale. By order of the Board of Trust-  
ees.

O. D. SQUIRE, Secretary. m9

## Hanscom Copper Mining Company. Location:

Low Divide District, Del Norte County, California.

Notice is hereby given, that at a meeting of the Board of  
Trustees of said Company, held on the fourth day of  
March, 1897, an assessment of ten cents (10c) per share  
was levied upon the capital stock of said Company, pay-  
able immediately, in United States gold and silver coin, to the  
Secretary, 609 Market street, San Francisco, Cal.

Any stock upon which said assessment shall remain un-  
paid on the fourth day of April, 1897, shall be deemed deli-  
quent, and will be duly advertised for sale at public auction,  
and unless payment shall be made before, will be sold  
on the twenty-second day of April, 1897, to pay the delin-  
quent assessment, together with costs of advertising and  
expenses of sale. By order of the Board of Trust-  
ees.

S. S. SWEET, Secretary. m9

## Office, No. 609 Market street, San Francisco, Cal.

## Keystone Mining Company. Location of Works

Copperopolis, Calaveras County, California.

Notice is hereby given, that at a meeting of the Board of  
Trustees of said Company, held on the twentieth day of  
February, 1897, an assessment of ten dollars (\$10) per share  
was levied upon the capital stock of said Company, pay-  
able immediately in United States gold coin, to the Secre-  
tary, at his office, No. 440 California street, San Francisco,  
California.

Any stock upon which said assessment shall remain un-  
paid on Monday, the twenty-ninth day of April, 1897, shall  
be deemed delinquent, and will be duly advertised for sale  
at public auction, and unless payment shall be made be-  
fore, will be sold on Monday, the twentieth day of May,  
1897, to pay the delinquent assessment, together with costs  
of advertising and expenses of sale. By order of the Board  
of Trustees.

O. P. SUTTON, Secretary. m9

## STOCK CERTIFICATES, STOCK TRANSFER JOURNALS, STOCK LEDGERS, ASSESSMENT RECEIPTS,

And all other Blanks, Blank Books, etc., required by Mining and other Corporations, kept on hand or printed to order on short notice, at moderate prices, at the office of the Mining and Scientific Press.

## Diamond Copper Mining Company, Location: Rockland District, Del Norte County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the fourth day of February, 1897, an assessment of two dollars (\$2) per share was levied upon the capital stock of said Company, payable immediately in United States gold coin, to the Secretary, at the office of the Company, Room No. 31 Montgomery Block, San Francisco, or to ROBT. B. RANDALL, the Company's Superintendent, at Crescent City, Del Norte County, California.

Any stock upon which said assessment shall remain unpaid on Saturday, the ninth day of March, 1897, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the first day of April, 1897, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

Office, Room No. 33 Montgomery Block, corner of Montgomery and Washington streets, San Francisco, Cal. feb9

## Emilia Mining Company, State of Guerrero, Mexico.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twentieth day of February, 1897, an assessment of seventy-five cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, Room No. 1 Crim House, No. 523 Kearny street, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on the twenty-second day of March, 1897, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the eighth day of April, 1897, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

MAX. BURKHARDT, Secretary.  
Office, Room No. 1 Crim House, No. 523 Kearny street, San Francisco, Cal. feb23

N. B.—The above assessment is levied in place of the assessment levied October 26th, 1895, which was revoked at a meeting of the Board of Trustees, held February 20th, 1897. All stockholders who have paid on the said assessment levied October 26th, 1895, will be credited the amount so paid on the assessment of February 20th, 1897. By order of the Board of Trustees.

MAX. BURKHARDT, Secretary.

## Even Consolidated Copper Mining Company, Location of Works: Court Hill District, near Black's Ferry, Del Norte County, California.

Notice.—There are delinquent, upon the following described stock, on account of assessment levied on the fourteenth day of January, 1897, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	Certificate.	Number of Shares.	Amount.
Wm. M. Rider	61	12	\$4.00

And in accordance with law, and an order of the Board of Trustees, made on the fourteenth day of January, 1897, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, by Messrs. Olney & Co., at No. 418 Montgomery street, San Francisco, Cal. on the thirteenth day of March, 1897, at the hour of 2 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

R. S. CLYDE, Secretary.  
Office of Company, No. 532 Merchant street, Room No. 3, San Francisco, California. feb23

## George Washington Gold and Silver Mining Company, Location of Works: Silver Mountain District, Alpine County, Cal.

Assessment No. 17.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the fifth day of February, 1897, an assessment of three dollars and fifty cents (\$3.50) per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary, at the office of the Company, only.

Any stock upon which said assessment shall remain unpaid on the ninth (9th) day of March, 1897, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twenty-fifth day of March, 1897, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

A. G. WOOD, Secretary.  
Office, 338 Montgomery street, San Francisco. feb9

## Hope Gravel Mining Company, Location of Works and Property: Grass Valley, Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-fifth day of February, 1897, an assessment (No. 13) of one dollar (\$1) per share was levied upon the capital stock of said Company, payable immediately, in gold coin of the United States, to the Secretary, at the office of the Company, No. 529 Clay street, San Francisco.

Any stock upon which said assessment shall remain unpaid on Wednesday, the third day of April, 1897, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twenty-second day of April, 1897, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

DAVID WILDER, Secretary.  
Office, No. 529 Clay street, corner of Ledicesford street, San Francisco, Cal. feb25

## Kern River Gold and Silver Mining Company, Cove District, Kern County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment levied on the third day of January, 1897, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
A. Staples	57	30	\$30.00
P. H. Staples	52	30	30.00

And in accordance with law, and an order of the Board of Trustees, made on the third day of January, 1897, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the Company's office, No. 302 Montgomery street, San Francisco, Cal., on the twelfth day of March, 1897, at the hour of 12 o'clock M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

M. G. ELMORE, Secretary.  
Office, No. 302 Montgomery street, San Francisco. feb12

## Mount Tembo Silver Mining Company, Location of Works: Cortez District, Lander County, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the fifteenth day of February, 1897, an assessment of one dollar and fifty cents (\$1.50) per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, 331 Montgomery street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the twenty-first (21st) day of March, 1897, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Thursday, the eleventh day of April, 1897, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

R. N. VAN BRUNT, Secretary.  
Office, 331 Montgomery street, San Francisco. feb16

## Nuestra Señora de Guadalupe Silver Mining Company, Tayoltita District, Durango, Mexico.

The Annual general Meeting of said Company, for the election of Trustees for the ensuing year, will be held on MONDAY, the fourth day of March, 1897, at 8 o'clock P. M., at the office, No. 210 Post street, San Francisco. Proxies must be in writing, and ten cents stamp affixed.

R. J. PFEIFFER, Secretary.

## North San Francisco Homestead and Railroad Association, at the City and County of San Francisco, Cal.

Notice.—There are delinquent, upon the following described stock, on account of assessment levied on the eleventh day of January, 1897, the several amounts set opposite the names of the respective shareholders as follows:

And in accordance with law, and an order of the Board of Trustees, made on the eleventh day of January, 1897, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the salesrooms of Maurice Dore & Co., No. 327 Montgomery street, San Francisco, Cal., on Friday, the fifteenth day of March, 1897, at the hour of 12 o'clock M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

GEO. W. KINNEY, Secretary.  
Office, No. 418 California street, Room No. 5, third floor, San Francisco. feb12

## Salamanca Gold and Silver Mining Company, Location of Works: Leon's Ranch District, Calaveras County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the eleventh day of February, 1897, an assessment (No. 7) of fifty cents per share was levied upon the assessable capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, E. J. Pfeiffer, at the office, No. 210 Post street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the fifteenth (15th) day of March, 1897, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Wednesday, the tenth day of April, 1897, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

E. J. PFEIFFER, Secretary.  
Office, No. 210 Post street, San Francisco, Cal. feb16

## San Marcel Silver Mining Company, Location of Works: San Marcel District of Hermosillo, State of Sonora, Mexico.

Notice is hereby given, that the Annual Meeting of the shareholders of the above named Company, will be held on TUESDAY, the eighteenth day of March, 1897, at 7 1/2 o'clock P. M., of that day, at the office of the Company, No. 331 Montgomery street, San Francisco, for the election of Trustees to serve the ensuing year, and for the transaction of other business.

R. N. VAN BRUNT, Secretary.  
Office, 331 Montgomery street, San Francisco. feb12

## Siskiyou Mining Company, Location of Works: Middle Fork of Humboldt Creek, in the County of Siskiyou, State of California.

Notice.—There are delinquent upon the following described stock, on account of assessment levied on the tenth day of

## Machinery.

# STEWART'S CELEBRATED HINGED Grinder and Amalgamator.

## Is the Cheapest and Quickest Pan

Now used. It is flat-bottomed, loses far less power in throwing the pulp, and circulates the same under the muller to better advantage than any other Pan in use, while the steam owing to the thinness of the cone, has a more direct effect in heating the pulp. E is the muller plate; F the Grinding Shoe, attached by an adjustable hinge joint in the middle of the same—the bottom wearing down even with the disc.

Mr. J. H. STEWART, the inventor, has had ten years of experience in mechanical operations, and may be addressed at San Francisco, or called on at the Miners' Foundry, First street, where his Pan is manufactured, and is to be seen at any time in operation. 3v11r

## HUNTER'S IMPROVED CONCENTRATOR.

THE INVENTOR OF THE ABOVE RECENTLY IMPROVED Machine, is now prepared to take contracts for concentrating gold or silver ore on shares, receiving a certain per cent. of the sulphurets as may be agreed upon; and will guarantee twenty per cent. more sulphurets than from any rocker or concentrator built on the Pacific coast, saving at least ninety percent. of the sulphurets contained in the ore. The sulphurets, if desired for shipping, will contain less than one per cent. of sand.

Persons who have sulphureted ores will do well to have their sulphurets saved; as the many failures in mining can often be attributed to the waste of sulphurets. For particulars, address

32—One of these Machines can be seen in operation at the Union Foundry, in this city, up stairs.

ANDREW HUNTER, Inventor, 22v13-3m San Francisco.

## VARNEY'S PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular low between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Settlers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the **PACIFIC FOUNDRY,** San Francisco, 1v1

## Steam Pumps,

FOR DRAINING MINES OR ELEVATING WATER TO ANY HEIGHT.

**PICKERING'S GOVERNORS**

For Steam Engines.

**Giffard's Injectors,**

For Feeding Boilers.

**STODDART'S IRON WORKS,**

Beale Street, San Francisco, 23v12 3m

## TIME & LABOR SAVED —BY USING— STANDARD SOAP COMPANY'S WASHING POWDER.

THIS POWDER IS SUPERIOR TO ALL OTHER PREPARATIONS for washing and cleansing. It is made of pure material, and contains nothing that will injure the finest fabric. Equally as good for use in hard as soft water. One pound will make three gallons of beautiful soft soap. Put up in wrappers of 1 lb. each, and in wooden boxes of 10-lb. bulk. Ask your grocer for a package, and test its virtue. Manufactured at **207 Commercial street,** San Francisco. 15v12q

## Brown's Filtering Heater!

FOR PREVENTING INCrustation IN STEAM BOILERS. purifies water from lime or any other impurity, saves fuel, saves the boiler, prevents explosions, and protects life and property. The cost of the Filter is soon saved in fuel and boiler repairs alone.

One is in operation at the San Francisco Foundry, Fremont street, where rights can be procured, or all needed information, on application, in person or by letter, to 6v14-1y **AUSTIN A. WELLS, Agent.**

## Brodie's Patented Improvements

## FOR THE TREATMENT OF Gold and Silver Ores.

**BRODIE'S PATENTED IMPROVED QUARTZ CRUSHER.** The attention of all interested in Mining is respectfully called to this Improved Machine for Breaking or Spalling Quartz, or other Rock, possessing as it does, simplicity of action and lightness of construction, so far as is compatible with strength and durability. In consequence of these advantages, the advertisers are enabled to offer these machines to the public at the following low terms: No. 1—Or 8 inch Crusher, capable of reducing from three to four tons of quartz per hour, no piece being larger than a walnut—price.....\$600 No. 2—Or 15 inch Crusher, capable of similarly putting through five to six tons per hour.....\$850 No. 3—Or 18 inch Crusher, will in a similar manner crush from seven to eight tons per hour.....1,200

**EXPLANATION OF THE ABOVE ENGRAVING.** The frame is made of cast iron, bound with heavy wrought iron bands, making it very strong, and at the same time light and portable. The crusher is bolted to a wood frame of sufficient height to clear the fly-wheel, and allow the crushed quartz to pass off. The dotted lines show the movable and stationary jaws. Letter A represents the eccentric shaft by which the power is applied direct to the movable jaw. B represents the movable jaw, and C the fixed jaw. D represents the link or radius bar. E represents the bolts for regulating the opening. F, which can be regulated at pleasure, so as to graduate the size to which it is intended the quartz shall be crushed. G represents the feed opening, by which the size of the machine is designated.

The arrow on the fly-wheel shows the direction to drive the eccentric, which, in combination with the link, O, gives the movable jaw, B, a forward and downward motion at the same time, and which makes the hardest rock yield and separate into fragments of any desired size.

The above Crushers have been recently erected and are now successfully employed at Bear Valley, Mariposa county, Rawhide Ranch, Tuolumne county, Excelsior Mine, Lake District, Nevada county, and can be seen in operation at the Fulton Foundry, First street, San Francisco.

The following testimonial respecting the effectiveness of this Crusher, has been received from the Superintendent of the "Rawhide Ranch" Mine, in Tuolumne county:

**RAWHIDE RANCH, Tuolumne Co., Sept. 23, 1866.** JAMES BRODIE, Esq., San Francisco—My Dear Sir: It gives me pleasure to inform you that I have for the past three months had one of your largest sized Rock Crushers in use, at the Rawhide Ranch Mining Company's Mill, which is entirely met my expectations; and I have no hesitation in recommending it to all who are in need of a machine for rapidly, cheaply and properly preparing quartz for the stamps. Yours truly, R. P. JOHNSON, Supt. Rawhide Ranch Quartz Mill.

**BRODIE'S PATENT IMPROVED GERMAN AMALGAMATING BARREL.**—This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, in 1864. Further particulars will be afforded on application to the subscribers.

Those infringing the patent rights to the above Improved Barrel, are hereby informed that on and after the 1st November, 1866, the royalty will be charged for using the same will be raised to the sum of \$100 per Barrel.

A diagram, with explanations of this machine, will be found in the "Mining and Scientific Press," of September 29th, 1866.

**BRODIE'S PATENT WIND-BLAST SEPARATOR FOR DRY CRUSHING.**—This Dry Crusher has been found the most economical and effective mode of crushing ores in Mexico, California and Nevada. Diagrams and explanations afforded on application to the subscribers.

A drawing and full description of this machine will be found in the Mining and Scientific Press, of Sept. 22d, 1866.

**BRODIE & RADCLIFFE,** Express Building, 402 Montgomery street, San Francisco.

12v13fr

## BRUCKNER'S Mechanical Roasting Furnace

AWARDED A

**PREMIUM SILVER MEDAL**

—BY THE—

**The Mechanics' Institute.**

Patented December, 1866.

**THESE FURNACES ARE NOW MANUFACTURED AT** an improved mode of construction, which **GREATLY SIMPLIFIES THEIR OPERATION,** and afford a much larger oxidizing surface to the action of heat and atmosphere.

The weight of a Furnace nine feet long by four feet in diameter does not exceed one ton.

## THE IMPROVED FURNACE

May be seen in operation, for desulphurizing or roasting and chloridizing, at Central Mill, Virginia City, Nevada.

Parties wishing to erect such Furnaces, are requested to leave their orders with

19v12 T. KALLENBERG, 416 Market street, San Francisco.

## Notice to Miners,

**Well-Borers and Water Companies.**

**M. PRAG** IS NOW PREPARED TO MANUFACTURE M. Hydraulic and Artesian Well Pipes in the best workmanlike manner, at the lowest market price. I have made large additions to my stock of machinery for that branch of business, I am prepared to fill all orders with dispatch, and guarantee entire satisfaction. I also manufacture the M. Stoves, of the latest improved pattern, for vessels of all classes. Also, Ship Plumbing done.

M. PRAG, 8v13-1y Stove Store, No. 125 Clay street, below Davis.

## BLAKE'S QUARTZ BREAKER! PRICES REDUCED!

MACHINES OF ALL SIZES FOR SALE

—BY—

**WM. P. BLAKE,**

Corner First and Mission streets, or Box 2,077 3v13r SAN FRANCISCO.

## Mechanical Drawings.

Persons wishing Mechanical Drawings can obtain the services of competent draughtsmen, by applying to this office.

## LEFFEL'S American Double Turbine

**THESE WHEELS, UNEQUALED AND UNRIVALED** IN the United States or the world, have been fully tested on this coast, more than forty being in use at this date in California and Oregon, driving all kinds of machinery, Saw Mills, Flour Mills, Quartz Mills, etc., etc., etc. CALIFORNIA REPRESENTATIVES: L. Stetson, Polson; O. Simmons, Oakland, (Mill at Clear Lake); Morgan Coville, Lexington, Santa Clara County; J. V. McMillan, Lexington Santa Clara County. Send for Circular, to **KNAPP & GRANT,** Agents for California, 26v13-1y 310 Washington street, San Francisco

## To Quartz Miners and Others.

### NOTICE!

I WISH TO CALL YOUR ATTENTION TO A PULVERIZER of my own invention, which I have called the

### HITCHENS' ORE PULVERIZER.

It is now in operation at the South Park Saw Mill, on Brannan street, between Third and Fourth streets. I am prepared to reduce, to an impalpable powder, quartz, sulphurets, tailings, cement, manganese, charcoal, sands, marble, plumbago, copper ores, etc.

In view of the importance of reducing ores, etc., to an impalpable powder, and being satisfied my invention to be a perfect success, I invite all interested in the subject to examine it. Patent applied for. 1v14-3m **JAMES HITCHENS.**

## IMPORTANT —TO— WORKERS OF GOLD & SILVER ORES.

THOSE INTERESTED WILL FIND IT TO THEIR ADVANTAGE to call on **MR. WILLIAM SLOSSON,** at Prof. V. P. Blake's Office, and obtain a Business Circular, just published by the **WURTZ AMALGAMATION COMPANY** of New York, who have secured, under the Patents of Prof. Henry Wurtz, the sole and exclusive right to the use of sodium in amalgamation. Mr. Slosson is prepared to supply the licenses of the Company, with the material for applying this new and wonderful discovery, by which, in the words of President Barnard, of Columbia College, "two grains of gold may be gathered where but one was before." 19v13-2m

## STRONG & CO'S CELEBRATED UNION PAN!

A fast Grinder and thorough Amalgamator; has double Mullers. Rolling Shoes and reverse action.

Millmen and others are respectfully invited to examine this Pan, before purchasing others, as it gives the best satisfaction. Can be seen in operation, daily, at the San Francisco Foundry, Fremont street, near Mission.

Ores, in lots not exceeding 2,000 pounds, tested by 22v13 **G. W. STRONG, Assayer.**

**ARTIFICIAL SILK.**—A Paris correspondent of the New York Evening Post has the following extract from a French journal:

One M. Tracol, arguing that silk was produced entirely out of the fibers of the mulberry leaf, and that the silk-worm was only a sort of spinning machine that operated on these fibers, set himself to work to discover some method for dispensing altogether with the little animal's intervention. After an immense number of attempts and experiments, more or less at random, he announces that he has at last discovered the means of spinning silk without the aid of the silk-worm—that is to say, of reducing the annual shoots of the mulberry to a mass of filaments, which (according to respectable witnesses) are indistinguishable from those of the cocoon. If this account be really reliable, an immense advantage to the silk trade is about to be gained by the substitution of the stability and certainty of machinery for the present fluctuations in the life and activity of the animal spinner. The occupation of the silkworm threatens to be gone.

We don't see it. Monsieur Tracol may, in his laboratory, succeed in making some kind of fiber from the leaves, but it must, of necessity, be entirely different from that produced in Nature's laboratory. The vital element in the process will be wanting. One might as well plan the artificial manufacture of horse-hair from grass, which is the natural food of the horse, as the making of silk from mulberry leaves, the natural food of the silk-worm. That mysterious force, which, through the medium of an unsightly bush, elaborates the various salts which the soil affords, into the exquisitely tinted rose-petal, is infinite; Mons. Tracol's chemistry is finite. Perhaps the gentleman will next propose to make us a tulip from the materials to be found in a manure-heap?

**THE TRUE SOURCE OF ALCOHOL.**—All alcohol, whatever apparent form it assumes, has one origin. It comes from the destruction of sugar, and has no other source in nature. It is not a production of general growth, like those substances which are created to form the food of man. No chemist has ever yet found it among the compounds built up by plants. The solar beams that "reach like the finger of God across the abyss of space," and in the laboratory of vegetation, take to pieces poisonous gases, and put together their atoms in new groups which are capable of nourishing the animal body; but the celestial force never arranged together the atoms which form alcohol. On the contrary, it is a product of dissolution of the wreck and disorganization of the principles of human food. It has the same origin as those malignant and fatal exhalations which constitute the genius of pestilence—the death and putrefaction of inorganic matter. Indeed, the same act which gives birth to alcohol, also brings into the world a twin compound, which is one of the promptest and subtlest of all noxious gases—carbonic acid gas.

**A NATIONAL CABINET OF MINERALS.**—The Washington correspondent of the Alta says: "Commissioner Wilson has it in contemplation to establish in the Patent Office a museum of minerals, from the various States and Territories; specimens of which will be solicited from miners, mining associations, and others interested in the mineralogy of this country. The project has not yet assumed definite shape, but will doubtless be carried into effect before long. The proposition is to assign a special alcove or cabinet for each State and Territory, in which will be placed specimens of all the minerals known to exist therein, to be so arranged as to afford visitors and scientific men an opportunity for examination. The Commissioner has already collected a large number of specimens, chiefly from the Western States and Territories."

**FEMALE LABOR IN MACHINE SHOPS.**—Something of an innovation in the machine line has recently been introduced into the Morse Twist Drill and Machine Company's Works, New Bedford, Mass., in the shape of twenty-four female machinists—young women—who do filing of a light nature, tend light machines, grind drills, and do other miscellaneous work. They are occupied in work which had been previously executed by boys—are found to be much more manageable, attentive and useful to their employers. They work in an apartment by themselves, are very happy at their work, earn good wages, and are exposed to no improper influences.

**CALIFORNIA THE BEST AFTER ALL.**—A correspondent of the Nevada Gazette, at Boise City, Idaho, writes as follows: "The conclusion of the most experienced prospectors is, that none of the Territories have yet afforded placer or gold diggings in extent or richness at all comparable with the placers of California, and the expression is almost unanimous, that to-day California is the best mining country."

**BRITANNIA METAL** is made by fusing together four parts each of brass and tin, and adding four parts each of antimony and bismuth. This composition can be mixed *ad libitum* with melted tin.

**BENNETT, JUNIOR**, is the latest New York lion. It is said that there is really serious talk of him as the next Mayor! Well, "some men have greatness thrust upon them."

**PRINCE ARTHUR**, a sprig of royalty, aged seventeen, is to have charge of Canada, which is to be a Kingdom.

The Springfield Armory turns out two hundred of the new breech-loaders every day.

### Perry Davis' Vegetable Pain Killer.

The Great Family Medicine of the Age! Pain Killer, taken internally, should be administered with milk and water, and sweetened with sugar if desired, or made into a syrup with molasses. For a Cough, a few drops on sugar eaten will be more effective than anything else. For Sore Throat, gargle the throat with a mixture of Pain Killer and water, and relief is immediate and the cure positive. It should not be forgotten that the Pain Killer is equally as good to take internally, as to use externally. Each bottle is wrapped with full directions for its use. Please read the printed directions.

Sold by all Medicine Dealers everywhere. 9v14-1m

### Allen's Lung Balm

Is warranted to break up the most troublesome Cough in an incredibly short time. There is no remedy that can show more evidence of its merits, than this Balm, for curing Consumption, Coughs, Colic, Asthma, Croup, etc. To Physicians—Physicians having consumptive patients, and having failed to cure them by their own prescriptions, if they desire to try Allen's Lung Balm, by writing to the proprietors they will send a formula which will enable them to judge whether the ingredients are of a superior compound or not. The medicinal properties are extracted by a chemical process. The apparatus by which some of them are extracted cost many thousands of dollars. Dr. H. P. McKEITH, Dentist, Office No. 132 West Sixth Street, Cincinnati, states as follows: "Gentle—About one year ago I took a cold which settled on my lungs. A violent cough was the consequence, which increased with severity. I expectorated large quantities of phlegm and matter. During the last winter I became so much reduced that I was confined to my bed. The disease was attended with cold chills and night sweats. A diarrhoea set in. My friends thought I was in the last stages of consumption, and could not possibly get well. I was recommended to try ALLEN'S LUNG BALM. The formula was shown to me, which induced me to give it a trial, and I will only add that my cough is entirely cured, and I am now able to attend to my business as usual." P. McKEITH

Sold by all Medicine dealers everywhere. 9v14-1m

### SAN FRANCISCO

### UNION BUSINESS COLLEGE

Merchants' Insurance Building,

408 California Street.

THIS INSTITUTION IS DESIGNED TO PREPARE boys and men for business pursuits, and to impart a thorough commercial education. It is conducted upon actual business principles. The student, upon entering College, is furnished with a capital in cash and merchandise, and a place of business, opens an account with the bank, insures his goods in the insurance office of the College, and enters upon the arena of business. He commences speculation, carrying out all the details of trade, buying and selling goods, depositing in and checking from the bank, making and negotiating notes, drafts, bills of exchange, etc., recording the transactions and keeping the books in a regular and scientific manner. From this he advances in other capacities, until he finally takes his position in the Union College Bank, a regularly established institution, complete in all its appointments, and having a circulation of one million in College currency. This course saves from four to six weeks' time in copying useless manuscripts. There is no vacation, and students can enter upon any business during the year. The public are invited to call and examine the various departments. Session day and evening. Address  
JAMES VINSONHALER, Principal.

ELECTROTYPE CUTS, ENGRAVINGS, Etc.—Our Job Printing Office is abundantly supplied with elegant engravings, ornaments, and other embellishments to suit the various branches of industry in this State.

### Gaston's Screw Grinder and Amalgamator

The Best Yet Invented.

For rapidity and thoroughness of work, the machine above illustrated is unequalled by any. It wastes no appreciable quantity of quicksilver, and is of itself a perfect settler. Fig. 1 represents the pan with part of its side removed, and fig. 2 the screw muller, and its shoes. The letters c show the threads of the screw; H, its shoes, and D a low cylinder within which the screw rotates; E, represents open spaces through the base of the cylinder, and F, inclined partitions filling (at those points) the spaces between the cylinder and the shell of the pan. These inclined partitions are to intercept the current of pulp around the pan, as it issues from under the muller, and turn it toward the center again, over the screw. The dies are not shown in the figure—there are eight. Mercury is not ground, nor floured in this pan. The pulp is ground to a slum, with great rapidity; the muller is raised a little and the quicksilver is poured in *en masse*, forming a layer upon the bottom of the pan. The revolution of the screw then forces the pulp down into contact with the quicksilver, into which it is *effectually rubbed* by the shoes, while the screw, being constantly fed by the pulp from above it, presses all under the muller outward—still in contact with the quicksilver, through the spaces, E, and thence over toward the center of the pan, when it is again seized by the screw and forced down into the quicksilver, rubbed into and forced off in contact with it, which process is continued as long as desired. The pulp can thus be forced into contact with the mercury at the rate of 1,000 pounds in three minutes, or twenty times per hour, and none can escape contact with the mercury, that contact being under the immense pressure of the perpetual screw, in addition to that of gravity, which (gravity) is the only available force in the other pans for bringing the pulp into contact with the quicksilver. "A word to the wise is sufficient." The Screw Amalgamator is the cheapest and most efficient pan manufactured. Millmen! call and see one running at the Pacific Foundry. For particulars, address the inventor, H. A. GASTON, at Cosmopolitan Hotel, San Francisco; or R. L. THOMAS, Esq., Virginia City, Nevada. 1v14qr

"Hoadley's" and "Hittinger's" Make,

HOADLEY'S.

FOUR SIZES,

8, 10, 12, and 15-Horse Power,

HOADLEY'S.

3 to 40-Horse Power.

HITTINGER'S.

THREE SIZES,

5, 7, and 10-Horse Power

HITTINGER'S.

TWO SIZES,

5 and 7-Horse Power,

COMBINING THE MAXIMUM OF EFFICIENCY, DURABILITY, and Economy, with the Minimum of weight and price.  
These Engines are favorably known, a large number being in use on this coast for hoisting, pumping, threshing, milling and mining purposes.  
Steam can be got up on these Engines in fifteen minutes after reaching the place of operation, and the time, expense of setting boilers, machinery, and "construction account" saved, (which is often the difference between the successful and unsuccessful prosecution of mining enterprises) in fact, the portable principle is the pioneer's friend, and enables him to draw engines on their own wheels to his cabin door, and plant on the outermost confines of civilization the saw and grist mill, and it has done and will do more to help subdue the continent than any other of the modern motors which are crowding society and normalizing the world.  
All sizes on hand from 3 to 30 horse power, with an without carriages.  
Also, Portable Saw and Orlst Mill.  
For sale by  
TREADWELL & CO.,  
9v14-6ml9 Corner of Front Market and streets.

## New Patents and Inventions.

Under this heading we shall mention, from week to week as occasion may demand, New and Important Inventions; also, the List of Patent Claims recently issued from the U. S. Patent Office to inventors on the Pacific Coast, and other Patent Issues which we deem of local interest to readers on this side of the Continent. Most Patents on this coast are secured through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We are prepared to obtain from Washington, with despatch, copies of any Patent issued.

## RECENT INVENTIONS.

**A BREAD MIXER.**—J. M. Stanyan, of Milford, N. H., has invented a new bread mixer, which has been referred to Solon Robinson, of the American Institute, for examination. He reports that it has been used several weeks in his family, with entire satisfaction. The machine is a tin pan, having a wooden lid made air-tight by a rubber band. The materials for the bread being put into the pan, it is placed upon a pin on a standard, and made to revolve for a few minutes, which does the mixing.

**COUNTING MACHINE.**—The Amador Ledger has received what that paper calls "a very ingenious and accurate machine for counting sheets of paper as fast as they are printed." It is described as having two dials on its face, one marking one dozen sheets, and the other sixty dozen. The little contrivance is particularly adapted to job printing presses, and will be found very convenient in all cases. It can be easily attached to any kind of a press.

## PATENTS RECENTLY ISSUED.

**HAY KNIFE.**—Philo O. Soper, San Francisco, Cal.: I claim, 1st, The point, A, in combination with the blade, B, to act as a self-feeder.

**PAPER-RULING MACHINE.**—George A. Ball, San Francisco, Cal.: I claim, 1st, The division of the cylinder into any number of sections with nippers working between each section and the introducing of movable blocks between each nipper to preserve the circular form of the cylinder, in combination with the nippers, substantially as described.

2d, Covering the cylinder with india-rubber cloth, and placing upon the edge of each section, where the nippers strike, a strip of gutta-percha, as described and for the purposes set forth.

3d, Gauge, rolls, and lock-nuts, affixed to the feed-board.

**APPARATUS FOR AMALGAMATING ORES.**—Abner Bassett, Virginia City, Nev.: I claim, 1st, a barrel, or its equivalent, having a hollow shaft passing through it, by which heat is introduced by exhaust steam or otherwise, substantially as described, and for the purpose set forth.

2d, A hot-air, shell or bath, for the purpose of applying heat by exhaust steam, or otherwise, to the outside of the vessel containing the pulp, whereby obdurate ores are made to amalgamate more freely, substantially as described, and for the purpose specified.

3d, The application of steam or heat to the ore or pulp, both through and around it, without coming in direct contact with it; the said ore or pulp being confined in some suitable vessel, said vessel being inclosed in a shell or bath, for the purpose herein set forth.

**Our Free List** in San Francisco, will hereafter receive the Press through the post office, postage free.

**OLNEY & Co.,** Auctioneers and Real Estate Agents, attend promptly to all business entrusted to their care in San Francisco and Oakland. Mining and other corporations will find Col. Olney well posted and thorough in transacting sales of delinquent stock. Office, on Broadway, Oakland, and No. 318 Montgomery street, San Francisco. uo10

**NATURAL CURIOSITIES FOR CHRISTMAS.**—At No. 522 Pine street, E. F. LORQUIN, the Naturalist, has on hand a beautiful assortment of glass globes full of Stuffed Birds, Shell, and Wax Flowers, besides Feathers, Birds and Butterflies, for ladies' hats, Shells, Sea-weeds, etc. 24v13 gr

**PACIFIC HYGIENIC HOME WATER CURE,** at Fountain Farm, near Oakland. Chartered and conducted according to the teachings of the Hydropathic College of New York, by the Pacific Hygienic Home Association (Incorporated), B. J. SMITH, M. D., Consulting Physician; R. S. MACBETH, M. D., Attending Physician; W. G. W. HARTFORD, Manager; H. ANDREWS, Business Agent. Office, Baths and Lecture Hall, No. 827 Sacramento street, between Montgomery and Kearny streets. ## Quartz Mill Construction and Superintendence.

**THE UNDERSIGNED IS AT PRESENT OPEN FOR AN** engagement as a working Superintendent in the construction or operation of a Quartz Mill. Has had five years steady and successful experience in working ores in Washoe, and is practiced in saving sulphurets and the treatment of rebellious ores. Is prepared to furnish references for all the necessary qualifications of an intelligent, faithful and reliable quartz operator. Address **F. M. SHAW,** San Francisco, care Mining and Scientific Press. 17v14 3m

## HENDY'S LATEST IMPROVED CONCENTRATORS,

FIG. 1.

FIG. 2.

## FOR GOLD AND SILVER ORES,

With Revolving Stirrers and Rotary Distributor.

Can be seen in Operation at the Union Foundry, First St., San Francisco.

The revolving stirrers and rotary distributor can be easily attached to Hendy's old Concentrators, and at a small expense.

These machines have been thoroughly tested, and pronounced a perfect success. The proprietor of this Concentrator feels satisfied that it has NO EQUAL in use. It is designed for saving finely divided Quicksilver, Amalgam and Gold from the sands, and for concentrating and saving the Sulphurets, and is to be placed behind any and all other machines in use. Any person of ordinary experience with Quartz Mills can readily fit them up and run them.

The principle upon which HENDY'S PATENT CONCENTRATOR is constructed, is the only true and mechanical one for the purpose of concentration.

## CENTRIFUGAL FORCE AND GRAVITATION,

Combined as they are in this machine, CANNOT FAIL TO ACCOMPLISH the object sought. Many certificates from proprietors of mills, who have this Concentrator in use, can be had, if required, giving the most flattering accounts of its efficiency.

A most substantial evidence of its worth is the fact that the proprietor is receiving repeated orders from those who are using them, and who have tested their merits.

Those in want of Concentrators would do well to visit some of the quartz mills that have Hendy's Patent Concentrators in use, and satisfy themselves before purchasing other Concentrators of pretended merit. **THEY ARE WARRANTED TO WORK SATISFACTORILY.**

## Directions for Operating Hendy's Concentrator.

The sulphurets are drawn off while the Concentrator is in motion, in the following manner:

FIRST—Set the Pan, A, level, by its inner rim.

SECOND—While in operation, keep the Pan, A, about half full of sulphurets. [See Figure 1, marked S.]

THIRD—Open the gate, E, sufficiently to discharge the sulphurets as they accumulate over the amount above mentioned.

FOURTH—The crank shaft to make 200 to 220 revolutions per minute.

Reference is made to the following mills, which have HENDY'S CONCENTRATORS in use:

EMPIRE MILL.....	Grass Valley, Nevada County.
GOLD HILL MILL.....	Grass Valley, Nevada County.
CONEY & BIGELOW MILL.....	Jackson, Amador County.
SPRING HILL MILL.....	Amador, Amador County.
GOLDEN GATE MILL.....	Volcano, Amador County.
OPHIR MILL.....	Placer County.
C. H. SCHNABER'S MILL.....	Doty Flat, Placer County.
GOLDEN RULE MILL.....	Stewart Flat, Placer County.
BENTON MILL.....	Bear Valley, Mariposa County.
LOUISIANA MILL.....	Coulterville, Mariposa County.
PEOPLE'S MILL.....	Alleghany, Sierra County.
TYRON & CO'S MILL.....	Prescott, Arizona.
WOOLSEY & CO'S MILL.....	Prescott, Arizona.
NOYES & CO'S MILL.....	Prescott, Arizona.
GUADALUPE & SACRAMENTO G. & S. M. CO.....	Sinaloa, Mexico.
TRIUNFO G. & S. M. CO.....	Lower California.

And in use in many other parts of this coast.

For description, etc., see previous numbers of this journal.

## CAUTION.

All of HENDY'S PATENT CONCENTRATORS are marked thus:

"J. HENDY, Patented February 27th and April 17th, 1866."

Orders or letters of enquiry, address,

Feb. 1st, 1867.

Mining Stock Sales of the Week. San Francisco Market Rates. San Francisco Weekly Stock Circular. Stock Prices—Bid and Asked.

## Interesting Mill Experiments.

A correspondent of the Marysville *Appeal* gives the details of some experiments at the Pennsylvania Mill in Brown's valley, instituted with the view of learning the economy or otherwise, of grinding the sands after they pass from the battery.

The tailings from one battery of four stamps, were conducted directly to Chili Mill, No. 1, after having passed over rifles and copper-plates; they were fed in continuously at one side and discharged at the opposite. Result—nothing.

Chili Mill, No. 2, was filled every two hours, by having ten shovelful of sand thrown into it; after running two hours it was carefully discharged. Result, in 24 hours, from 120 shovelful of sand; eight ounces of amalgam.

Chili Mill, No. 3, was filled and discharged in the same way every three hours, in the same manner and with the same quantity. Result, in 24 hours, for eighty shovelful of sand; sixteen ounces of amalgam.

Chili Mill, No. 4, was filled and discharged in the same manner every four hours. Result, in 24 hours, for 60 shovelful of sand; twenty-four ounces of amalgam.

A box placed at the end of the sluices to save floating gold, saved five ounces of amalgam.

A similar class of experiments recently made in Grass Valley, is said to have shown that three-fifths of the gold was the result of trituration after the sand had passed from batteries, and over rifles and copper-plates. The reports of their results are not so complete and minute as are desirable; but they are quite sufficient to open the eyes of our miners to a more careful and thorough working of their ores. All experiments hitherto reported, go to show that where concentrating and grinding is neglected, a very large, if not the largest portion of the gold contained in the quartz is lost.

The amount of gold saved in the batteries, in the Brown's valley experiments, is not given; but the large increase in the yield for four hours, over two hours grinding, is very noticeable; and if subsequent experiments should show that this was not an accidental occurrence, the result is a most important one. The experiments are certainly worth repeating; and if repeated we shall endeavor to give the results.

The unsatisfactory result from Chili Mill, No. 1, shows most conclusively the advantage of working with regular "charges" over that of continuous feeding and discharge. The entire loss was probably owing to the use of too much water, or too low a discharge orifice.

An experiment similar to the above, conducted with pans, would be particularly interesting. We fully agree with the correspondent of the *Appeal*, that it is not the quantity of rock crushed, nor the quantity of tailings we put through our grinding machines; but it is mainly the time devoted to the operation, which, in all cases should be sufficient to make the work thorough and complete. The treatment of auriferous ores,

in all parts of the world, is yet in its infancy; and a most encouraging circumstance, so far as this country is concerned, is the fact that this admission is now pretty generally concurred in by our quartz miners. That fact once admitted, our mechanics and mill men will soon devise ways and means to meet the want of a more thorough working. We have faith to believe that the present year will unfold some most valuable developments, in this important branch of the world's industry.

CANDLE MANUFACTURE IN SAN FRANCISCO.—We are gratified to state that some of the parties who were interested in the candle manufactory of Scoville & Co., which was recently destroyed by fire on the Potrero, have commenced the erection of new works at a point a short distance beyond the old Mission church. The building and works, now going up, will be better adapted to the business than those destroyed; some alterations being introduced which have been suggested by past experience. The fact that those who have already had experience in this business, and who have suffered severely by the casualty of fire, are ready to once more try their fortunes therein, speaks well for the success of the enterprise; and we sincerely hope that better fortune may attend the second attempt to introduce this important branch of manufacture into California. In traveling through the mines, it has come to our personal knowledge that Scoville & Co's candles, hold a good reputation by most or all who have heretofore used them, and we doubt not but that all who feel an interest in building up home manufactures will still continue to give them a preference over the imported article, whenever they can be obtained at equal price and quality.

We further learn that the establishment at North Beach, which has hitherto, for some reason or other, unknown to us, done but little in the manufacture, has now passed into the hands of the Standard Soap Co., which company will hereafter drive these works to their fullest capacity. The time will soon come, as it should have done before this, that California will be independent of other parts of the coast for this indispensable "light for the mines," and other places.

CHINESE AND ENGLISH PHRASE BOOK.—Messrs. A. Roman & Co. have sent us a copy of a duodecimo of 80 pages, with the above title. It has, in Chinese, a great number of the phrases most likely to be used in ordinary conversation, with the translation, and the Chinese pronunciation indicated in English. There is a table of contents, in which the subjects of these phrases are classified, and pagged, so that the desired sentence may be easily found. Benoni Lanctot, the author, states in the preface, that the dialect used is the one most generally understood by all classes of Chinese on the Pacific coast, most of them being from the Canton district. The work supplies a want that is beginning to be felt here.

## Under the Snow.

Some fifty Chinamen, engaged in excavating the tunnel on the railroad line, near Donner Lake, were recently buried under a snow slide. About thirty were rescued; all the others are reported to have perished.

It is generally supposed that a person can live under the snow for a long time; but this is true only when one lies quietly down and is covered by gently falling snow, or dry snow drifting upon him. In light snow, there is a large quantity of air, and a person buried in it, if at no great depth, may be reached by the air from the surface. But if the snow falls damp, and becomes packed, so that it may be cut up and readily handled in large blocks, without breaking, a person imbedded in it, cannot live much longer than though he was covered with water. In a slide the snow is usually closely packed by the weight and resistance of the moving mass; hence if a person is buried to any considerable depth under such snow, rescue must come quickly or death will ensue. Some two or three years since, four well known citizens of Calaveras county, were buried by a snow slide; one of them, Mr. Hansen, was taken out alive, but unconscious, after he had been covered only about fifteen or twenty minutes. He gives the following account of his experience:

He first saw the slide about five rods off; he got hold of a bush and tried to stand up, but the first part of the slide threw him down, covering him to his shoulders, and he was entirely covered by the last portion. He could not move, except his head a little. He butted the snow with his face, so that he had a little air, and hallooed some ten or twelve times, thinking that some of his party were not buried, and would come to his aid. He then lost his consciousness. At first, he could get breath into the lower part of his lungs; but his breath, he said, kept rising, until the last he recollects, was, that he could breathe only into the upper portion. He heard nothing of the others. There were no signs that the others had stirred. It was so packed about Mr. Mercer, one of the persons killed, that when he was uncovered to his knees, they tried to draw him out, and were not able to do so.

BESSEMER, the inventor of the Bessemer process for making cast steel, is said to be receiving \$500,000 a year for the use of his invention. The amount of steel turned out by this process in England, alone, in 1866, is estimated at 250,000 tons. How striking the contrast between him and Cort, the inventor of the puddling process, who died as recently as 1850, poor and broken hearted; and still his invention, at the time it was made, was quite as valuable to the world, as was the invention of Bessemer.

EXCEPTION TO ROTATION.—It is well known that rotation in crops is essential to successful cultivation. Onions, however, are said to be an exception to the rule. In Weathersfield, onions have been raised on the same ground for a hundred years. Only half to two-thirds of a crop is ever realized on land not previously devoted to this crop.

THAT'S WHAT'S THE MATTER!—The *Amador Ledger* of March 2d, has an editorial article on California "wants;" and speaks of the chief one as being "a process whereby all the precious metals may be saved from ores worked." It happened that the next paper which we took up after reading this, was one stating the fact that the first lot of sulphurets worked by Mr. Deetken, at the chlorination works of the Eureka Company, Grass Valley, went within one per cent. of the fire assay! This is suggestive. May it not be that there is, now, right here in San Francisco, everything that is wanted, in the shape of men whose scientific attainments and practical experience would enable them to work any ores in the State? It will not do to attribute want of success in working any particular class of ores solely to the imperfection of the apparatus. Without doubt, in many cases, science is what is lacking; without doubt, the intelligent application of known scientific truths, to the particular case in hand, would often solve the difficulty. But science and experience cannot be had, except at a price such as other professional experts expect to receive in excess of that paid to the rank and file. The candidates for such positions should moreover be subjected to such tests as would effectually prevent the possibility of the selection of any but such experts. In a future number, we may make some suggestions as to the manner in which these tests might be made.

NITROUS OXIDE vs. CHLOROFORM.—A French dentist by the name of Preterre, states that after a considerable amount of experimentation with protoxide of nitrogen, he is strongly in favor of it as an anæsthetic agent. The extraction of teeth, or any operation which does not occupy any length of time, can be done by its aid with perfect ease. The nausea and the depression which often follow the use of chloroform or ether, do not occur.

STEEL has only from one to one and a half per cent. of carbon—while cast iron has four or five per cent.

FOR OUR CABINET.—We have on hand several mutual contributions for our cabinet, which will be fully acknowledged next week.

## Communications.

In this DEPARTMENT we invite the FREE DISCUSSION of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[Written for the Mining and Scientific Press.]

## "Breakage of Steamboat Shafts."

J. S. PHILLIPS, C. E. M., M. E.

MESSRS. EDITORS:—Observing an article in your publication of February 2d, alluding to this subject, which concerns all travelers; and having heard it verbally discussed previously, from its too frequent occurrence, I am incited to forward the following method of general manipulation adopted by the best English firms, and refer those most interested to the valuable experimental tests on the relative strength of iron made by different processes, recorded by Rennie.

The scrap iron obtained by waste forgings, and various worn out articles purchased from old iron dealers, and which are generally of the best quality, because most proprietors know that when work has to be forged to shape, the best is ultimately the cheapest—form the principal supply of these small accumulations, which are placed at all angles, in a sheet iron case, on the end of an iron bar, flattened to retain it securely during its heating in a brick furnace; the other end constituting the handle for transferring the semi-molten faggot to and under what is denominated a "tilt hammer," where it is kneaded between the narrow blocks at a varying angle of about 45° therewith, which is crossed by inversion of work, thereby preventing the tendency to grain in any one direction by this transition. It is cut off, and others are worked on the same handle, shaped and sized as required for after formations.

When a shaft is to be made of any length, these are forged, as above, into such lengths and sizes as are most suitable, and are huddled on a central bar, in concentric rings, fastened by small, flat binding rings, until the first heat solidifies a portion thereof, under the action of a heavy steam hammer, as it rests in a V-shaped anvil-block, compressing the homogeneously prepared bars into intimate union by triangular action, driving the deleterious slags endways before each advancing operation, which insures cohesion of molecules and superior quality. If the skin of the shaft be allowed to remain, this will be stronger than another turned down to size. This contrasts favorably with the plans of slabbing or welding forward in lengths; the iron partaking more of lineal, than transverse or tortional strength.

To illustrate the comparative strengths of iron, faggotted from small scrap, I may state that the eminent Low Moor Iron Company, after tubular boilers were preferred, seeing the necessity for better end plates than had been made by rolling, devised the arrangement of bars of small iron, previously selected, in layers of different angles; or scrap iron in systematic ramifications, to insure the desired equality of strength, and keeping it by the continued advantages of the steam hammer's divergent expansion, and correcting its thickness by rolling, both side and endways with the plates, to finish. This admirable arrangement produced the desired effects—a plate free from the hitherto dangerous and perplexing weakness between the perforations for the tubes, a boon supplied to the public and monopoly of manufacture at much higher price.

In Cornwall, a similar system had been practiced for many years, by Messrs. Harnly & Co., and others, for the machinery of mines. Its superiority is fully recognized by the fact of fifty per cent. extra being given for such iron, and its application to the most responsible places—such as side connection plates for large wood pumping rods, that extend from the surface to 2,000 feet deep; the steam engine working-gear; and lastly, the miner's pick, which is probably the most exacting test of its superior strength and durability. It is harder, more compact, of greater specific gravity and tenacity from varied forces, partaking of the nature of steel, for more uniform strength and durance, though possessed of the advantages of standing much greater heat, and consequent facility of manufacture, welding, etc.

As all practical machinists know that the iron made from the ordinary methods, with-

out this provisional intention for equalization and distribution of fiber, possesses cleavage and consequent weakness, it follows that for tortional strain, it is less adapted because of greater vibratory motion, created by the varying forces applied thereon, provoking electrical changes, from its originally fibrous, to granulous texture, which, exceeding the modulus of elasticity, fracture ensues.

## Separation of Ores—Is it Necessary?

EDITORS PRESS:—I have asserted, through your columns, that the perfect concentration of ores, by means of washing machines, necessitates previous separation into different grades of size. Since that time the subject, previously neglected in this country, has received much consideration; and some have taken exception to my views, which, however, are sustained, not only by well known natural laws, but by the best European practice, and the highest scientific authorities, among whom are Regnault, Overman and Rittinger. If I am wrong, I have at least erred in good company.

The practical application of a theory, however perfect, is governed by possibility and expediency. We cannot do the impossible, nor wish to do that which is not profitable.

There are, doubtless, many cases in which the operation of "sizing" may be dispensed with; as when the whole of the matter is reduced to approximate equality by grinding, as at the Empire mill, at Grass Valley, where the ore passes from the battery through a set of Beth's grinders, and is afterwards treated in pans; or, the quantity of sulphurets may be small, or they may be poor; but when the sulphurets are rich, and the ore is not crushed very fine, it will be found advantageous. A Mr. George, an experienced washer of tin ores, who was engaged in washing, for the third time, the tailings from the Eureka mill, and whose pardon I ask for the liberty I take with his name, told me that he found it impossible to save the fine sulphurets without first treating them in a "huddle," so as to separate the different sizes.

It is true that the "circular shaking table with central discharge" has an advantage over some other machines in this respect, owing to the fact that the current near its circumference is superficial, and almost imperceptible, while the oscillating motion keeps the sand in a loose state, permitting the smaller particles to wedge in between the larger, and facilitating their effect of specific gravity; yet this action has its limits. Furthermore, the sands are more perfectly treated when freed from the slime or mud, which is always present more or less. This is of less importance when the rock is a hard, clean quartz. In the case of silver ores, this slime is frequently the richest portion.

It would be useless in this country, to recommend any process involving repeated handling of the ore. This and the flouring of mercury, are the main objections to working, "by charge," in pans, and to Rittinger's boxes, which discharge at the bottom; but sizing the tailings can be done without handling; and one box will generally be sufficient, its contents can be washed out, and directly into a concentrator.

It is impossible to lay down special rules for all mills. Every case must be decided to a certain extent on its own merits; for, though the fundamental principles are immutable, the variety of conditions is infinite. Many costly errors have been committed for want of attention to this point.

The nature of the ore, the fineness of the gold, quantity of water at command, description of crushing machinery, and situation of the works, from an ever varying combination by which results are modified.

Owners of mills should employ a person possessing the requisite knowledge, and reliable for discernment and accuracy, to determine by observation and experiment, and not by theory alone, the best method of working under attainable conditions. This once done, the work could be continued by a man of less extensive knowledge.

In conclusion, I will observe that the concentration of ores, and separation of mercury, is a subject that is worthy of careful study. It is one of the most difficult, as well as important problems of metallurgy.

## Is it too Late for Sowing Wheat?

BY PROFESSOR ROWLANDSON, F.G.S.L.

EDITORS PRESS:—Many of your readers will probably feel surprised at seeing an article from me under the above caption. A few, however, will probably remember that during the eventful floods of 1861-62, several letters of mine which appeared in the *Sacramento Union* and *San Francisco Bulletin*, on the then all-absorbing subject, attracted no small share of attention. Very few, however, are aware that agriculture as well as mining, metallurgy, chemistry and geology, has long been made a special study by me. These prefatory observations are needed, in order to excuse what might without such explanation be deemed impertinent. The question of the prime "staff of life" to the community generally, and especially the laboring man and his family, is, however, sufficiently important to justify even a slight deviation from ordinary routine, when the actuating motive is for a general and not a personal benefit. The following quotations from an article on the subject, which appeared in last Monday's *Alta*, has given rise to the present communication:

"The continued rains affect the agricultural districts unfavorably. In the Sacramento Basin, from Shasta to Visalia, the farmers complain that the ground is too wet for either plowing or sowing. The *Stockton Independent* says it is now too late to put in grain, but endeavors to draw consolation from the idea that a better system of cultivation will be adopted hereafter. It says: 'The rain this winter has benefitted farmers, inasmuch as it gives proof of the necessity of late spring plowing, and early sowing in the fall. It is to summer-fallowed fields that we must chiefly look in the present season for our cereals. Those who had not plowed their land before the first heavy rains, have been debarred from doing so ever since; and were the sky to become clear to-day, and so continue, it would be a week or two before the valley land could be worked without doing it great injury. But even if land could be plowed during the present month, the season for wheat to grow and mature would be so short that a full crop could not reasonably be looked for. Our winter storms, then, benefit the agricultural interests of the State, inasmuch as they teach farmers a profitable lesson.'"

In brief, late sowing, as a general rule, in California, is to be deprecated, chiefly on two grounds. First, because if wheat is sown so late as March or April, in the majority of years the droughts of summer will usually dwarf the crop. This cause is so apparent and well understood, that it need not be dwelled upon further. The second, and perhaps less understood cause of failure, arises from the fact that it has generally been observed that late sown wheat, especially on lands exposed to the influence of the "summer winds," are often seriously damaged by a disease often denominated blight, but more particularly known as "rust," which destroys not unfrequently from one to two-thirds of the anticipated crop, the balance being also of inferior quality. I think it will be admitted that, generally, when a loss of crop has been occasioned in consequence of the presence of rust, it has occurred almost always with crops sown during the months of January, February and March; but especially during February, and usually during seasons when moisture has been moderately abundant until the month of April and not afterwards. It may be here mentioned that the rust or blight alluded to, is produced by a minute cryptogam or fungus, which disseminates itself through the entire, but chiefly in the generally luxuriant leaves of the wheat plant, in consequence of the existence of favorable conditions for its development—cold and moisture. Now, my theory is this—if wheat is sown during any fine weather between the present time and the second week of April, the chances are strong that sufficient moisture will fall between now and the first week in June to push the plant sufficiently forward to be out of danger from drought; the dry weather which will subsequently ensue will prevent all danger from rust, for the latter is the consequence generally of an over-succulent foliage, and would be perfectly checked by the drought of summer. In conclusion, I may explain that the above recommendation for farmers to sow wheat this season, up to at least the first week in April, is based upon twelve years' observa-

tion; that I have always remarked that during seasons at all approximating to the present for rain, we have never been without sufficiently ample growing showers up to and sometimes into the month of June.

For the emergency of such seasons as the present, prudent California farmers might always be prepared with the seed of some variety of spring wheat.

## The Occidental Mine, Virginia City.

VIRGINIA, Nev., Feb. 18th, 1867.

MESSRS. WESTON & Co.—Gentlemen:—On the 5th of September last I made an inspection of the Occidental mine, at your request, and the results of my observations and assays were communicated in my report of the 10th of that month. In that paper, I stated that a new tunnel had been commenced, with a view of cutting the vein at a perpendicular depth of 200 feet below the then lowest level (160 feet below the crop-pings). One hundred and eighty feet of this lower tunnel had then been completed, and the casing of the vein reached, which presented the same mineralogical character as the casing of the pay ore in the upper workings.

On the 15th of this month, I made another inspection of the mine, and was much gratified to find that my anticipations of September have been fully realized, both with regard to the quality and quantity of the ore reached, although, from an unexpected variation in the dip of the vein towards the perpendicular, the tunnel (running diagonally with it) has had to be carried to a greater distance than was then anticipated. It is now in 400 feet, and a rich body of ore has been struck, which is proved by the incline connecting it with the upper (160-foot) level to be an *uninterrupted continuation* of the fine body of ore which has supplied your mill, and by which upwards of \$250,000 has been extracted up to the present time since the commencement of work on the mine, eighteen months ago.

At this part of the mine the portion of the vein carrying the pay ore has been found to average about twelve feet in width, and, as it has been drifted on, east and west, I calculate that not less than forty tons per day can be taken from this tunnel as soon as it is sufficiently opened to admit an adequate force of men. Thus, on the very moderate calculation that the pay rock does not continue of its present quality (as shown by the following assays) and quantity, for more than *one-tenth* of the extent of your claim (of 1,800 feet), you have, at the present moment, not less than about *four years'* consumption in sight at the rate of forty tons per day.

Should, however, another tunnel be opened at a lower level, I see no difficulty in extracting from 100 to 150 tons of ore per day, which would then place your mine on a par with the best on the Comstock. This operation, however, would be attended with a considerable outlay of capital, which would probably remove it beyond the limit of individual enterprise, and could be most advantageously conducted by a joint stock company.

In order to obtain an average of the quality of the ore now being extracted from the incline and tunnel. I took two samples from each of these parts of the mine, and by assay obtained the following results, viz:

FROM INCLINE—WEST DRIFT.	
Gold.....	\$20 09
Silver.....	75 34
DO.—EAST DRIFT.	
Gold.....	\$12 54
Silver.....	54 97
FROM TUNNEL—WEST DRIFT.	
Gold.....	\$7 13
Silver.....	101 09
DO.—EAST DRIFT.	
Gold.....	\$12 51
Silver.....	40 83
Giving an average of \$57.33 per ton.	

Assuming that the *average* of the bulk of ore thrown on the dump does not exceed \$60 per ton, and that, by the present imperfect system of reduction, only 50 per cent. of the assay value will be obtained at the mill (say \$30 per ton), the gross receipts for four years' working, at the rate of forty tons per day, would be \$1,752,000, or \$438,000 per annum.

With the very liberal allowance of \$12 per ton for extraction, hauling and reduction, it follows that the annual *profit* cannot fall short of \$262,000, or \$1,051,200 from the amount of ore now in sight, and which may be realized within *two years* by a proportionate increase of your facilities for extraction and reduction. I remain, gentlemen, your very obedient servant,

W. T. RICKARD, F.C.S., &c.

## Scientific Miscellany.

**NEGATIVE POLARITY OF RIFLES.**—John Spiller, F. C. S. writes the *Chemical News*, Jan. 11th, 1867: "I find that all the long Enfield rifles, of the arms in possession of the volunteers of my company, exhibit negative polarity, as the result of the violent and repeated concussions attending the discharge in a direction parallel to the magnetic meridian. The Royal Arsenal range runs nearly north and south, and our rifles, when in use, are always pointed either due north, or a few degrees toward the west; in fact, nearly in the direction indicated by a compass needle, so that the repeated shocks brought about by the explosion of the powder, may be considered equivalent to so many hard blows from a hammer, which we know to have a similar effect. The negative character appears to be permanent—which would not be the case if the gun barrels were of the softest description of malleable iron; and the region of the breech is in every instance possessed of north polarity, since it strongly attracts the north pole of the compass needle."

**PRODUCTION OF VALUABLE MANURE FROM THE ATMOSPHERE.**—The highly important agricultural problem of the fixation of the nitrogen of the air in the form of ammonia has been solved by MM. Marguerite and De Sourdeval. Their process is founded on the cyanization of barium, and the subsequent decomposition of the cyanide by steam. A mixture of carbonate of baryta, iron filings, refuse of coal tar, and sawdust, is first calcined through an earthen retort; through the porous mass thus obtained, a current of air is passed, the oxygen of which is converted into carbonic oxide, while its nitrogen is transformed in the presence of charcoal and harim into cyanogen, and produces considerable quantities of cyanide of barium. The calcined mixture is introduced into a strong iron cylinder, and a current of steam at a temperature less than 300° is passed through it. All the nitrogen in the cyanide is disengaged under the form of ammonia. It is impossible, observe the authors, to foresee all the results of this discovery. Among other things it suggests the production of nitric acid from the air by oxidizing ammonia.

**A NEW BATTERY.**—M. Rouillon has described before the French Academy a new arrangement for generating an electric current by the action of aqua regia. A mixture consisting of two-thirds hydrochloric acid, one-third nitric acid, or three-fifths hydrochloric and two-fifths nitric, will easily dissolve gold and platinum, but will only superficially attack pure unalloyed silver; a superficial chloride being formed which protects the rest of the silver like an impermeable varnish, however long it may remain in the aqua regia. If copper be present, the metal is attacked. Rouillon has utilized this fact by making a battery in which pure silver in aqua regia replaces carbon of the Bunsen cell, or platinum of the Grove, in nitric acid. After using the new battery for several months he found no diminution in the quantity of silver and no chloride of silver was formed in the porous cell. The inventor states that his battery is more constant than Bunsen's. If further tests confirm this statement the new battery will soon be brought into practical use.

**NEW HYDROCARBONS.**—Messrs. Friedel and Ladenburg have succeeded in preparing a new hydrocarbon, isomeric with the hydride of anthracene, which they represent by the formula expressing a combination of one atom of carbon with two atoms of methyl and two atoms of ethyl.

The above, we infer, is a different compound from that to which the name of "Chemozene" has recently been given by Prof. Van Derweide, of Philadelphia, who first brought it into notice. Chemozene boils at 40° Fahrenheit.

**IMPROVEMENT IN PROMOTING FERMENTATION.**—Sulphuric acid has been extensively used by distillers of molasses for converting the mash much quicker into vinous fermentation; this process has been improved by the addition of phosphoric acid, according to the suggestion first made by the French chemist Pasteur, who, regarding yeast as a plant containing phosphorus, believed the process of fermentation might be stimulated by that element. Practical results have proved the correctness of this theory, and many distillers now use the phosphate of soda.

**IODINE IN MINERALS.**—A correspondent of the *London Chemical News* of Jan. 4th, signing himself "Smatterer" says: In trying an experiment with about half a ton of German phosphate of lime and sulphuric acid, "I was astonished to see a very considerable evolution of iodine fumes. I exposed a sheet of paper, smeared over with starch, to their influence—the test was undeniable." In the next number, Jan. 11th, "F" answers him thus: "Iodine is known to be present in the phosphorite of Nassau; and Mohr cites the fact as evidence, that this phosphorite is of marine origin."

**BOILER INCrustATIONS.**—Friedrich, a German chemist, has published a method of preventing boiler incrustations, which, however, is only capable of limited application. He puts common pyroligneous acid into the boiler until the water faintly reddens litmus paper. This will, of course, convert the carbonate of lime into acetate, a much more soluble salt, but more of the acid must be added as often as the boiler is fed, since the excess will always distill off with the steam. When the carbonate is the only lime salt present in the water, this method will no doubt prevent the deposition of crust, and the common pyroligneous acid will probably be found as cheap to use as any boiler composition.

**MAGNETISM.**—"If an iron wire be twisted during or even after the passage of a voltaic current through it, the wire becomes magnetic. When the wire is twisted in the manner of a right hand screw, the point at which the current enters, becomes a south pole; in the opposite case, it becomes a north pole. If, during the passage of the current, the wire be twisted in different directions, the polarity changes with the direction of the twist."—*Mech. Magazine.*

**A NEW LIGHT.**—Professor Carlevaris, of Genoa, has invented a new light. It is an oxy-hydro-magnesian flame, and is obtained by placing in the flame of a mixture of hydrogen or coal gas, with air or oxygen, spongy magnesia, a substance of very small cost. The flame is white, rich in actinic force, fixed, and developing less heat than other lights. The expense is very trifling; a light equal to four wax candles, only costing two-tenths of a penny per hour.

**EFFECTS OF ELECTRICITY ON SUGAR AND ALCOHOL.**—It is well known that the effects of fermentation is to change sugar into alcohol, these two substances being composed of the same elements, but combined in different proportions—sugar consisting of  $C^{12}H^9O^6$ , while alcohol consists of  $C^4H^6O^2$ . Experiments have shown that under certain circumstances electricity produces the same effect on sugar as fermentation does, transforming it into alcohol. Niepce de Saint Victor, of Paris, has found that, by passing an electric current through very sugary white wine, the wine loses all its sugar, and becomes much more alcoholic. On the other hand, the effect of the action of light on absolute alcohol, under certain conditions, is to re-transform a portion of the alcohol back into sugar, the alcohol becoming very sugary, and having its strength reduced several degrees.

**HOW TO EXTRACT COLORING MATTER FROM OCHER.**—It is said that coloring matter may be extracted from the various ochers in the following manner: Bake the earths (ochers) in a furnace so constructed that it may be hermetically closed; or they may be baked in iron boxes so made that they may be hermetically sealed. After this treatment, the earths should be washed, to separate them from all foreign substances. The *La Genie Industriel*, of Paris, says that earths so washed make a coloring matter, the shades of which may be easily varied at pleasure, and which form a suitable body for a paint for buildings, and even for coaches, panels, etc.

**SELF ACTING GUN CARRIAGE.**—A Scotch captain, by the name of Moncrieff, has invented an arrangement by which the recoil of a cannon is utilized for the purpose of first throwing the gun into covered position for reloading, and then returning it to position for another discharge.

## Mechanical.

## Cheapening the Production of Iron.

NUMBER TWO.

In our last issue we made mention of the great increase in height and diameter of furnaces, which had recently been introduced into some of the English iron districts. The economy of these furnaces, at least up to eighty feet in height, with twenty-five feet diameter of boshes, has been well established—so well that the Rosedale and Ferry-hill Company were about to blow in a pair of furnaces 102 feet in height, with twenty-seven feet boshes. Two furnaces, ninety-five feet high, with but sixteen feet boshes, have been for some time in blast at Cleveland, England, and have been found to work without any difficulty from weight of superincumbent material or other cause.

It is not yet well determined whether the increased size of furnaces, or the increased heat of the blast has had the most to do with the great economy of fuel, which has now been reduced to 21 cwt. of coke to each ton of pigs from an argillaceous ore containing not over 31 per cent. of iron. A high stack saves fuel by permitting more of the heat of the gasses to be taken up by the materials in the upper part of the furnace; and as the gas is now all taken off and used as fuel for raising steam and heating the blast, it is an advantage to have it as cool as possible, while passing down through the large tubes from the top of the stack to the boiler furnaces and air heating stoves below.

These gasses are now drawn down by means of a steam jet, into a properly constructed hot-blast stove of large heating surface, from which the blast is conducted into the furnace, at a temperature of from 1,000° to 1,200°. The hot blast, as originally introduced, was employed at only 300° of temperature, and the engineers who effected that improvement, counted it as something really wonderful, that it could be economically accomplished. The stoves by which this was done some twenty years ago, presented only from 300 to 500 square feet of heating surface for each 1,000 cubic feet of blast supplied per minute; while some of the stoves now used have 1,250 feet of heating surface and deliver the blast at a temperature of from 1,000° to 1,200°. A single furnace of large dimensions takes from 6,000 to 10,000 cubic feet of air per minute.

In the early attempts to take off the gas, much difficulty and danger was encountered and explosions were of not unfrequent occurrence. With the present arrangement, such difficulties are entirely obviated. At first much of the gas was lost by being burned at the top of the stacks; now but little or none escapes, except through the regular mains leading to the stoves below.

In the best arranged works, the gas is found quite sufficient for raising all the steam required for both blowing and heating the blast. These improvements, it is said, have effected a saving of at least 30 per cent. in the cost of fuel. The method employed for securing, regulating and burning the gas and heating the blast are very ingenious, though not expensive in their details. The fullest information with regard to these matters may be obtained by addressing Mr. James Henderson, 218 Fulton street, New York. The cost of the larger furnaces in England, with calcining furnaces, boilers, blowing engines, stoves, hoists, mains and other materials connected with the "plant" is from \$75,000 to \$100,000. Such furnaces will turn out from 280 to 350 tons of iron per week.

**AMERICAN CHILLED IRON RAILWAY WHEELS** "live" for one hundred and forty thousand miles; the English wrought iron wheels about one-half that, if turned down two or three times. The face becomes uneven, but will be again serviceable for a time, if thus treated.

## Tempering Mining Picks.

There is probably no service to which steel can be put, which so effectually tests its value as in mining picks. The tempering of a pick is a very nice piece of work, and should be done with great care. In the first place a good charcoal fire is necessary, next good steel, then a good light hammer, with a smooth faced anvil, and lastly a man is needed with a good keen eye, considerable experience and excellent judgment. No good pick can be turned out if any of the above essentials are wanting in the process.

A pick should never be "upset" or hammered endwise, nor raised above a full red heat. The steel should moreover be heated as quickly as possible, as long exposure to heat—even if that heat is not in excess—injures its texture. Many blacksmiths find great difficulty in tempering picks, because they do not choose good steel. After being heated, the pick must be worked with care, special pains being taken, in drawing it out, to hammer on all sides alike—in one place as much as another, on one side as much as another.

When ready for hardening it should be heated in the blaze of a charcoal fire until red hot, and then plunged into cold rain water, and kept there until it is nearly cold; but if kept too long in the water, or until it is quite cold, the corners are liable to fly off. Some blacksmiths use salt water. No salts, of any kind, should exist in the water; but the water should be cold; if the water is warm, if a little ice should be thrown in to chill it, the tempering will be all the better. Pure soft water for hardening will make a tougher pick, and one less liable to crack at the edges, than where salt water is used.

The last hammering of a pick should always be given on the flat sides, and across close to the edge, and then up each side about an inch. By so doing the corners will be less liable to crack off. The same process will work well with all edge tools. These directions have been gathered from various sources; mostly from writers in the *Scientific American*, at different times. Only such have been given above as all appear to agree in. Should the careful experience of any of our readers disprove anything of the above, or suggest anything new, we should be happy to report the same. Good, well proportioned and well tempered picks, in mining operations, is a most important consideration; and their "sharpening" should never be trusted to unskilful hands.

**AN IMPROVEMENT IN THE MANUFACTURE OF BARS OF MALLEABLE IRON OR STEEL.**—An invention has recently been made in England, for treating bars of malleable iron and steel in such a manner that they will receive a smooth and polished surface, which will not be liable to oxidize by exposure. Mr. B. Lauth, the inventor, makes, for example, an ordinary bar of malleable iron in its usual merchantable state, and removes the oxide from its surface by the application of diluted sulphuric acid, after which he washes the bar in an alkaline solution. He then covers the entire bar with oil or petroleum. The bar is then ready for the chief process. A muffle furnace is so prepared that a uniform, or nearly uniform, heat can be maintained within it, and in this furnace the bar is placed. Care must be taken that too great a heat is not imparted to it, for on this depends the success of the operation. When the bar approaches a red heat, and when the redness is just perceptible, it is a certain indication that the proper degree of heat has been attained. The bar is then at once removed, and passed through the finishing rolls five or six times, when it will be found to have a dark polished uniform surface, and the appearance of Russian sheet-iron.

The blue protective coating of the Russian sheet-iron is phosphide of iron.

## To Inventors

ON THE

### Pacific Coast.

Messrs. DEWEY &amp; CO.

Take occasion to call your attention to the following rules, regulations and suggestions relative to the obtaining of **LETTERS PATENT** of the United States:

#### Self-Evident Facts.

Having had large experience, and gratifying success with the great variety of cases emanating on this coast, we feel confident of our abilities to assist inventors in patenting their inventions, saving them from vexatious delays, and from receiving worthless papers by reason of imperfect preparation of their claims before being sent to the Patent Office.

The branch of Patent Law is of itself a **SPECIALTY** of legal jurisprudence; or, as Mr Phillips, an eminent Patent lawyer, justly remarked: "The metaphysics of the law."

In early days but little preparation was needed, but ordinary skill required to obtain a patent; but now, by reason of the multiplicity of inventions, and the numerous acts of Congress, found necessary to protect the inventor while the patent lasts, and to do justice to the people after it expires, the utmost care and skill are requisite in managing cases and obtaining a patent that will be of real value to the Patentee, and stand the test of passing through the legal ordeal of an infringement suit.

The general practice of the Patent office regarding the examination or issue of Letters Patent for inventions has not been materially changed for many years, yet there have been amendments added to the laws of 1861, 1863 and 1866, and which it is necessary for all parties managing an application to be conversant with. Old inventors invariably advise the employment of none but agents of responsibility and experience. As agents with such qualifications, we solicit your patronage.

#### Confidential Advice.

Those who have made inventions and desire to consult with us respecting the same, are cordially invited to do so. We shall be happy to see them in person at our office, or to advise them by mail, or through the **MINING AND SCIENTIFIC PRESS**. In all cases they may expect from us an honest opinion. For these consultations, opinion and advice we make no charge. A pen-and-ink sketch and description of the invention should be sent together with a stamp for return postage. Write plain, do not use pencil or pale ink; be brief.

Remember all business committed to our care, and all consultations, are kept by us secret and strictly confidential. Our permanent business interests demand, as it were, a sacred compliance with our obligations as solicitors, and in reference to our strict fidelity in this respect we refer to one and all of the hundreds of inventors and patentees on this coast who have patronized us.

#### Letters Patent.

A patent is an open letter, embodying all the language of an inventor or his agent, contained in the specification, without alteration, and is granted to citizens of the United States, or those who have declared their intention of becoming such, and is signed by the Secretary of the Interior and the Commissioner of Patents, with the seal of the Patent Office affixed. Its jurisdiction is for the whole United States, for the term of seventeen years.

A patent right is personal property, and is assignable, but cannot be seized and sold on execution.

#### What Claims can be Patented?

A knowledge of Ancient and Modern Mechanics and familiarity with American and Foreign patent issues and rejections, enables us to determine in a measure in all cases what can be patented, and how much can be claimed as new and novel, and be covered by Letters Patent. This is one of the most difficult questions encountered by both old and new inventors—*one* in which an experienced counsel is of great service—and yet it can never be positively determined except by presenting a formal application for a patent to the Government, embracing a petition, specification, model, duplicate drawings and payment of the first government fees.

#### Steps Necessary to Procure a Patent.

The **FIRST** thing required is a model, if your invention can be represented by one. It is not only immediately necessary in preparing the papers, but the law demands that the inventor shall, in all cases, furnish a model, which must not exceed twelve inches in any of its dimensions. A less size model will answer when more convenient. It should be neatly made, and of hard wood or metal, or both, varnished or painted; the name of the inventor should be engraved or painted on it in a permanent manner.

When the invention consists of an improvement on some known machine, a full working model of the whole will not be necessary. It should be sufficiently perfect, however, to show, with clearness, the nature and operation of the invention.

As soon as the model is ready, it should be carefully boxed and shipped by express, or otherwise, to our address, namely: **DEWEY & CO., Mining and Scientific Press, San Francisco.** Prepay expenses and send express receipt to us by mail.

A full description must also be sent with the model, embodying all the ideas of the inventor respecting the improvement.

Simultaneously with the model, the inventor should send us the first installment of the Government fee, fifteen dollars. The money may be forwarded either by express with the model, or by mail. The safest way to remit is by draft on San Francisco, payable to our order. Always send a letter with the model, and also the remittance, stating the name and address of the sender. On the receipt of the model and Government first fee of \$15 in currency, the case is duly registered on our books, and the application proceeded with as fast as possible. When the documents are ready we send them to the inventor by mail, for his examination, signature and affidavit, with a letter of instruction, etc. Our fee for preparing the case is then due and will be called for. The case will then be presented to the Patent Office, and as soon as the patent is ordered to be issued the Government last fee of \$20 in currency will be required. The law states that every patent shall be dated as of a day not later than six months after the time at which it was passed and allowed, and notice thereof sent to the applicant or his agent. And if the final fee for such patent be not paid within the said six months, the patent shall be withheld, and the invention therein described shall become public property as against the applicant therefor.

Inventors who do business with us will be notified of the state of their application in the Patent Office, when it is possible for us to do so. We do not require the personal attendance of the inventor, unless it is one of great complication, as the business can be well done by correspondence.

When the invention consists of a new article of manufacture, a medicine, or a new composition, samples of the separate ingredients, sufficient to make the experiment, and also of the manufactured article itself must be furnished, with full description of the entire preparation.

The average time required to procure a patent, when the case is conducted at our agency, is three months. We frequently get them through in less time; but in other cases, owing to delay on the part of Government officials, the period is sometimes extended to four or five months, and even more. We make a special point to advance our cases as rapidly as possible.

#### Saving of Time.

In urgent cases for an immediate patent, persons can deposit the amount of the last fees with us, in San Francisco, and have our Washington agent procure the issue of the papers as soon as granted, saving the two or three months time which would otherwise be required for the inventor to receive notice and then forward the money. Money advanced for this purpose will be returned, should the application be rejected. By adopting this course, we are enabled, with our other advantages, to secure the receipt of patent papers to inventors on this coast, at least four or five months sooner than can be done through agents in the East, without the applicant going to the hazardous expense of sending on the last fee before it is known whether the patent will be granted.

#### Expense of Applying for Patent.

The Government fee, on filing an application for a patent in the United States, is fifteen dollars; and if the patent is allowed, twenty dollars additional is required. If rejected, the first fee of fifteen dollars is all that is demanded. English, French, Austrian, Prussian, Spanish, and inventors of every nationality, may now obtain patents in the United States upon the same terms as our citizens. The only discrimination made is against subjects of governments that discriminate against the inhabitants of the United States.

To the foregoing official fees must be added fees for preparing the various documents and expense of drawings. Our charge for preparing a case, presenting it to the Government, and attending to all business connected with it, varies from \$20 to \$40.

Following is the list of Government fees:

On every caveat.....	\$10
On every application for a patent, for seventeen years.....	15
On every application for a design, for 3 yrs and 6 mos.....	15
On every application for a design, for seven years.....	15
On every application for a design, for fourteen years.....	20
On issuing each original patent.....	30
On filing a disclaimer.....	10
On every application for a re-issue.....	30
On every additional patent granted on a re-issue.....	30
On every application for an extension.....	50
On the grant of every extension.....	50
On appeal to the Examining-Chief.....	50
On appeal to the Commissioner from Examining-Chief.....	50
On every appeal to the Judges of Circuit Court.....	25

#### Caveats.

A caveat is a description of the invention designed to be patented, lodged in the Patent Office before the patent is applied for, and while the inventor is perfecting his design. When properly made, it operates as a bar to applications respecting the same invention from any other quarter; but when improperly done, it is inoperative by reason of such defect. The Patent Office always returns a receipt for caveat papers with a copy of the laws governing the same, but does not seek to point out its incorrectness, unless there be some glaring defect.

If worth filing at all, these cases should be prepared with very great care and caution.

One inventor on this coast, who had filed a caveat by an attorney, was, sometime afterward, surprised to find that his invention, which was a very important one, had been patented and was being brought out by an eastern company with a capital of more than a million of dollars. Upon inquiring at the Patent Office, he was informed that his caveat was inoperative by reason of imperfections and his not having complied with the law in that case as made and provided.

Our fee for the service varies from \$10 to \$20. The Government fee, under the new law, is reduced to ten dollars. This latter sum does not now apply, as heretofore, as part of the fee on presenting an application for a patent.

Inventors will oftentimes find it very important to take advantage of the caveat system—the expense under the law being comparatively small.

To enable us to prepare caveat papers, we only

require a sketch and description of the invention; no model being necessary.

If an inventor publicly uses and sells his invention, prior to making application for a patent, he cannot, afterward, prevent others from doing the same thing; and should any party put the invention into use, before such application for a patent is made, they could continue to use the specific machine or composition of matter after the patent is issued to another. Filing a caveat does not give the right to affix the words, "Patented," or "Patent applied for."

#### Patent Rejections.

First. Refusals are always made by the Patent Office if there is any informality in the specification, or if it does not contain the entire subject matter of the invention, and is not properly arranged and stamped. A slight omission often proves fatal.

Second. If the drawings are defective, and are not executed in an artistic manner in India ink, and on sheets of the required size, they are subject to rejection.

Third. Applications are always rejected where the claims conflict with others already patented.

If the rejection should be an unjust one—which sometimes happens—it can generally be reversed, and the patent obtained by contesting the case.

For the prosecution of such cases, obtaining references, making arguments, and personally attending to explain the case (through our agent in Washington), we charge no second fee, as is the case with some agencies, but attend to the business till finally allowed or rejected, without extra charge, beyond the Government fee.

Inventors who have rejected cases, prepared either by themselves, or for them by other agents, and desire to ascertain their prospects of success by further efforts, are invited to avail themselves of our unsurpassed facilities in securing favorable results. We have been successful in securing Letters Patent in many such cases. Our terms are very moderate.

#### Advantages to Patrons of Our Agency.

Some of the advantages to be obtained by patronizing us, may be enumerated as follows:

1. Inventors on this Coast having their applications for patents made out through our agency can sign their papers at once, and thus secure their rights at least *three months sooner* than by trusting the same to distant agencies, situated at New York or Washington.

2. As many of the inventions conceived here are especially adapted to the Pacific Coast, they should be properly brought out here, which can be accomplished (if the invention is a meritorious one) by illustrating the subject, with a careful description, in the columns of the "Mining and Scientific Press," free of charge; the inventor paying simply for the engraving, which will be executed at a moderate charge. The same cuts can be subsequently used for hooks, letters, or circulars. In a word, we are determined to make it of decided interest for every inventor on this Coast to patronize home talent and enterprise.

3. Most inventions on this Coast are for objects and purposes but little understood by parties at Washington or other parts of the East. Our mining machinery, processes and operations are best understood by those familiar with their use; and a personal, verbal explanation is oftentimes of important service, and enables us to be more successful than agents generally.

4. Remittances of money made by individual inventors to the Government sometimes miscarry, and it has frequently happened that applicants have not only lost their money, but their inventions, also, from this cause and consequent delay. We hold ourselves responsible for all fees entrusted to our agency. By sending duplicate correspondence to our Washington agent we avoid hazardous delays.

#### Dangers of Delay.

Situated so remote from the seat of Government, delays are even more dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valuable patents may be lost by the extra time consumed in transmitting specifications from Eastern agencies back to this Coast for the signature of the inventor, or by reason of return for amendment when addressed directly by the inventor to the Government.

#### Re-Issues.

When, through "inadvertence, accident, or mistake," an insufficient or defective patent has been issued, the defects in the Specification and Claims can be cured by a *re-issue*. In order to obtain this, the inventor, or the holders of the patent, must surrender the patent, and file an amended specification and drawings, and a statement specifying the ground for asking for a re-issue. Re-issues are generally applied for after it has been found that the patent could not withstand litigation. It is, therefore, especially desirable that the new Specification and Claims should be prepared with great care and skill. Terms liberal in these cases.

#### Foreign Patents.

In addition to American patents, we secure, with the assistance of co-operative agents, claims in all foreign countries which grant patents, including Great Britain, France, Belgium, The Netherlands, Prussia, Austria, Russia, Spain, British India, Saxony, Hanover, Sardinia, Norway, Sweden, Australia, Mexico, Victoria, V. I.

Many valuable and important inventions of Americans are being yearly surreptitiously patented in foreign countries, some of which governments allow it, thus depriving those who have valuable inventions from their rights.

Patents obtained in England, France and Belgium, will secure the rights of an inventor among

many millions of the most enlightened people on the globe; it is therefore very important, if the invention is valuable, to secure foreign patents.

Our schedule prices for obtaining foreign patents, in all cases, will be as low, or lower, than those of any other agency.

#### To Eastern Inventors.

Our close proximity to Mexico, Australia, and the Islands, enables us to obtain Letters Patent for you with much less delay and expense than they can be secured through any other agency in the United States.

Comparatively few inventors seem to be aware that Melbourne, in Australia, is a city nearly double in size to San Francisco, besides the adjacent colonies of great commercial and mineral importance. Inventions of all kinds, but especially those relating to the saving of gold and silver, if secured in Australia, will often prove of great value. We have competent agents there, and can promise that the business will be attended to with fidelity and dispatch.

Address,  
**DEWEY & Co.,**  
Mining and Scientific Press Office, San Francisco.

1415-tantf  
See a journal has been needed on the Pacific Coast. The Press fills the bill.—In our River Weekly.

## Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

## CALIFORNIA.

## Alpine County.

The *Miner* has an editorial on "The true Policy." It urges the Alpine men to "put their shoulder to the wheel, and help with all the means at their command to put up and work small prospecting mills and furnaces," in order that the method of profitably extricating the precious metals from the ores of that county may be determined by actual experiment. They have waited on "San Francisco smarties" and Eastern capitalists long enough. They must first prove, by the shipment of bullion, that they have rich ledges; then there will be no lack of capital. The trouble is, that although there are mills now idle in the county, it is not for lack of ore, but because they are not adapted to that peculiar class of ores.

The product of the first working of Leviathan by the Alpine mill is before us in the shape of a brick about three inches long by one three-quarters wide and an inch thick. An assay of the bullion shows the result per ton of ore to be—gold, \$95.60; silver, \$35; copper, \$15. The ore worked was not selected. This has been a thorough test of the Freiberg amalgamation, and also of the pan process, of working this ore, and, though the result is good, it is found, as in the case of the Morning Star ore, that there is too much metal in it to work profitably by any other process than smelting.

## Amador County.

From the *Ledger* of March 2d: The last lot of rock taken from the Anaconda mine, at Pine Grove, and crushed at Paugh's mill, paid \$20 per ton; in addition to this, the owners had previously pounded out in a hand mortar, from the same lot of rock, sufficient gold to make the rock pay, in the aggregate, \$36 per ton.

After lying still for three weeks, on Monday last the Coney & Bigelow mill was again put in motion, and the whistle is now heard regularly at morning, noon and night.

## Calaveras County.

From the *Chronicle* of March 8th: E. Grant, who has been engaged for some time past in prospecting the bed of Rich Gulch, struck some very rich gravel last week. Eighty dollars was taken out by him from a space not exceeding six feet in length. Howell & Co., have been busily engaged working their claim. Hoey & Co., in the same district, have been doing remarkably well during the entire winter.

## El Dorado County.

From the *Placerville Courier* of March 9th: Mr. McManus has shown us a very rich piece of rock from the claim of W. W. Stewart & Co., at Kelsey. The piece shown us is a fair sample of a large lot of rock taken out of the shaft at a depth of eighteen feet. The ledge is two and a quarter to three feet wide.

From the *Democrat*: Judge Reid & Co. have taken up and are prospecting a mammoth quartz ledge, near Webertown, Diamond Springs township, about three miles from this place. They have sunk a shaft to the depth of thirty feet on the ledge, and are now running a tunnel to tap it. The tunnel will be about 180 feet in length. The ledge is from ten to fifteen feet in width.

## Los Angeles County.

From the *Wilmington Journal* of March 9th: Quite a buoyant feeling prevades many in the city of Los Angeles, owing to the discovery of rich gold quartz in Soledad mining district, in Los Angeles county. A specimen now in our possession, is of the richest character. Responsible and reliable parties are now at the spot, and in a short time will render a true statement.

## Mariposa County.

A letter from Coulterville March 6th, to the *Gazette*, March 9th: Douglas, Chamberlain & Co. have been driving ahead with their usual energy. They are taking out very good ore.

A San Francisco party have purchased, conditionally, the Mary Harrison and Malvinia veins and mills, from the French Company, and will start in a few days with a full force. Dr. McLano is working vigorously in his mine at Pinon Blanco, and will, no doubt, erect a mill during the present season.

There is yet no machinery in operation on the Virginia.

Messrs. McKee & Flannigan have now two arrastras in operation. They took from one arrastra, for five days run, about 125 ounces.

The old Goodwin mine on the North Fork, now owned by Peter Wynants, is a paying property—the last crushing yielding \$55 per ton. They are now sinking a shaft for another level.

Close by the above, on the North Fork, is Mr. H. Coward's mine, which is doing better than ever. In a five days run with a 5-stamp mill, he took out over 200 ounces, besides carrying into Coulterville a considerable quantity of ore that was too rich to put through the battery. The Marble Springs mine is looking well. The Jenkins Bros., on Bull Creek are doing well. The Ferguson mine is paying largely.

## Nevada County.

From the *Gazette* of March 7th: French Corral, has been remarkably dull the past three weeks, on account of trouble between the water company and the miners. It is rumored, however, that terms of compromise are under consideration.

Same of 8th: We are informed that a rich strike was made yesterday in the north drift of the Pennsylvania mine. The ledge is said to be two feet wide, and very rich in free gold.

Same of 9th: Morrow and Cobb cleaned up a day or two ago, in their hydraulic claims at Scotch Flat, after ten days' run, the yield being \$1,830. The Dutch boys—Johnson & Co.—whose claims are near by, cleaned up \$1,000, from a ten days' run.

Same of 11th: Eighteen tons of rock from the first northerly extension of the Banner mine, was crushed last week at Stiles' mill, and cleaned up on Saturday. It yielded a little over thirty seven ounces of gold, worth twelve dollars an ounce—the rock paying about twenty-five dollars a ton.

We understand that the suit of Horace Beach against the owners of the Eureka mine has been settled—the latter paying Beach \$4,500 for his claim.

The cement mill of Goodspeed, Carney & Co., at Hunt's Hill, which was destroyed by a cave of the bank some two months ago, has been rebuilt, and will be started again to-morrow.

We are informed that Williams & Co. have struck the richest kind of cement gravel, in their claim at Red Dog, and their mill is kept running night and day.

The earnings of the Eureka mine, at Grass Valley, for some time past have amounted to \$30,000 a month, that being the regular monthly dividend. Since the 1st of this month, however, the sum of \$50,000 has been divided among the owners, amounting to \$2,500 an interest.

Same of 13th: It is probable that one or more companies will be organized the present season for the purpose of re-opening the old Nebraska and Live Oak channel. Some four thousand feet of this was worked in the three or four years following the location of the claims in 1852. Three millions of dollars have been taken from it. This channel in all probability extends ten or fifteen miles up the ridge. It is safe to conclude that every mile of it is rich.

From the *Transcript* of March 7th: The hydraulic claims formerly known as the Austin Diggings, at Scott's Flat, now owned by Summers & Co., after a run of ten days yielded between sixteen and seventeen hundred dollars.

Same of 12th: The Banner mine will, in all probability, show a larger return of rock for the year than any other in the country. The ledge is very large, and sufficient rock has been obtained to keep two mills in constant operation. A clean up of fifteen tons at Stiles' mill, last week, gave \$25 per ton.

From the *Grass Valley Union* of March 6th: Seven years ago, the owners of the Norambagua mine, located in Forest Spring, commenced the immense undertaking of running a tunnel from Wolf creek to their mine, a distance of eleven hundred feet. This tunnel, which is five feet wide by seven feet high, and drains the mine at a depth of two hundred and fifty feet, was completed on the 4th inst.

Same of 9th: The Osceola quartz ledge, situated half a mile south of Rough and Ready, was sold on Thursday last. We are not informed of the precise figures, but understand the sale was at the rate of one dollar per foot—there being 3,600 feet in the claim. The late owners were Messrs. Joseph Endey, E. W. Roberts, W. B. Ever and C. W. M. Smith; the purchasers, Thomas F. Mason, of New York city, and George W. Tew, of San Francisco. The new proprietors are men of means, and have purchased the mine, not for speculative purposes, but for actual working operations.

Same of 12th says: We have in this township twenty-five quartz mills, running 286 stamps, and two cement mills running 168 stamps. The capacity of quartz mills is 568 tons every twenty-four hours.

EXCELSIOR.—From the *Meadow Lake Sun* of March 2d: "What we want is capital. Nowhere, within the range of our observation, can such natural inducements for the investment of capital be found, as in Excelsior. All the apparent failures in milling

here, have resulted from two causes—in efficient machinery—and a want of adaptability of machinery used to the purpose required. To sustain this, it is only necessary to mention that those failures were upon rock, which gave good results elsewhere. Rock from many of the ledges, yields the gold readily, to the most simple process; while the highly sulphureted ores in which the district peculiarly abounds, require a different treatment. The recent success of the chlorination process gives new encouragement."

## Placer County.

A letter from Colfax to the *Placer Herald* says, March 5th: Surface diggings have recently been found near here which yield well, and may yet prove a big thing. Messrs. Walker, Johnson, Himes and Burkley own the mines. Sluicing has been going on several days. A new quartz mill is about to be erected, one mile west of town, to crush the rock of the Rising Sun, Montana, and other ledges.

## Plumas County.

From the *National* of March 12th: The miners around Silver Creek are doing well, and also at Eagle Gulch. Johnson & Bro., on Arkansas Ravine, have not as yet cleaned up. The same with Newt. Evans. John Akers, on Island diggings, has discovered a very rich deposit, and has commenced to bring in a ditch from Rock Creek. Morris Smith and Bro. on Reynolds' old diggings, are said to be making \$10 per day to the hand. Austin, on Slate Creek, is making wages. Squires Jacks and Brown have leased the Spanish Ranch ditch. Ed. Metcalf is making wages.

## Shasta County.

From the *Courier* of March 9th: We understand that Mr. Walsh has effected a sale of the Chicago claim to parties in San Francisco for \$35,000, the first instalment of which amount has already been paid.

A specimen as large as an egg and nearly pure gold, from French's claim, Churntown, was shown us the other day.

Kelly & Co.'s mill, now complete and in perfect working order, will commence a run on rock from the Jollie lode, at Muletown, on Monday next.

Mr. Hawley, of South Fork, has attached Conger's Little Devil Quartz Crusher to Ellsworth's mill, and engaged in prospecting rock from the Pacific. The indications are that it will yield as high as \$200 to the ton.

J. J. Bell informs us that an English company, of Swansea, Wales, has offered to lease the original Williams & Kellenger mine, at Copper City, paying a certain proportion of the receipts, for a certain number of years. It is probable the proposition will be accepted.

## Sierra County.

From the *Messenger* of February 23d: The new tunnel of the Good Hope company has reached the ledge, and exposes better rock than has been found before. If the storm ever ceases, the Slug Cañon Quartz mill will commence crushing some of the best rock found in the mine. The dump-house is already nearly filled.

Letter to same from Morristown: Last week the American company cleaned up three of their head boxes, and took out over five thousand dollars. This is only a partial clean-up, as their ground sluice is over seventy feet long, and was not run down.

Letter from Scales' Diggings: The mines are doing well, with prospects of bettering. Miles & Hughes, at Union Hill, Boyce Bros., at Fairplay, and Chesney & Co., at Council Hill, are all doing well.

From same of March 9th: The New Orleans claim at Little Grizzly is reported as paying handsomely, as high as eight or nine dollars per day to the hand.

Letter to same from Howland Flat: The Union company have suspended operations in consequence of a broken wheel. The Hawkeye have got very rich gravel and employ several hands. The Pittsburg is daily expecting to strike the nuggets as of yore. The Monumental have at length reached the goal of their most ardent hopes, and some of their gravel is pronounced equally as rich as any in the Pittsburg in her palmiest days.

## Siskiyou County.

Oro Fino correspondence of the *Yreka Union* has the following: The hydraulics have been in operation most of the winter, stripping the bedrock, which will soon be ready for the process of cleaning. We understand that San Francisco capitalists are investing capital in Indian Creek and Cottonwood diggings. We think they would do well to call and see us before they leave. The little valley immediately below the diggings, now being worked, is undoubtedly as rich mining ground as any in the county, and a few thousand dollars could be profitably invested in opening it. Considering all things, Oro Fino will compare favorably with any other mining camp in the county.

## Yuba County.

The Smartsville correspondence of the *Appeal* says, March 8th: The Andrew Jackson Quartz Mining company stopped work on the 4th instant. The incline shaft of this company is down some one hundred and five feet, and is a good piece of work. The Captain Bunker company has sunk a shaft ninety feet deep, and run a tunnel one hundred and fifty feet deep. They are thought to be twenty feet from the ledge. The shaft of the Mark Anthony is down 106 feet. It is a double shaft, and well timbered. They have got out about 2,000 tons of ore. The sulphurets are gold-bearing and rich. From some tests made in San Francisco by mill process, the company have had returns showing twenty dollars per ton in free gold. The Wauketan, near Sucker Flat, has a shaft forty feet deep, with an 8-foot ledge. The Blue Gravel company are in 560 feet in their new bedrock tunnel. The Blue Point company are using nitro-glycerine. The experiment is said to be a success.

At Strawberry Valley the Eagleville quartz ledge has been paying very well this winter, under the control of Said & Gashrie. They have struck a ledge in their lower tunnel nine feet and four inches in width, which is very rich all the way across.

At Camptonville, Hon. P. B. Hugg has finished his tunnel and will commence washing as soon as the weather will permit.

The *North Californian* says: The Blue Gravel, of Smartsville, made a clean-up last week of about half their flume, taking out \$32,000 more for the number of boxes than in any monthly washing hitherto.

## ARIZONA.

From the *Arizona Miner* of February 9th: About a week since it became known to a few of our people that a new discovery of gold placer and quartz mines had been made east of Silver Mountain, on Oak Creek, which drains the south side of Bradshaw Mountain, some sixty miles south of Prescott. \* \* \* The evidences of a rich and extensive mining region, heretofore unknown, to be called the Agua Fria District, are abundant. We hear but one opinion expressed.

It is reported that several New Yorkers, representing large capital, have recently arrived in this city, on their way to examine Arizona mines with a view to investment.

## IDAHO.

From the *Owyhee Avalanche* of March 2d: Developments on the Dushaway ledge are encouraging. Shaft is down seventy feet, and tunnel started south. Vein of good quartz is disclosed in the tunnel of over three feet in thickness. It assays richly. None has been milled, but will be, as soon as the road to the Shoenbar mill is passable. . . . The reports from the Woodstock ledge are flattering. Work is continuing, and the ore is showing richer. . . . Mr. Smith, who owned fifteen feet in the Hays & Ray ledge, recently made a sale of it in New York to P. F. Bradford, Esq., for \$4,360. . . . The Oro Fino and Morning Star Mining company expects to work its own mines the ensuing season.

Capt. E. D. Pierce has induced a company of about twenty-five men to go with him prospecting into the old hackneyed "Red Mountain" country—or west slope of the Goose Creek Range.

Work on the Poorman has commenced. . . . In our item on the result of some first-class Silver Cord ore we gave it as \$2,600 per ton, and it should have been \$26,000.

Letter to same from the Placer mines at Blue Gulch: The miners on Jacobs and Blue Gulches are putting their claims in thorough condition. There will be five hydraulics started as soon as winter comes. Jennings, Smith & Co., of the Bell claims, Wm. Denning & Co., A. Myers & Co., and J. H. Coaley & Co., will all be ready.

The channel leaves the gulch at the lower end of Myers' claims, and has been traced over half a mile in the mountain. R. Davidson & Co. sunk two shafts on their claims to the depth of forty feet, and got the best prospects I have seen for years. There is about twenty-five feet of good pay dirt in the shafts, with facilities for easy mining.

Prosperous times are promised in the Flint district. Greenwell & Co's mill is at work, and Black's mill will soon start. An assay of ores from the Sherman ledge gave \$4,869.75 of silver, and \$7.25 of gold, per ton.

The Lemhi excitement continues. A number of citizens have started, and others are making preparations. The news from that place is conflicting, though inclines favorably.

Letter from Leesboro (Lemhi) to the *Idaho World* says: "Nappias Creek prospects well for seven or eight miles, and some claims paid from eight to twenty dollars when worked last fall. One claim paid

\$500 for three men in one day's work. I helped Tom Wright to rock two half days. The first day we got \$20.87; the second, \$19. The mining claims are the size of those in Boise, and every man that discovers gold in a new creek, gulch, bar or hill, is entitled to a discovery claim. The ground needs no representation until June, when jumping will commence, as some men have as many as thirty claims, and it will be impossible for them to represent all. These mines are in the big bend of Salmon river, and there are six different districts, with some ground known to be rich on each of them.

From the *Leavenworth Journal* of Feb. 18th: About thirty miners are working on Gold Creek, a tributary of the Palouse, forty-five miles from Lewiston. The wages average from four to nine dollars per day. Only twenty inches of snow, water plenty, and not any very cold weather so far.

Same of 8th: Miners all busy on Salmon River. The high water had done some damage in carrying off wheels, but the prospects are generally good.

Letter from Grantsville to the *Montana Post*: Jackson & Co's ditch will be three and a half miles long, and is intended to convey water to work California bar, which the owners think a big thing.

In the Idaho district two new gulches have been struck, viz.: Missouri and Alabama, with eight cuts to the pan on the bedrock.

From the *Idaho World* of February 16th: The dripping of water into the tunnels in the Buena Vista Bar district is so troublesome that the work in them has been temporarily suspended. Along Moor's Creek, claim owners are making head dams and preparing in other ways for the volume of water which is sure to pour down when the breaking up of winter ensues. The prospects for the succeeding year, in mining about this whole Basin, are very gratifying. Big products are predicted by old miners.

From the *Times* of 22d: A shaft has been sunk to the depth of sixty feet below water level in the Juniata tunnel, and found a well defined ledge three and a half feet in width. Mr. Kelly, at the Illinois, has a ledge of four feet. The ore will average from fifty to one hundred dollars per ton. The Landon shaft is ninety-seven feet deep, where a good ledge is displayed two and a half feet width. The rock looks well.

#### MONTANA.

From the *Post* of February 9th: Bush & Co's mill, at the Lucas lode, in Summit district, will start up again in a few days. The company is engaged in sinking a new shaft on their lead.

Helena items: The Hendry mill in Grizzly Gulch has been rushing through the quartz during the past week, with a result that is far ahead of anything previously done. There was cleaned up from this mill on last Wednesday, from a six days' run on Union ore, the nice sum of \$5,100, in the best looking retort we have as yet seen in the Territory. The mill run eighteen stamps, and crushed some one hundred and fifty tons of rock.

#### COLORADO.

From the *Times* of February 19th: George Mitchell, manager of the Alps and North Star Companies, is now crushing some splendid ore (from the Illinois lode) in the twelve-stamp mill of the North Star Company.

S. P. Lathrop has commenced operations on the "Calhoun Lode," Alps Hill, Leavenworth District. Also Mr. McCaskell on the same lode. Geo. H. Sabin has just built a whim on the "Keystone." Robert Teats is starting up for the Lyon's Co., on the "Crawford." Mr. Whitcomb has started the "Indiana" in Nevada District.

In Russel District, Harry Granniss is at work on No. 5 east, Delaware lode. The shaft is about forty feet deep, and the crevice seven feet between walls. There is a streak of rich looking quartz and decomposed pyrites near one wall, and an exceedingly rich vein of galena near the other.

The Quartz Hill Tunnel Company are now in over 200 feet from the Gulch. Two lodges, at the depth of 50 and 100 feet from the surface, have been passed.

Mr. Fitzpatrick, manager for the Gunnell Company, cleaned up 252 ounces last week. Allowing \$20 currency to the ounce, the above netted \$5,040.00. The run by the Black Hawk Company is given at 248 ounces, and the Smith and Parmelec, 122 ounces. The Eagle Company retorted sixty ounces gold, worth about \$1,200. The total amount shipped this morning by the different hankers, was \$21,120.

In Eureka District, two mills are now running; in Nevada, five; Russel, three; Gregory, fourteen. In Empire District, Clear Creek County, five; Spanish Bar, two; Georgetown, two. Four or five mills are running in Boulder and Park counties.

#### NEVADA.

##### Black Rock.

From the *Susanville Sage* of Feb. 9th: Of all the experiments and tests yet made with Black Rock ore, none have been so successful as those made by Messrs. Ward, Bowman and Harrison, of this place. These gentlemen being largely interested in the mines, have for the past year devoted much time and study to the best mode of treating these ores. For the purpose of testing the matter fully, they rigged up a pan large enough to work eight or ten pounds at a time. From a number of latches of ore worked in this pan, taken from various lodges, they have obtained results varying from \$100 to \$1,200 per ton, but generally ranging from two to four hundred. Their experiments have satisfied them that these ores are not only rich, but among the easiest to work on the coast.

##### Esmeralda.

From the *Aurora Union* of Feb. 16th: We are informed that a ledge forty feet wide, rich in silver, gold and copper, has been found in a spur of the White Mountains, on the eastern side, and about twenty-five miles from Piper's ranch. Assays have been made of the ore which have given full satisfaction, and preparations are being made to test it more thoroughly. Considerable excitement was occasioned in this region by the discovery.

Same of 23d, contains a communication from one who had visited the Osceola mine, belonging to the Empire Company. This company is now idle for some reason which does not appear. The beautiful brick structure containing the reduction works of the company would be an ornament to any city in the Union. In the ore house adjoining the mill are some four or five hundred tons of fine quartz. This mine is worked by levels of eighty feet, each level with an opening from the surface on the slope of the mountain side. The depth attained by these levels is 330 feet below the croppings of the mountain. The writer speaks of the remarkable uniformity of the vein, and the abundant evidence of permanence.

##### Humboldt.

From the *Register* of Feb. 23d: Work on the American Basin Company's mine, in Star district, is being prosecuted with vigor, under T. G. Negus. Their tunnel is now in over 800 feet. Adjoining on the south is the Phoenix Company's claim, consisting of 1,800 feet on the same series of ledges. On this, work has been suspended for some time.

The Golconda mine, in Gold Run district, owned by White & Webb, continues to increase in richness and dimensions. They are now down eighty feet with their shaft, and have a vein of six feet of solid mineral, and have 300 tons of ore on the dump. The result of the working of this ore at Holt's mill is over \$100 to the ton.

Letter to same from Lima district: The Daniel Webster Company has a tunnel 437 feet in length, and is expecting daily to strike the main vein. This tunnel will tap the mine at a depth of 500 feet. He has out several stringers or feeders, containing very rich argentiferous galena. A shaft, eighty feet deep, shows a vein four feet wide the entire distance. The Montana, Sacramento, Bullion and Rochester are lying still, but work will be renewed in the spring. These are all very fine veins, measuring from four to twenty feet on the surface. The croppings by mill process have paid from thirty to seventy-four dollars to the ton. There has been most outrageous management in the working of all these claims, except the Rochester Company. Work on this mine has been necessarily suspended for a time, on account of an immense volume of water filling up the shaft to a depth of seventy feet. Pumping works are to be erected, and work resumed in the spring.

Same of March 2d: The Silver Star mine is improving in size, as well as in the rich quality of the ore as greater depth is attained.

E. J. Elzy, agent of the Monroe Company, now at the East, is sanguine of success in his efforts to raise a large working capital for the development of the mine.

Work is progressing satisfactorily on the Washington Series, Echo district. There is good reason to believe that during the coming summer the company will be ready to build a mill.

The center of attraction this week is at the newly discovered mines near Humboldt Lake, west of Parker's station. We received glowing accounts of these new mines, but too late for this issue.

The Almira, Yankee and American Basin Mining Companies, in Star district, are rushing their work day and night.

##### Pahranaagat.

From the *Salt Lake Vedette* of March 2d: A letter from Silver Cañon says:—"Times are improving. Claims are turning out better than was anticipated, and are being

worked briskly. Sebastopol is looking well; also Mary Ann and Nebraska. The New York, Philadelphia, Lansing, Mechanics and Norsell. Congar's mill has arrived and will be put up at Logan's Springs, two and a half miles from Vance's mills on the road to Los Angeles. A portion of Raymon's large mill is here; the other mill is doing well. Last week they took out 1,000 pounds of silver, yet the furnace does not work well, as the material is not suitable.

##### Reese River.

From the *Reveille* of February 19th:—On the Child and Canfield location, Silver Bend, an incline shaft has been sunk, near the north end, to the depth of 80 feet. Nine feet of the vein has been exposed. The southern incline is 505 feet from the northern incline, and is 105 feet deep. The vein is developed in the entire course of this excavation, and varies from five to six feet thick. Many large and beautiful specimens of ore have been extracted from this incline. One massive block measuring two feet long, two feet wide, and one foot thick, was presented to Col. Buel as a tribute to the Great Exposition. When these two inclines are connected by level, a magnificent body of ore will be developed—that is, the vein six feet thick will be uncovered to the depth of 100 feet and for the length of 505 feet. There are already 200 tons of ore on the dump that will certainly average \$150 per ton.

In Mammoth District, Messrs. Ferguson & Co. have continued their work on the shaft of the American Flag, which is now 130 feet deep. The owners are satisfied of the richness of their ledge, which contains nine feet of good pay ore. The Ural Company is still at work taking out ore. The Hamilton will commence operations during the coming season, having perfected their arrangements east. Work continues on the Sacramento, on which they are running to the southward and taking out good milling ore.

Important discoveries of mineral have been made in the Empire District, north of Hot Creek. The ore closely resembles that from the High-bridge.

##### Washoe.

[In the Stock Circular, in another portion of this paper, will be found late mining news from this district.]

From the *Territorial Enterprise* of Feb. 21st:—The mines discovered last fall in the red hills in the vicinity of the Truckee, about which there was so much howling at the time, are said to have proven valueless. The leads are largo enough, but there is nothing in them.

It is reported that a very promising lead has lately been struck about two and a half miles southeast of Dayton. The lead is said to be about fifteen feet in width and rich in sulphurets of silver.

Same of March 1st:—The late snow storms have laid an effectual embargo on quartz teaming and reduction. Hardly a mill in the State is now at work. There is no trouble about the supply of ore. The dumps of all our mines are full and in many mines are large stores of ore not yet hoisted to the surface. In our mines work is still going on, though the force of workmen is not so large as during the prevalence of good weather, and good roads.

A silver lead was not long since discovered, some four miles south of Carson city, by Peter Riley, one of the first workers of the Comstock. It is fifteen feet wide, and the ore assays \$21.00 in silver with a small proportion of gold. A shaft has been sunk to the depth of ninety feet, but is stopped for the present by an excess of water. The ore is said to be a sort of coarse sandstone.

Same of 6th: Yesterday Mr. Welsh of the Gould & Curry mine, at the head of a volunteer shovel brigade of 200 men, took the field against the snow, and cleared the way from the mine to the mill, a distance of nearly five miles. Nothing now prevents the transportation of ore from the mine to the mill.

Same of 7th: Letter from Belmont thus speaks of the Silver Bend Company. They are now down to a depth of about seventy-five feet, and the ledge at this point is wider than where they run through at first, while the ore is better. I am informed by a reliable person that the poorest rock he could find in the whole pile, worked in a mortar \$200 to the ton. They have now about seventy tons in this pile. It is generally conceded that this is the best rock he has ever been taken out in this district. A twenty stamp mill will be erected in the spring.

Same of 8th: The work on the New Empire-Imperial Shaft is rapidly progressing toward completion. It has now attained a depth of 825 feet. It is intended to sink the shaft 75 feet deeper—making its total depth 900 feet—when a drift will be run

from its bottom to the east wall of the ledge, which is believed to be about 100 feet distant. As soon as the shaft has reached the depth intended and a drift has been run to the east wall, machinery will be erected and the new shaft will be used for raising rock and the old hoisting works abandoned.

From the *Trepass* of Feb. 25th: The Brunswick mill, on the Carson river, below Empire, is to be entirely rebuilt, and its capacity tested.

Same of 26th: The Birdsall & Carpenter mill, at Dayton, is running on ore from the Chollar-Potosi mine, and is making excellent returns. The Illinois mill is pounding away on Yellow Jacket, and producing the usual supply of silver bars. The Dayton mill is reducing ore from the Consolidated mine, at Gold Hill. Neither of these mills will cease work if the roads are in a passable condition to permit the transportation of ore from the mines.

The Bowers & Plato dump-pile is overflowing, and the hoisting of ore has ceased for the present.

Same of March 5th: At Washoe City, the ditch of the Savage Mining Company has been covered with snow and damaged considerably, but to what extent is not yet known. The Manhattan mill has been running nearly all the time, having had some 500 tons of Savage ore in reserve. The mills of the Savage Company are working tailings. The New York and Buckeye mills and also the Temelec mill, at Pleasant Valley, have suspended work.

Same of 6th: Following are the names of the mills in Gold Hill that still continue in operation: Rhode Island, Eclipse, Sapphire and Imperial. A number of others will commence work this week, and it is expected the whole stamp power will be in operation soon.

At the office of Wells, Fargo & Co., today, we saw sixty-two sacks of hullion corded up, awaiting transportation to San Francisco. In addition to the above, there are about 150 bars deposited in the banks.

We learn that a very rich body of ore was cut in the Mexican mine, Tuesday. The ore raised yesterday, it is said, will work \$1,000 to the ton.

**REFUSE MATTER VALUABLE.**—New York city pays twenty thousand dollars per year for the removal of 500,000 cart-loads of such matter. The value of this, as a fertilizer, would be two millions of dollars. They understand these things better at "the Hague." In that city pneumatic action is employed for the removal and saving of the refuse. In each house a vertical pipe extends from the basement to the roof, from which it emerges. This has openings at the level of each floor, closed, if need be, with air-tight lids. When these are unclosed, a strong current of air enters and passes up. This pipe continued into a street-pipe ending in the reservoir beneath the pave, of boiler-iron. Each house-pipe is closed by a valve where it joins the street-pipe. A powerful, steam-engine worked air-pump, at tended by an air-tight reservoir, travels the street. The former is attached to the subterranean reservoir, and evacuates the air from the upright house-pipe. Then a floor valve is suddenly opened. The pressure of the air having forced the refuse matter to each valve, when it is suddenly opened, the rush of air drives the mass thoroughly into the reservoir. As each valve is closed and the next opened, the steam-engine continues the air-evacuating process. Afterward the tender reservoir is tightly coupled to the other, and its contents are thrown into the first by pneumatic pressure. The street engine, with its load, then retires; its contents are shipped to the nearest station, and thence placed under the surface of the soil.

**CHANGE OF LOCALE BENEFICIAL TO TREES.**—An Eastern exchange says: "It is a singular fact that some trees make a more rapid growth, and flourish better in every way, in a country quite different from their own, than in their native country. Our most rapid growing deciduous and evergreen trees are foreigners, and in California, that land of remarkable trees, an *Eucalyptus* from Australia is found to excel in vigor any of the native trees, and will probably become the leading tree of the country. In Great Britain, the *Sequoia gigantea*, the California "Big Tree," which with us is at best uncertain, flourishes remarkably. Some statistics have been published by the Scottish Arboricultural Society, giving the height and age of this species, in different parts of the kingdom. Several at the age of five years are twelve feet high, others at seven years are eighteen feet, and trees ten years old are about twenty-one feet in height.

## Mining and Scientific Press.

W. B. EWER,..... SENIOR EDITOR.

C. W. M. SMITH. W. B. EWER. A. T. DEWEY.  
DEWEY & CO., Publishers.

OFFICE—No. 505 Clay street, corner of Sansome, 2d floor.

## Terms of Subscription:

One copy, per annum, in advance.....\$5 00  
One copy, six months, in advance..... 3 00  
For sale by Carriers and Newsdealers.

**American and Foreign Patents.**—Letters Patent for Inventors can be secured in the United States and foreign countries through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We offer applicants reasonable terms, and they can rest assured of a strict compliance with our obligations, and a faithful performance of all contracts. For reference, we will furnish the names of numerous parties for whom we have obtained patents during the past two years.

**SUBSCRIBERS** who do not receive the *Mining and Scientific Press* in due time, are requested to inform the publishers.

**A Canvassing Agent** for the interior, is wanted at this office. None but a thorough and experienced man need apply.

## Canvassing Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting our Agents in their labors of canvassing, by lending their influence and encouraging favors. We shall send none but worthy men.

**Mr. A. C. Knox**, is our city soliciting and collecting Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office.

**Mr. E. W. Felton**, is an authorized agent for this paper at Portland, Oregon, Dec. 1, 1886.

**Mr. E. L. Smith**, is a duly authorized Agent for this paper, February 25, 1887.

## San Francisco:

Saturday Morning, March 16, 1887.

## Notices to Correspondents.

**W. P. R.**—Los Angeles. The most improved ice machines heretofore constructed, have consisted either of the employment of power as a condenser, and subsequently allowing the evolved caloric to escape; or more recently the evaporation of ammonia has been employed. Reports speak favorably of the latter method, and one was not long ago imported for the use of the college at Santa Clara, where it gives, as we have been informed, considerable satisfaction. There are two or three of the same class of machines in this city. They are quite small, however, having been constructed merely for experimental purposes. We do not know of any for sale. A machine to do the work you require, would cost from \$1,000 to \$1,200, without the engine to work it. We had prepared a lengthy article on the artificial production of ice for the present issue; but it has been unavoidably laid over until next week.

**SELENE.**—A volcano may exist in the moon without any necessity for an atmosphere being present; incandescence evolving intense heat and light, can be produced by many substances besides oxygen; though generally such substances are also gaseous. Many metals, however, and sulphur combine with incandescence and the evolution of light, at the melting point of the latter. The fact just stated forms one of the most pleasing and instructive experiments, illustrative of some of the phenomena connected with light and heat, and is performed as follows: Take two or three pinches of copper turnings or filings, and insert them along with about half their weight of flour of sulphur, in a small glass flask; after the above are well mixed, apply a lighted spirit lamp to the bottom of the flask. Very shortly, an intense incandescence will take place, the materials suddenly becoming red hot, a black brittle compound resulting—the disulphide of copper. It will thus be seen that the doubt thrown on the probability of an existing volcano in the moon (now thought to be apparent by some observers), by the *London Spectator* and other papers which have followed in its wake—is not countenanced, for the reason that it has usually been conceded that our satellite is without an atmosphere, and probably also devoid of water, our most familiar sources of oxygen. The illustration above given, is amply sufficient to show that incandescence and fusion, and development of light, similar to that of volcanic action, may be produced without the necessity of oxygen being present.

**A YOUNG MECHANIC.**—Friction is that resistance to motion which is principally caused by the adhesion which occurs between bodies of all kinds when in contact, and is more specially developed between solid bodies. As a general rule, friction is greater between similar kinds of matter, less between those of a different character. This is the reason why an iron axle moving in an iron socket experiences, under similar conditions, a greater amount of friction than if revolving in a brass socket. The interposition of substances like plum-bago or grease, the particles of which have very little cohesion, is a mode of reducing the amount of friction in machinery, which must be familiar to you.

## The Pacific Rolling Mills and Forge Company.

One of the most important enterprises connected with the industrial progress of this city, is that named at the head of this article. It is an enterprise which has long been needed, and those of our citizens who are engaged in other departments of industry connected with iron, and in mining and manufacturing operations, cannot but feel thankful to the enterprising gentlemen who have taken this matter in hand with an energy and zeal which augurs well for the future.

Iron manufacture lays at the foundation of all industrial pursuits; it constitutes the bed-rock upon which every other enterprise of human ingenuity and human industry rests. Without it, we could conduct neither mining, mercantile or manufacturing interests, or any considerable mechanical operations. It goes hand in hand with civilization, which, of itself, could not exist without it.

One of the earliest mechanical efforts on this coast, in 1849, while San Francisco was yet but little better than a small collection of tents, was the improvisation of a blacksmith shop and foundry, which was set up under a tent on the beach, by Peter and James Donahue, near where they afterwards built the present Union Foundry. From that time to the present, the iron manufacturing interest has gone on increasing from year to year, until it now numbers some forty machine shops and twelve foundries in this city alone, giving employment to over 1,000 hands, and directly or indirectly supporting not less than 4,000 people. The importation of pig iron in 1860 was but 2,439 tons. This importation has gradually increased, until it has reached 9,730 tons in 1866. The importation of wrought iron has kept equal pace with that of pig iron; but, owing to its being invoiced by packages instead of by weight, we are unable to give the exact amount.

The greatest drawback to the further and more profitable increase of the iron interests here, is the present dependence upon the East for the raw material of pig iron for the foundries, and of round and square iron for all the various manufacturing purposes of our machine shops. Our distance from the source of the raw material, and the uncertainty which constantly exists of the classes of iron *in transitu*, keeps prices in a constant state of demoralization; so that it is unsafe to make large contracts, or contracts at all, for any distant future delivery, beyond the capacity of the stock on hand.

The importer, in order to meet the demands of his customers, must keep heavy stocks in store, and even then often finds himself unable to deliver particular descriptions of iron, and much loss is often entailed, either upon the seller or buyer, by reason of the necessity of working unsuitable material, or such as works to waste, without any possibility of utilizing the waste, except by sending it 20,000 miles away, to be worked into desirable forms, and re-transported the same distance back again.

The Pacific Forge Company, which went into operation about a year ago, has partially remedied this evil, and has already saved large amounts to the State by the facilities which it has afforded for furnishing just the size of material needed, and for utilizing scraps which have heretofore been thrown away or sent to the East to be re-worked.

This company has recently been merged with the original Rolling Mill Company, and the united enterprise is now known as the "Pacific Rolling Mill and Forge Company." The company is now actively engaged in preparing its grounds and buildings upon Potrero Point, adjoining North's ship yard. The ground will be graded, and the building made ready to receive its machinery, by the first of August. The machinery is all purchased, and is now on its way to this port. The first shipment will be due

in April, and the balance will follow closely after.

The most modern and approved class of machinery has been purchased; such as will enable the company to make all sizes of iron, from  $\frac{1}{4}$ -inch to 24 inches, both round and square. Sizes of iron three to four inches will be rolled; all over that size will go under the hammer. Flats will be rolled up to nine and ten inches wide. The company will be prepared to forge shafts for steamships, and other like purposes, should occasion require, up to 36 inches—larger, even, than any now employed on the Panama steamers.

Machinery will be set up for making railroad iron from forty to fifty-six pounds. These rolls have been constructed with special reference to making such rails as are employed in the construction of the Pacific Railroad. They will also make street rails, rails for tramways, etc. Suitable machinery will be procured, at an early day, to roll boiler and other plate iron, for shipbuilding, etc. It is the intention of the company to keep fully up with the requirements of this coast in everything pertaining to heavy iron manufacture.

A puddling furnace will be put up as soon as it is found that such a furnace can be supplied with the raw material. Every encouragement will be given to the production of native iron.

The company will look for its present supply from such scraps as can be purchased on this coast, making up the deficiency by importing Norway, Sweden, English and Scotch blooms. Forging of all kinds, for steamship and mining purposes, for locomotive and car axles, are now being made at the company's temporary works, on Mission creek, near the San Jose Railroad machine and repair shops.

**MUNIFICENCE.**—George Peabody has given \$150,000 for the foundation and maintenance of a Museum and Professorship of American Archaeology and Ethnology, in connection with Harvard University. Also, the same amount for the foundation and support of a Museum of Natural History, especially of the Departments of Zoology, Geology and Mineralogy, in connection with Yale College. Also, \$500,000 to the Peabody Institute, established by him at Baltimore; making its present endowment one million dollars. He has also increased to \$250,000 his previous gift to the Peabody Institute, in his native town of Danvers, Mass. He has given \$25,000 to Phillips' Academy at Andover, Mass., and the same amount to Kenyon College, Ohio. Other gifts swell the amount to about two millions.

What a contrast between this princely giver, and those millionaires who hoard and hoard throughout a long life—content to be known only as the richest men of their day and generation—and finally pass off the stage, leaving wills to be quarrelled over by the trustees of benevolent institutions, and wealth to be squandered by fast young heirs! George Peabody gets the worth of his money. He is honored and blessed by thousands; and will be remembered when Astor is forgotten.

**STEEL MADE IN ONE DAY.**—Mr. Savage, of Meriden, Conn., has taken out a patent for the manufacture of steel by immersion in a chemical solution. A company is being organized in the above named place for carrying on the business. The process is claimed to have these advantages: First, it takes only one day, instead of fourteen; second, the steel is uniform in quality; third, there is for this reason no loss, consequently it can be made at a cheaper rate than by any other process.

**SCIENTIFIC TOYS.**—The latest is the "parlor steam-engine." Scented water is used; and while one studies the mechanism of the engine, he is regaled in the meantime with a most fragrant perfume.

## Desulphurization—Oliver's Process.

We have several times alluded to the fact that a person named Oliver has lately been selling, in Nevada and Placer counties, "receipts" for a "new process" for desulphurizing auriferous sulphurets. A late number of the Nevada *Gazette* says, that the process consists in mixing with the pulverised sulphurets a certain quantity of the following mixture:—94 parts of slacked lime and 6 parts of carbonate of soda. After roasting (the length of time not given) the mass is thrown into salt water, slightly acidulated with muriatic acid. The quantity of the mixture to the ton of sulphurets is not given.

We cannot see anything either new or valuable in the treatment. A better thing would be unslacked lime and nitrate of soda. Unslacked lime is better than slacked, because it will combine more readily with the sulphur, which must be its only value. Nitrate of soda is better than carbonate of soda, because the former contains double the quantity of oxygen which the latter does, and it moreover costs less than half as much. The only advantage of either consists in the readiness of their decomposition, to form with the sulphur, a sulphate of soda. In either case, as well as in cost, the nitrate possesses twice the value of the carbonate.

The lime will probably be disadvantageous in any shape, from the fact that when silicic acid is present, (as it always will be in large operations,) in the great heat necessary for throwing off the last equivalent of sulphur, it will form a silicate of lime which will coat the gold so as to prevent its amalgamation. Immersion in acidulated liquor, as is done in Oliver's process, will not remove the silicate. Trituration will with difficulty do it.

This is one of the disadvantages which often arises from roasting auriferous ores in open heaps. Whenever lime is present in the rock, the excessive heat in the central portion of the heap will be sure to form silicates, which will so enfil the gold as to render a thorough amalgamation almost impossible, except by long continued trituration.

Perhaps Oliver's process may work well in the laboratory, where the heat can be kept under control and the process carefully watched; but we believe that experience has hitherto shown that such processes (for they are not new) are not practical on a large scale, with or without modifications.

The saving of time and fuel will not be equivalent to the increased cost of the chemicals and the increased manipulation in their use. If the experience of any person should warrant a different conclusion, we should be happy to hear from him.

**A NEW PRESSURE BLOWER** for cupola furnaces, forges, rolling mills, ventilation, or for any purpose requiring a powerful blast, may be seen at Marsh, Pillsbury & Co.'s, corner of Front and Pine streets, who are agents for the same. It bids fair to supersede the piston and other blowers heretofore used. Being exceedingly simple in construction, it is said to be noiseless while in operation, and being protected from dust and dirt, is very desirable. Economy in point of power, strength of blast and other advantages, are claimed for it by B. F. Sturtevant, the manufacturer at Boston. We may have occasion to refer to it again.

**ANOTHER SCIENTIFIC MAN GONE.**—Dr. Livingstone, the African explorer, is reported by telegraph, to have been killed by the Kaffirs. He was a self-made and self-taught man. He has spent most of his life since 1840 in Africa. He was the first European who visited the great central lake Ngami; and after his return in 1849, from the expedition, was elected a member of the Royal Geographical Society, of London. No man has done so much to make us acquainted with Southern Africa. His loss will be deeply felt.

## The Labor Question—Co-operative Associations.

The labor question, which is causing a vast amount of uneasiness and bad feeling in this country, seems to be fast working out its own solution in England. Combinations for regulating the rate of wages, and fixing the hours of labor; and "strikes," which so frequently, and most generally, in fact, aggravate the very distress which they were intended to relieve, are there giving place to co-operation associations. The former are founded on a wrong principle, and from the very nature of things, are unwise and inefficient; nay, they often lead to criminality and disgrace. Not so with the latter. The co-operative association is wise, prudent, altogether loyal and effective. It is, in fact, the true remedy, always within the reach of the working man, by which he may effectually and fully protect himself against the combination of capital, in any and all of the phases, which cupidity may suggest, to control, either labor or the products of labor, at the expense of working men and consumers.

Co-operative association is now an institution, in England, and a power in the land. Its influence is felt and acknowledged by the most influential capitalists, even in a country so famous as England is for its "solid men." It reaches out its arms wherever moneyed oppression is felt, and lays a heavy hand upon the oppressor's head. Is there a combination to advance the prices of the necessities of life—a thousand or five thousand men combine, and with only a hundred dollars each, a fund is raised sufficient to go to other markets, if needs be, and supply the associated members at cost prices. Do the manufacturers of cotton, of woolen, of iron, or of any other of the products of labor, combine to put down wages and run up goods, so as to realize an unjust profit for capital over the wages of labor; the co-operators come in, build a cotton factory, or put in operation any other branch of business, furnish employment to the members of the association, paying them therefor the full earnings of their labor, minus a moderate charge for intelligent direction.

So successful have these associations become in England, that many of the large private establishments there are converting their individual operations into semi-co-operative associations—taking their workmen into quasi partnership; charging them a fair equivalent for the capital invested and superintendence of the same, and dividing with them all profits in excess. Many of these arrangements are found to work better for the proprietors than under the old system—the half profits, over interest, coming to the proprietors, being greater than the entire profits over the workmen, who had no pecuniary interest in their labor other than their stipulated wages.

An association of this kind is in existence in Rochdale—the home of Bright and the late Mr. Cobden—which numbers 5,500 members, with a capital of \$360,000. In all England there were reported, for last year, 417 such associations, whose paid up capital was a little short of \$4,000,000, but whose valuation of property was estimated at \$7,500,000, upon which a profit was divided for the year previous of not less than \$1,400,000!

Let the working men of America, and especially of California, ponder well these figures, and see if they cannot find in them a solution to the labor question which is just now creating so much feeling in this State. True, most of these associations in England are confined to buying and selling goods, but they are equally applicable to any business in which any one or more persons can engage.

Movements in this direction have been commenced in several of the Atlantic cities. A large iron establishment is about going into operation, or has already started, in Troy, N. Y. A cotton factory, with a capital of \$250,000, in shares of \$100 each, is about to be started in Fall River, Massachusetts. About half of the stock of this latter has been taken in small sums of \$200 and upwards.

There is no reason why many branches of business cannot be started in this State on the same principle. There will always be found capitalists in every community who will help along efforts of this kind undertaken by the masses. Thus has the laborer within his ready reach one of the most effi-

cient means for providing labor for the unemployed, and for securing a fair return of reward for the same. It is by far the best means of protection against the oppression of capital or the extortion of speculators. It is better than "strikes," better than "regulating" combinations. It runs counter to no law, human or divine. Let the working men of this State and of this city think of it. By a proper adoption of this plan, and a faithful carrying out of its conditions, they will not only provide themselves with present employment, but lay the foundations for future prosperity, and greatly aid in building up a healthy, prosperous and populous Empire of labor and capital on the Pacific slope.

**SOMETHING NEW IN THE PHOTOGRAPHIC ART.**—By our Eastern exchanges we observe that they are having a new sensation in the photographic art, by the adoption of a size and style of picture which seems destined to supplant the universal *carte de visite*. The October number of the Philadelphia *Photographer* (devoted exclusively to the photographic art) describes the size and advantages of the new picture in glowing terms, while the January number gives as an illustration a lady photographed from life in the new style. They are called the "Cabinet Photograph," and have albums, show cards, frames and envelopes, of a suitable size to receive them. They are already taken by our leading photographers in San Francisco in considerable numbers, and Mr. Shew, 612 Clay street, is devoting especial attention to them.

**STEEL RAILS.**—Their great durability is not the only advantages possessed by steel rails over iron ones. The interruption of the line consequent upon re-laying them, is not more than one-fifth that involved in the re-laying of iron rails. Again, they will bear much greater loads without breaking. When we speak of steel rails, we assume that they are made under a contract by which any bar, taken at random, must withstand the weight of a blow of one ton falling twenty-five feet, the rail being laid upon three feet supports. Steel rails may be taken up during a hard frost and bent double under a steam hammer without breaking, although steel that would stand this test without cracking would be somewhat softer than would be desirable. The test by a ton weight on 25-feet fall should be enforced under all contracts for steel rails. Any good steel rail will withstand it perfectly, while an iron rail would be broken with the same weight on a five feet or at most a ten feet fall. One thousand tons of Bessemer rails are now made weekly in England and Wales, and probably 400 tons on the continent. *Engineering* says: "We cannot doubt that the time will come when iron rails will be obsolete, just as the old cast iron trams, and after them the fish-bellied rail passed out of existence."

**WHEAT SOWING.**—We would call the attention of our readers, especially those interested in farming, to a communication by Prof. Rowlandson on the subject of "Wheat Sowing," which will be found in another column. As many of our readers are not aware of the high standing which the Professor holds in Europe, in the department of scientific agriculture, we would state that in addition to being the author of a number of well known treatises—from irrigation to lime, as connected with agriculture,—he has also obtained from the Royal Agricultural Society, of England, more prizes for essays than any other person. He has received eight prizes, while no other person has succeeded in obtaining a larger number than three.

**LEATHER FOR JAPAN.**—The beneficial effects of the opening up of trade with Japan is beginning to develop some quite unexpected benefits. It is stated that a ten thousand dollar order has already been received in this city for California leather from Yokohama.

A LONDON telegram, March 11th, says: Artemus Ward directed in his will that his property, after the death of his mother, shall go towards the erection of an asylum for printers.

## Steam Carriages on Common Roads.

BOISE CITY, I. T., Feb. 22, 1867.

**EDITORS MINING AND SCIENTIFIC PRESS:** In late issues of your paper, I noticed some remarks regarding "Steam Carriages for Common Roads." For the information of those who suppose this to be an entirely new invention, I would add my remembrances. About the year 1838 (I was a mere child). I well remember to have frequently seen, at St. John's wood, near London, England, a steam coach on the common roads. In appearance it somewhat resembled an "old fashion" stage coach. The inventor was Nathaniel Ogle, and the carriage was owned by him and Wm. Martin. With this machine, Mr. Ogle, accompanied by my father and aunt, and one or two other friends, made a successful trip from Southampton to Liverpool, a distance of over two hundred miles. The only accident of any importance on the trip was caused by the fracture of a brake; whereby the machine, in descending a steep hill, ran over a donkey cart, smashing the cart, killing the donkey, and badly scaring the man. Damages about \$40. Prejudice was the great cause of their non-success. I am your obedient servant, HERBERT W. O. MARGARY.

**TO FIX PENCIL WRITING.**—Pencil writing may be fixed almost as indelibly as ink, by passing the moistened tongue over it. Even breathing slowly over the lines, after writing, renders them much less liable to erasure than when not subjected to that process. This fact may be of importance to persons who may wish to carry a memorandum book for a long time. In ordinary use the pages of such a book often become very much defaced by the erasure and diffusion of the pencil marks, over the entire surface of the paper. A trial of the experiment will readily satisfy any person of the utility of the idea.

**NEW BARREL.**—At the meeting of the Polytechnic Association on January 24th, a barrel for holding coal oil was shown, made of twelve or fourteen successive layers of white oak strips laid over spirally around a mold, and held together with glue. It is tight, light and strong; and can be put into market at one-fourth the cost of any petroleum barrel now in use.

The three gold-bearing belts in the United States, are the "Appalachian Gold Field" (including Virginia and North Carolina), the "Rocky Mountain Gold Field," and the "Sierra Nevada Gold Field."

THE SUEZ CANAL is practically opened to commerce. Large steam tugs have already passed through, bearing the products of Asia into European waters.

**AN AGED SHIPBUILDER.**—Mason Barry, of North Swansea, Mass., now eighty-five years old, built 137 ships before he retired from active life. He was in the business forty-two years.

**CAOUTCHOUC** will, it is said, supersede gutta percha as an insulator for submarine telegraph wires. The latter gradually softens and decays.

**OCEAN TELEGRAPH CHARGE.**—Since the reduction of tariff on the Atlantic cable, on Nov. 1st, 1866, the receipts have been at the rate of \$1,400,000 per year.

**MAIL STEAMERS FOR THE SANDWICH ISLANDS.**—Mr. McRuer's bill provides for twelve round trips annually for ten years, at an annual subsidy of \$75,000.

**National Mineral Land Law, Instructions.** Blanks, Etc.

Copies of the Act of Congress, approved July 26th, 1866, relating to the Location of Mineral Lands, together with the instructions to the "United States Registers and Receivers and Surveyors General," from the Commissioner of the General Land Office Department of the Interior, dated at Washington, Jan. 14th, 1867, can be had at this office. Also a full set of blanks for making applications, advertising, etc. Address DEWEY & Co., office Mining and Scientific Press, San Francisco.

**Builders' Insurance Company—**  
OFFICE IN THE BUILDING OF THE  
CALIFORNIA SAVINGS BANK, California  
street, one door from Sansome street.  
FIRE AND MARINE INSURANCE. 10v145pqr

## A Paying Newspaper for Sale.

A one-half interest in one of the best Country Papers in the State, is offered for sale on desirable terms. The journal is the oldest in the county, is situated at the County Seat, and surrounded by one of the most prosperous and promising Quartz and Gravel Mining Districts in the State. Inquire at the office of the *Mining and Scientific Press*; or address DEWEY & VAUGHN, Mountain Messenger office, Downsville, Sierra County, Cal. 7v141f

## To Capitalists.

**GOLD QUARTZ MINE, SITUATED IN CALAVERAS COUNTY,** with steam mill fitted up with Amalgamating Pan, &c. FOR SALE. The mine has three main veins, and more than \$84,000 have been spent in opening them and completing the mill. Good wagon roads all the way. Apply to BELLOC FRERES, Bankers, 635 Clay street, San Francisco. 23v13-6m

## Quartz Mill Construction and Superintendence.

THE UNDERSIGNED IS AT PRESENT OPEN FOR AN engagement as a working Superintendent in the construction or operation of a Quartz Mill. Has had five years steady and successful experience in working ores in Washoe, and is practiced in saving sulphurets and the treatment of rebellious ores. Is prepared to furnish references for all the necessary qualifications of an intelligent, faithful and reliable quartz operator. Address F. M. SHAW, San Francisco, care Mining and Scientific Press. 10v14-3m

## Nitro-Glycerin!

WE ARE INFORMED THAT CERTAIN PERSONS ARE using, offering to manufacture and sell Nitro-Glycerin, to be used for Explosions in Oil Wells, blasting or other purposes.

This is to notify the public that the United States Blasting Oil Company is the sole owner of the Nobel Patent for manufacturing Nitro-Glycerin, and for exploding the same; and that any and all infringements of the Company's rights will be prosecuted in law.

The Company is now prepared to supply any desired quantity of the best quality of Nitro-Glycerin to the public, with instructions how to use it and avoid accidents. Orders to be addressed to JAMES DEVEAU, Secretary, 32 Pine street, New York.

**T. P. SHAFFNER,**  
President U. S. Blasting Oil Company.  
32 Pine street, New York.  
11v14-1m

## SAN FRANCISCO Cordage Manufactory!

CONSTANTLY ON HAND A LARGE ASSORTMENT

## MANILA CORDAGE,

Whale Line, Bale Rope, etc.,

Manufactured from Pure Manila Hemp.

Office, at TUBBS & CO'S, 611 and 613 Front street.  
Manufactory at the Potrero. 11v14-1q

## PACIFIC Rolling Mill and Forge Co., SAN FRANCISCO, CAL.

Established for the Manufacture of

## RAILROAD AND OTHER IRON

## Every Variety of Shafting,

Embracing ALL SIZES of Steamboat Shafts, Cranks, Piston Connecting Rods, Car and Locomotive Axles and Frames.

## HAMMERED IRON

Of every description and size.

Orders addressed to PACIFIC ROLLING MILL and FORGE CO., Post Office, San Francisco, Cal., will receive prompt attention.  
The highest price paid for Scrap Iron. 9v143m3p

## A. S. Hallidie & Co., MANUFACTURERS OF FLAT & ROUND WIRE ROPE.

For Mining, Shipping, Ferry,

AND GENERAL PURPOSES.

Office—412 Clay street. . . . . Works—North Beach  
SAN FRANCISCO.

**NOTICE.**—THE FIRST COST OF WIRE ROPE IS MUCH less than that of any other kind of Rope of equal strength, and it is four times as durable. Wire Rope does not stretch or shrink by atmospheric changes; it has but one-fifth the bulk of Hempen Rope; is spilled and repaired in the same manner.

The attention of Mining Companies is particularly called to our Flat and Round Hoisting Ropes, which have been in use for a number of years by the leading mines on this Coast, and many of whom we refer those interested as to the great advantages over any other kind of rope; effecting a immense saving in expenditure for ropes, fuel, wear and tear of machinery, stoppage of works, etc., besides increasing safety of life.

Mining Companies, in erecting Hoisting Works, should be sure and have their drums and pulleys of sufficient size, whether for wire or hemp rope.

We manufacture of all sizes, and in any length—

**Round Wire Rope**—Iron or Steel, for Hoisting.

**Flat Wire Rope**—" " "

**Soft Steel Wire Rope**—For Derrick Fall Ropes—

very strong and durable—one third the weight of hemp of equal strength, (saving in freight for remote localities). Suitable sheaves and blocks furnished when required.

**Galvanized or Ungalvanized Round Wire Rope**—For Ships' Rigging, Derrick Gays, Ferry Ropes, and all standing purposes.

**Steel Ferry Ropes**—For wide streams. Ferry Blocks supplied.

**Iron and Copper Wire Cord**— $\frac{3}{4}$  to  $\frac{1}{2}$ -inch diameter, for hanging window shades; signal cord; Sash Pulleys on hand.

Comparative Weight, Size and Strength of Iron Wire Rope, Steel Wire Rope, Hemp Rope, and Chain.

Iron Wire Rope.	Steel Wire Rope.	Hemp Rope.	Chain.	Equivalent Strength.

Pamphlets containing data, with prices annexed, forwarded free, by mail or express, on application to manufacturers. 23v13-6m3p				

Established in 1849--Corner First and Mission streets, San Francisco.

HAVING INCREASED OUR FACILITIES IN EVERY DEPARTMENT, WE ARE NOW prepared at the shortest notice and at the most reasonable rates, to furnish all kinds and description of Machinery, including Steam Engines, Quartz Mills, Mining Pumps of all kinds, Hoisting Gear, Gas Work, Laundry Machinery, Architectural and Ornamental Castings, Sugar Mills, Saw and Flour Mills, Water Wheels of all kinds, Hydraulic, Hay, Rag, screw and Drop Presses, Coining Machinery, Pile Drivers, Bark and Malt Mills, and all kinds of Castings.

**ENGINES.**—Marine Engines, Oscillating and Beam; Stern and Side Wheel Boats, Locomotives, Stationary Engines, Horizontal, Upright, Oscillating and Beam, from six to fifty inches diameter. Also, Scott & Eckart's Adjustable Cut-off Regulator—best in use; W. E. Eckart's Balance Valve for Stationary Engines; Woodward's Patent Steam Pump and Fire Engine.

**BOILERS.** Locomotive, Plate, Tubular, Upright, Cylinder and Cornish, and every variety of Boiler Work. All sizes of tubes and pipes for pumps.

**PUMPS.**—The Excelsior double-acting Force Pumps are manufactured by us. These very superior Pumps are warranted the best, and are fast replacing all other Force Pumps.

**AMALGAMATING MACHINERY.**—Wheeler & Randall's Improved Tractor Curve Pan, Zenus Wheeler's Improved flat bottom pan, Beidin's pan, Veatch's tubs, Frater's concentrators, Wakley's pans, Beers' pan, German Barrels, Arista Oaring, Chile Mills, Scissors of all descriptions, Reclorts of all sizes and shapes, for Silver and Gold, Portable Stamp Mills, Straight Batteries, for wood or iron frames, Dry Crushing Batteries, or machines with the latest improvements, every variety of Stamps, Mortars, Cams, Pans and Tubs. BLAKE'S PATENT QUARTZ CRUSHERS, of all sizes.

**OIL BORING TOOLS AND MACHINERY.**—Of the latest and most approved construction, made from drawings lately made by Prof. Blake at the oil wells in Pennsylvania. We have the facilities for working gold and silver quartz and other ores, to test their value, by the hundred weight or ton.

Russia Iron Screws, of all degrees of fineness and of all qualities of iron. All work done in the best manner at the lowest cash prices.

H. J. BOOTH, 24v12  
GEO. W. PRESCOTT, IRVING M. SCOTT  
H. J. BOOTH & CO.

### Machinists and Foundries.

**PALMER, KNOX & CO.,**  
**Golden State Iron Works,**  
Nos. 19, 21, 23 and 25 First Street,  
SAN FRANCISCO.

MANUFACTURE ALL KINDS OF  
**MACHINERY,**  
**STEAM ENGINES AND QUARTZ MILLS**  
DUNBAR'S IMPROVED  
**Self-Adjusting Piston Packing,**

Requires no springs or screws; is always steam tight; without excessive friction, and never gets slack or leaky.

**WHEELER & RANDALL'S**  
**NEW GRINDER AND AMALGAMATOR**  
HEPBURN & PETERSON'S

**AMALGAMATOR AND SEPARATOR,**  
**Tyler's Improved Water Wheel,**

Giving the greatest power, at lower cost, than any Wheel in use. There are over 1,500 running, giving universal satisfaction.

**KNOX'S AMALGAMATORS,**  
WITH PALMER'S PATENT STEAM CHEST,  
Superior for working either Gold or Silver Ores.  
**Genual White Iron Stamp Shoes and Dies**

Having been engaged for the past eight years in quartz mining, and being conversant with all the improvements, either in Mining or Milling, we are prepared to furnish, at the shortest notice, the most perfect machinery for reducing ores, or saving either gold or silver. 13v10ay-1f

**WILLAMETTE IRON WORKS,**  
**PORTLAND, OREGON.**

**Steam Engines, Boilers,**  
**SAW AND CRIST MILLS,**  
MINING MACHINERY, WROUGHT IRON SHUTTER WORK, AND BLACKSMITHING IN GENERAL.  
Corner North-Front and E streets,  
18v13-1y One block north of Couch's Wharf.

**UNION IRON WORKS,**  
**Sacramento.**

**WILLIAMS, ROOT & NEILSON,**  
MANUFACTURERS OF

**STEAM ENGINES, BOILERS.**  
And all kinds of Mining Machinery.

Also, Hay and Wine Presses made and repaired with neatness, durability and dispatch.  
**Dunbar's Patent Self-Adjusting Steam Piston**  
**PACKING,** for new and old Cylinders, manufactured to order.

Front Street, between N and O streets,  
14v11 SACRAMENTO CITY

**JOHN WRIGHT,**  
**Pick Manufacturer,**

No. 229 Fremont street, between Howard and Folsom,  
SAN FRANCISCO.

Has always on hand a general assortment of PICKS for Quartz and Surface Mining.  
Particular attention is called to his RAISED EYE QUARTZ PICK, which is especially adapted to Quartz Mining, and guaranteed to give good satisfaction. 19v13-y

**GEORGE T. PRACY,**  
**MACHINE WORKS,**  
Nos 109 and 111 Mission street, between Main and Spear,  
SAN FRANCISCO.

**STEAM ENGINE, FLOUR AND SAW MILL**  
And Quartz Machinery, Printing Presses,

—AND—  
MACHINERY OF EVERY DESCRIPTION MADE AND REPAIRED.

Special attention paid to Repairing. 24v3-3

**SAN FRANCISCO**  
**Foundry and Machine Works,**

N. E. Cor. Fremont and Mission streets,  
Manufacturers of

**Marine and Stationary Engines**  
Quartz Machinery, Saw, Flour and Sugar Mills, Mining Pumps, Hoisting Gear, Agricultural Implements, etc.

—ALSO—  
**Wine, Cider, Cotton and Tobacco Presses**  
of the latest Improved Patterns.

**STEAM ENGINES AND BOILERS,**  
Of all sizes, constantly on hand: Quartz Mill Shoes and Dies warranted to be made of the best white iron.

**D. CAMERON.**

6v12-1y

**SPONTANEOUS COMBUSTION OF LINSEED OIL AND SAWDUST.**—The following circular has been issued from the Ordnance Office: "Brevet Brigadier General Hagner having reported the occurrence of a well authenticated case of spontaneous combustion at Watervliet Arsenal, it is deemed of sufficient importance to communicate the attendant circumstances for the information of ordnance officers. This combustion resulted from the spreading of sawdust instead of sand, as was ordered, on some linseed oil which had leaked from a barrel. The sawdust, thus mixed with oil, ignited spontaneously in twelve hours in a cellar where it had been placed in a box, but was discovered, and extinguished by the fire engines without doing any damage. The temperature of the cellar was thirty-six degrees, indicating that spontaneous combustion in a mixture of linseed oil and sawdust, may occur at a low temperature.

**A PATENT LAW QUESTION.**—Judge Lott, of the New York Supreme Court, has decided that a manufacturer taking license from a patentee is subject to the rule *caveat emptor*, and cannot recover license fees or royalty paid by him on the ground of invalidity of patent, unless intentional fraud on the part of the patentee can be shown. The *Scientific American* thinks there is enough to be said on both sides to make it a nice question.

A COAL VEIN has, it is said, been discovered near Walla Walla.

of Mr. LOCHHEAD, who has been in the business in San Francisco for the last fourteen years, and enjoys the reputation of having built ONE HUNDRED AND SEVENTEEN STEAM ENGINES.  
Screw Propellers of all kinds, and Steam Boat Machinery generally, made to order, and warranted to give perfect satisfaction in every particular. 15v12-3m

**OUT OF THE WOODS.**—The Reese River Reville, of February 22d, thus jubilates: "Now is the winter of our discontent made glorious summer by the bright prospect dawning upon us! It is the coming summer of the great east, and the fruitful season will be perpetual. It is not alone upon our mines of silver and gold that we shall depend upon our prosperity, but also will be added to those great sources of wealth a vast area of agricultural and grazing lands, facilities for manufactures, adaptability of the country to railroad transportation, and the immense quantities of other minerals, as copper, iron, soda, salt, alum, sulphur, arsenic, etc., all of which will eventually add to our products and exports and give employment to a vast population. The superior order of our gold and silver veins is now become an established fact, and also that even our smallest veins can be made remunerative to well directed labor. Who, then, can make a calculation as to the brilliant future, or place a limit to our population and wealth? The amount of arable land in the great east far exceeds the general estimate founded upon the observations of passing travelers or the dust choked passengers by stage between this city and Virginia. The fine crops of grain and vegetables, the fat beef that graces our markets, and the well conditioned cattle of the many teams, attest the virtues of a much derided soil that has been too early condemned without a fair investigation. Agriculture upon the "deserts" of Nevada will become the second great interest of the State."

**BARRELS WITHOUT STAVES.**—Parties in New York have recently invented and put into operation the manufacture of barrels without staves. These barrels are made of ten or fifteen thicknesses of veneering, or scales, cut from any suitable timber. These run spirally across each other at right angles, and are fastened together with glue. The hoops are on the inside; the head slips down upon a hoop with which it forms half of a dovetail joint, and is secured by cement; the head and shell of the barrel previously having been turned in a lathe. These scales or veneers are cut by a machine which is said to cost less than \$1,000; and will cut from sixty thousand to seventy thousand a day; thirty of them are cut from an inch board, and any kind of timber will answer—pine, beech, spruce, etc. The cost is one-third less than a common barrel, and they can be made rapidly. These barrels have straight sides. It is claimed that they will hold petroleum and alcohol better than iron, and that they can be used for any purpose required of any other vessel. Specimens of this work have been exhibited before the American Institute, where they elicited much commendation.

**WATERVILLE COLLEGE**, in Maine, has changed its name, and hereafter is to be styled "Colby University," named after its greatest donor, Gardner Colby. A new building for a chapel, library and memorial hall is soon to be erected.

**To Owners of Copper Mines and Smelting Works.**

## Practical Mining School,

Bryant Street, Between Third and Fourth,  
SAN FRANCISCO.

THE Proprietors are at all times prepared to work or test  
Ores sent to this establishment—either in large or small  
quantities—by such process as may be found best adapted to  
their chemical character, after a careful analysis has been  
made. Test lots of Ore adapted to the smelting process at-  
tended to. Sulphuret, pyritous, and the so-called "rebel-  
lious ores," are having especial attention paid to their suc-  
cessful treatment. Assaying in the humid and dry way.  
Also, roasting by cupellation, done at moderate rates.

## PRACTICAL MINING SCHOOL.

The proprietors—encouraged by numerous applications  
from gentlemen desirous of pursuing the study of practical  
metallurgy—have concluded to admit parties on reasonable  
terms. Having in their Mill all the necessary appli-  
ances for crushing, roasting, amalgamating, smelting,  
refining and assaying, as also a well extended Laboratory for  
the analysis of Ores and Minerals, a good opportunity is  
here offered to acquire a sound practical knowledge of the business.

S. P. KIMBALL,

J. R. MURPHY.

## MOSHEIMER'S

## Metallurgic Works

And Practical School for Assaying  
and Metallurgy.

THE UNDERSTOOD HAS REOPENED METALLUR-  
gic Works, and is prepared to reduce any kind of Ores,  
by Smelting, Amalgamating, or other processes, that the  
nature of the ore may require.

Practical instructions given in Assaying, all branches of  
Metallurgy and Technology.

Furnishes Plans and Estimates for the erection of Quartz  
Mills, Smelting and other Reduction Works.

Having carefully studied the science of Concentrating  
Ores, I can offer better concentrating machinery than any  
in use in California, and especially such as will save the  
fine or floating gold and sulphurets.

dition good as new, which will be sold cheap, or exchanged  
for a good Hand-Press of medium or large size.

## DEWEY &amp; CO., Job Printers,

Office, 505 Clay street.

IRON CASTINGS may be mended by mak-  
ing a mold of sand, which has an outlet  
about the ends of the broken portions, and  
pouring in melted iron, until the edges be-  
come fused. This is known by feeling with  
an iron rod. The outward flow of iron is  
then stopped, and it is allowed to fill the  
vacant space.

A MAMMOTH CIRCULAR SAW.—The em-  
ployees of the American Saw Company's  
works at Trenton, New Jersey, on New  
Year's day, were served with a dinner set  
out upon a saw twenty-two feet in circum-  
ference, made at that establishment for the  
Paris Exposition.

CUSHIONS FOR HORSE SHOES.—Horses  
used upon the Boston cobble-stone pave-  
ments, are now furnished with an India-  
rubber cushion placed between the shoe and  
the hoof.

A NEW OCEAN TELEGRAPH.—Senator Rum-  
sey, from the Post Office Committee, has  
reported favorably on the bill authorizing  
the Atlantic Telegraph Company of New  
York to make soundings and lay a cable  
from America to connect with France.

In making a butt joint in belting, use  
the punch and not the awl. The hole does  
not tear.

## SAN FRANCISCO ASSAYING

—AND—

## REFINING WORKS,

No. 410 Montgomery Street,  
Successors to KELLOGG, HEUSTON & CO.

## CAPITAL STOCK, \$1,000,000.

DIRECTORS:

JOHN PARROTT, CHAS. E. McLANE,  
WM. C. RALSTON, A. HAYWARD,  
LOUIS A. GARNETT, LOUIS A. GARNETT.

LOUIS A. GARNETT, President and Manager.  
JOHN HEUSTON, JR., Chemist and Supt.

THIS COMPANY, HAVING GREATLY ENLARGED  
their Refining Works, and introduced many other im-  
portant improvements, are pleased to announce that they  
feel warranted in again reducing materially their terms of  
doing business.

## The Tariff of Charges

Which they now submit to the public—considered with  
reference to the cost of material and labor—is lower than  
in any other part of the world, and secures to the mining  
interest of this coast an important increase in both the min-  
ing and commercial value of bullion. Their charges here-  
after will be as follows:

## For Assaying Deposits for Unparted Gold Bars.

One-eighth of one per cent. (herefore a quarter) for all  
amounts over \$1,000, and two dollars for any smaller sum.  
Returns made in twenty-four hours.

## For Assaying Deposits for Unparted Silver Bars.

Two dollars for the gold contained, up to \$1,000, and one-  
eighth of one per cent. for all amounts over that sum, and  
one per cent. on the silver contained. Returns made in  
twenty-four hours.

## For Refining Deposits made for Coin or Fine Bars.

On bullion under 300 parts gold, 2 cents per ounce.  
On bullion from 300½ to 600 parts gold, 4 cents per ounce.  
On bullion from 600½ to 750 parts gold, 6 cents per ounce.  
On bullion from 750½ to 919½ parts gold, 8 cents per ounce.  
Above 950, the only charge will be for coinage. But there  
will be no charge for refining less than two dollars.

## For Coining Gold.

This charge will be the same as at the Mint—a half of one  
per cent.—and which is paid by us to that institution. But  
there will be no charge in future for making fine gold  
silver bars from bullion refined by us.

## Returns in Coin made in Forty-eight Hours.

Silver contained in deposits for coin will be accounted for  
at the same rate customary at the Mint.

Gold bars of other Assayers in good standing, will be  
cashed by us at the highest market rates.

Dust and bullion can be forwarded to us from any part of  
the country, and returns made through Wells, Fargo & Co's  
Express.

## Charges at the U. S. Branch Mint.

For the convenience of those not familiar with the terms  
of the Mint, we subjoin the tariff of charges now in force at  
that institution:

For refining bullion under 300 parts gold, 3 cents per  
ounce.

For refining bullion from 300 1-2 to 600 parts gold, 5 cents  
per ounce.

For refining bullion from 600 1-2 to 750 parts gold, 7 cents  
per ounce.

For refining bullion from 750 1-2 to 919 parts gold, 11 cents  
per ounce.

For refining bullion from 919 1-2 to 999 parts gold, 14  
cents per ounce.

The charge for coinage is a half of one per cent., and the  
charge for making the silver bars, the same.

Comparing the net value of deposits for coinage, with the  
proceeds of unparted gold bars sold in the market—assum-  
ing that the bars have cost ½ of one per cent.—they must  
be sold at the following par rates to equal the return which  
would have been made had they been deposited for  
coinage.

330 par to equal Mint return, at refining charge of 14 cents.

345 par to equal Mint return, at refining charge of 11 cents.

365 par to equal San Francisco A. & R. Works return, at  
refining charge of 5 cents. 5v14-11

HENRY WARD BEECHER ON FAST HORSES. Mr. Beecher descants thus: "If a horse has had swiftness put into him, it is fair to give him a chance to develop his gifts. Of course there is reason in all things. Even in trotting, it is easier and pleasanter for some horses to go twelve miles an hour than for others to go three. They were made so. Does it hurt a swallow to go swifter than an ox? Why not? Because he was made so. It is easy to do the thing we were made to do easily. And a good horse was made to go fast. He does it, when wild, of his own accord. He does not lose the relish of speed even when domesticated. Take a fine fed horse, which in harness looks as if he were a pattern of moderation, a very deacon of sobriety, and turn him loose in pasture. Whew, what a change! He takes one or two steps slowly, just to be sure you have let go of him, and then with a squeal he flies by his heels in the air, till the sun flashes from his polished shoes; then off he goes, faster and fiercer, clear across the lot, till the fence brings him up. And then, his eye flashing, his mane lifted and swelling, his tail up like a king's scepter, he snorts defiance to you from afar; and with a series of rearings, running sideways and plungings, whiskings and whirrs, he starts again, with immense enjoyment, into another round of running. Do you not see it is more than fun? It is ecstasy. It is horse-rapture!

Engraved to Order.—Persons who desire to illustrate their individual estate—business, should give their orders for Engraving and Printing, and we will guarantee good work and reasonable prices.

DEWEY & CO.,  
Patent Agents, Publishers and Job Printers, 505 Clay st.

## New Mining Advertisements.

**Cosima Silver Mining Company, Cosima District,**  
State of Sonora, Mexico.  
Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twelfth day of March, 1887, an assessment of one dollar (\$1) per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, to Charles Mack, Secretary, at the office of this Company, 510 Battery street, opposite the Custom House, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on the eighteenth day of April, 1887, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the seventh day of May, 1887, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

CHAS. BAUM, Secretary.  
Office, No. 510 Battery street, opposite the Custom House, San Francisco, California.

**George Washington Gold and Silver Mining Company.—Location of Works:** Silver Mountain District, Alpine County, Cal.

Notice.—There are delinquent, upon the following described stock, on account of assessment levied on the fifth day of February, 1887, the several amounts set opposite the names of the respective shareholders as follows:

Office, 440 California street, San Francisco. m9

**Mount Tenabo Silver Mining Company.—Lo-**  
cation of Works: Cortez District, Lander County, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the fifteenth day of February, 1887, an assessment of one dollar and fifty cents (\$1.50) per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary, 331 Montgomery street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the twenty-first (21st) day of March, 1887, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Thursday, the eleventh day of April, 1887, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

R. N. VAN BRUNT, Secretary.  
Office, 331 Montgomery street, San Francisco. feb 16

**San Marcial Silver Mining Company.—Loca-**  
tion of Works: San Marcial, District of Hermosillo, State of Sonora, Mexico.

Notice is hereby given, that the Annual Meeting of the shareholders of the above named Company, will be held on TUESDAY, the nineteenth day of March, 1887, at 7 1/2 o'clock P. M., of that day, at the office of the Company, No. 331 Montgomery street, San Francisco, for the election of Trustees to serve the ensuing year, and for the transaction of other business.

R. N. VAN BRUNT, Secretary.  
Office, 331 Montgomery street, San Francisco. m2

**San Marcial Silver Mining Company.—Loca-**  
tion of Works: San Marcial, District of Hermosillo, State of Sonora, Mexico.

Notice.—There are delinquent, upon the following described stock on account of assessment levied on the thirtieth day of January, 1887, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
Brancham, Isaac	15, 16, 17, 18, 19	900	\$450 00
Brancham, Isaac	21, 22, 23, 100 ea	900	25 00
Brancham, Isaac	24	25	12 50
Brancham, Isaac	25	500	250 00
Brancham, Isaac	262	400	200 00
Harris, Ben. E.	228	77	38 50
Harris, Ben. E.	229	100	50 00
Harris, Ben. E.	231	300	150 00
Harris, Ben. E.	237	10	5 00
Harris, Ben. E.	244	10	5 00
White & Co. P. J.	383	900	450 00

And in accordance with law, and an order of the Board of Trustees, made on the thirtieth day of January, 1887, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, by Maurice Dore & Co., No. 327 Montgomery street, San Francisco, California, on the thirtieth day of March, 1887, at the hour of 12 o'clock, M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

R. N. VAN BRUNT, Secretary.  
Office, 331 Montgomery street, San Francisco. m9

## Important to Secretaries.

Secretaries will please write proper names and figures distinctly, and hand in their advertisements as early in the week as possible, so that they may be published on the evening. Any information concerning the requirements of the laws regarding advertisements will be cheerfully given when solicited. Inspect all your notices carefully upon their appearance. In case of postponement give the earliest notice possible at the office. When copy is received sufficiently early, a proof-sheet will be furnished if desired. A revised copy rendered, for advertising notices, will be required. Send printed copies of advertisements, for serving individual notice to stockholders, printed at \$1 per hundred. Copies of the new advertising law, as officially published, furnished gratuitously. 227 Blank forms, for filling out Assessment Notices and Delinquent Sales, supplied free to advertisers in the Mining and Scientific Press on application at the office.

W. B. E. & CO., Publishers.  
405 Clay street, corner Sansome, San Francisco.

**Siskiyou Mining Company. Location of Works:**  
Middle Fork of Humboldt Creek, in the County of Siskiyou, State of California.

Notice.—There are delinquent upon the following described stock, on account of assessment levied on the tenth day of December, 1886, the several amounts set opposite the names of the respective shareholders, as follows:

## Machinery.

STEWART'S  
CELEBRATED HINGED  
Grinder and Amalgamator.

## Is the Cheapest and Quickest Pan

Now used. It is flat-bottomed, loses far less power in throwing the pulp, and circulates the same under the miller to better advantage than any other Pan in use, while the action owing to the thinness of the cone, has a more direct effect in beating the pulp. E is the miller plate, F the Grinding Shoe, atached by an adjustable hinge joint in the middle of the same—the bottom wearing down even with the dies.

Mr. J. H. STEWART, the inventor, has had ten years' experience in mechanical operations, and may be addressed at San Francisco, or called on at the Miners' Foundry, First street, where his Pan is manufactured, and is to be seen at any time in operation. 5v14d

HUNTER'S  
IMPROVED CONCENTRATOR.

THE INVENTOR OF THE ABOVE RECENTLY IMPROVED Machine, is now prepared to take contracts for concentrating gold or silver ores on shares, receiving a certain per cent. of the sulphurets as may be agreed upon; and will guarantee twenty per cent. more sulphurets than from any rocker or concentrator built on the Pacific coast, saving at least ninety per cent. of the sulphurets contained in the ore. The sulphurets, if desired for shipping, will contain less than one per cent. of sand.

Persons who have sulphureted ores will do well to have their sulphurets saved; as the many failures in mining can often be attributed to the waste of sulphurets. For particulars, address

One of these Machines can be seen in operation at the Union Foundry, in this city, up stairs.

ANDREW HUNTER, Inventor,  
22v13-3m San Francisco.

VARNEY'S  
PATENT AMALGAMATOR.

## These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows: The pan being filled, the motion of the miller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to this circumstance as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Sellers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the  
PACIFIC FOUNDRY,  
1v1 San Francisco.

23v12 3mBRUCKNER'S  
Mechanical Roasting Furnace

AWARDED A

## PREMIUM SILVER MEDAL

—BY THE—

## The Mechanics' Institute.

Patented December, 1865.

THESE FURNACES ARE NOW MANUFACTURED AFTER an improved mode of construction, which GREATLY SIMPLIFIES THEIR OPERATION, and afford a much larger oxidizing surface to the action of heat and atmosphere.

The weight of a Furnace nine feet long by four feet in diameter does not exceed one ton.

## THE IMPROVED FURNACE

May be seen in operation, for desulphurizing or roasting and chloridizing, at Central Mill, Virginia City, Nevada.

Parties wishing to erect such Furnaces, are requested to leave their orders with

T. KALLENBERG,  
19v12 416 Market street, San Francisco.

## Brodie's Patented Improvements

FOR THE TREATMENT OF  
Gold and Silver Ores.

BRODIE'S PATENT IMPROVED QUARTZ CRUSHER. The attention of all interested in Mining is respectfully called to this Improved Machine for Breaking or Spalling Quartz, or other Rock, possessing, as it does, simplicity of action and lightness of construction, so far as compatible with strength and durability. In consequence of these advantages, the advertisers are enabled to offer these machines to the public at the following low terms: No. 1—Or 10-inch Crusher, capable of reducing from three to four tons of quartz per hour, no piece being larger than a walnut—price.....\$600 No. 2—Or 15-inch Crusher, capable of similarly putting through five to six tons per hour.....\$850 No. 3—Or 18-inch Crusher, will in a similar manner crush from seven to eight tons per hour.....1,200

## EXPLANATION OF THE ABOVE ENGRAVING.

The frame is made of cast iron, bound with heavy wrought iron bands, making it very strong, and at the same time light and portable. The crusher is bolted to a wood frame of sufficient height to clear the fly-wheel, and allow the crushed quartz to pass off. The dotted lines show the movable and stationary jaws. Letter A represents the eccentric shaft by which the power is applied direct to the movable jaw. B represents the movable jaw, and C the fixed jaw. D represents the link or radius bar. E represents the bolts for regulating the thickness of the feed, which can be regulated at pleasure, so to graduate to the size to which it is intended the quartz shall be crushed. G represents the feed opening, by which the size of the machine is designated.

The arrow on the fly-wheel shows the direction to drive the eccentric, which, in combination with the link, G, gives the movable jaw, B, a forward and downward motion at the same time, and which makes the hardest rock yield and separate into fragments of any desired size.

The above Crushers have been recently erected and are now successfully employed at Bear Valley, Mariposa county, Rawhide Ranch, Tuolumne county, Excelsior Mine, Lake District, Nevada county, and can be seen in operation at the Fulton Foundry, First street, San Francisco.

The following testimonial respecting the effectiveness of this Crusher, has been received from the Superintendent of the "Rawhide Ranch" Mine, in Tuolumne County:

RAWHIDE RANCH, Tuolumne Co., Sept. 23, 1865.

JAMES BAUME, Esq., San Francisco—My Dear Sir: I rejoice me pleasure to inform you that I have for the past three months had one of your largest sized Rock Crushers in use, at the Rawhide Ranch Mining Company's Mill, which it is entirely met in expectations; and I have not hesitation in recommending it to all who are in need of a machine for rapidly, cheaply and properly preparing quartz for the stamps. Yours truly,

R. P. JOHNSON, Supt. Rawhide Ranch Quartz Mill.

BRODIE'S PATENT IMPROVED GERMAN AMALGAMATING BARREL.—This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, in 1864. Further particulars will be afforded on application to the subscribers.

Those infringing the patent rights to the above improved Barrel, are hereby informed that on and after the 1st November, 1865, the royalty charged for using the same will be raised to the sum of \$100 per Barrel.

A diagram, with explanations of this machine, will be found in the "Mining and Scientific Press," of September 29th, 1865.

BRODIE'S PATENT WIND-BLAST SEPARATOR FOR DRY CRUSHING.—This Dry Crusher has been found the most economical and effective mode of crushing ores in Mexico, California and Nevada. Diagrams and explanations afforded on application to the subscribers.

A drawing and full description of this machine will be found in the Mining and Scientific Press of Sept. 22d, 1865.

BRODIE & RADCLIFF, Express Building, 402 Montgomery street, San Francisco.

## Foundry for Sale.

A One-half Interest in the

## UNION IRON WORKS,

SACRAMENTO,

Owned by William B. Williams, is offered for sale on the most favorable terms.

## A Good Bargain

May be had, as the proprietor is going home to Europe. It is seldom that so good an opportunity is offered for a sure and permanent investment. The business of the establishment is exceedingly flourishing, as can be shown. The Shop is of brick, new and well built. The lot is 35 feet front by 133 feet in depth, in a good location for this business, on Front street, between N and O streets.

Inquire at the office of the Foundry, or address

CEMENT MINING IN PLACER COUNTY  
A letter to the Auburn Stars and Stripes from Bath, three miles above Forest Hill, has the following:

It was supposed at one time that the well known "Dewey claim" at this place was "played out," and the interests were sold for a mere nominal price, changing about until they fell into the present owners' hands. These are now pushing ahead with sure prospects of a rich reward, taking out and crushing about one hundred tons per twenty-four hours, with twenty stamps. They have in fair view "pay matter" sufficient to keep their mill running for the next five years; and they have every reason to expect that the entire claim (300 feet in width by one mile in length) will pay equally well. Adjoining this claim on the south—now opened, and being worked with two mills, one of ten and the other of five stamps, are two more claims. The "pay matter" is taken out and delivered at the mill at a cost of about one dollar and a half per ton. It yields from five to eight dollars per ton, each stamp crushing about five tons per twenty-four hours. Another claim adjoining has recently changed hands in part, and will have a mill. No one can form any estimate of the value and extent of this rich deposit, but the vast amount of tunneling and drifting has settled the question beyond a doubt that this whole region for many miles in extent is one vast bed of gravel—geologically speaking, recent, as parts of trees of different dimensions are found in a semi-petrified state. It is also difficult to estimate the amount and extent of the tunneling; yet I think I may safely say, that within an area of six miles the tunnels—by lineal measure—(aside from drifts) and these were mostly in bedrock, would not fall far short of thirty miles in length, mostly run by poor men. The best pay is found in most instances near to and on the bedrock, and extending down into the latter from one to two feet.

A DECAYED MINING TOWN.—A correspondent of the Stockton Independent, says of Columbia, Tuolumne county: "Eight or nine years ago this was the queen of mountain towns. To-day, instead of thousands of miners swarming over the flats and through the gulches in the vicinity, almost total desertion meets the eye. A number of water-wheels, flumes, etc., still seem to be in active operation, as though striving on their own hook to keep a 'proper show of resistance' to decay. The city—for it still boasts of an incorporation—bears numerous evidences of what it has been in years past, in the way of stores, public buildings, and private residences, many of which are now vacant and being removed in order to give elbow-room to the miner. As the diggings about the city began to run out, and the bedrock offered little inducements to the heroes of the pick and shovel to proceed further in the bowels of the earth in search of the 'filthy lucre,' their operations extended into the suburbs, and generally with the most flattering results. Lot followed lot, and disappeared rapidly down the sluices, until the town is now limited to a narrow neck of earth, bounded on all sides by an array of sharp and rugged boulders laid bare by continual washing and scraping."

REMARKABLE GROWTH OF CABBAGE.—The Canadian Farmer, in copying an article from this paper, on the remarkable growth of cabbage in this State, in which it was stated that the stalk became so firm, as to permit of its being manufactured into canes, adds the following:

The same preternatural growth of the cabbage occurs in the island of Jersey, and other islands of the British Channel. The practice of manufacturing walking sticks from the stalks is there so common, that unlike the California phenomenon exhibited in New York, it attracts no special attention, except from the visitor and stranger. The writer had lately one of these curious canes in his own possession. During a winter's residence in the island of Jersey, he has often walked through a farmer's cabbage garden, between rows of these plants towering above his head. They are grown for the use of the small breed of cattle peculiar to the island, and known as the Alderney breed. The lower leaves are plucked for this purpose from time to time, and the stem, continuing to shoot up, carries with it as a sort of crown, a tolerably compact looking cabbage. They continue green and slowly growing throughout the mild winter of that climate.

THREE THOUSAND gallons of light wines per day, on an average, were imported into San Francisco during the year 1866.

NOT THE FAULT OF THE DAVY LAMP.—In Mr. Warrington Smyth's lecture on mining, it is stated that the vast majority of the mine explosions which take place, are due to the unscrewing of the cover of the Davy lamp by careless workmen, in order to get a better light. At the Oaks' colliery, where the recent explosion with such terrible loss of life occurred, the Stephenson lamp, called by miners the "Geordie," was used. These lamps were delivered to the workmen every morning, locked and secure. But it is believed that duplicate keys were procured by the miners, and that the lamps were occasionally opened by them, in order to light their pipes. Several of these keys were found upon the persons of the workmen after the explosion. The lecturer stated, however, that if a Davy lamp was tilted to one side, and left so until the wire gauze became red hot, there was no longer any degree of security with it.

#### Perry Davis' Vegetable Pain Killer.

The Great Family Medicine of the Age! Pain Killer, taken internally, should be adulterated with milk and water, and sweetened with sugar if desired, or made into a syrup with molasses. For a Cough, a few drops on sugar will be more effective than anything else. For Sore Throat, gargle the throat with a mixture of Pain Killer and water, and relief is immediate and the cure positive. It should not be forgotten that the Pain Killer is equally good to take internally, as to use externally. Each bottle is wrapped with full directions for its use. Please read the printed directions.

#### Allen's Lung Balsam

It is warranted to break up the most troublesome Cough in an incredibly short time. There is no remedy that can show more evidence of its merits, than this Balsam, for curing Consumption, Coughs, Colds, Asthma, Croup, etc. To Physicians—Physicians having consumptive patients and having failed to cure them by their own prescriptions, if they desire to try Allen's Lung Balsam, by writing to the proprietors they will send a formula which will enable them to judge whether the ingredients are of a superior compound or not. The medical properties are extracted by a chemical process. The apparatus by which some of them are extracted cost many thousands of dollars. Dr. H. P. Newman, Dentist, Office No. 132 West Sixth Street, (Inclined, stairs as follows: Gents—About one year ago I took a cold which settled on my lungs. A violent cough was the consequence, which increased with severity. I expectorated large quantities of phlegm and matter. During the last winter I became so much reduced that I was confined to my bed. The disease was attended with cold chills and night sweats. A diarrhea set in. My friends thought I was in the last stages of consumption, and could not possibly get well. I was recommended to try ALLEN'S LUNG BALSAM. The formula was shown to me, which induced me to give it a trial, and I will only add that my cough is entirely cured, and I am now able to attend to my business as usual. P. MEREDITH.

#### Gaston's Screw Grinder and Amalgamator

The Best Yet Invented.

For rapidity and thoroughness of work, the machine above illustrated is unequalled by any. It wastes no appreciable quantity of quicksilver, and is of itself a perfect settler. Fig. 1 represents the pan with part of its side removed, and fig. 2 the screw muller, and its shoes. The letters c show the threads of the screw; H, its shoes, and D a low cylinder within which the screw rotates; E, represents open spaces through the base of the cylinder, and F, inclined partitions filling (at those points) the spaces between the cylinder and the shell of the pan. These inclined partitions are to intercept the current of pulp around the pan, as it issues from under the muller, and turn it toward the center again, over the screw. The dies are not shown in the figure—there are eight. Mercury is not ground, nor floured in this pan. The pulp is ground to a slum, with great rapidity; the muller is raised a little and the quicksilver is poured in *en masse*, forming a layer upon the bottom of the pan. The revolution of the screw then forces the pulp down into contact with the quicksilver, into which it is *effectually rubbed* by the shoes, while the screw, being constantly fed by the pulp from above it, presses all under the muller outward—still in contact with the quicksilver, through the spaces, E, and thence over toward the center of the pan, when it is again seized by the screw and forced down into the quicksilver, rubbed into and forced off in contact with it, which process is continued as long as desired. The pulp can thus be forced into contact with the mercury at the rate of 1,000 pounds in three minutes, or twenty times per hour, and none can escape contact with the mercury, that contact being under the immense pressure of the perpetual screw, in addition to that of gravity, which (gravity) is the only available force in the other pans for bringing the pulp into contact with the quicksilver. "A word to the wise is sufficient." The Screw Amalgamator is the cheapest and most efficient pan manufactured. Millmen! call and see one running at the Pacific Foundry. For particulars, address the inventor, H. A. GASTON, at Cosmopolitan Hotel, San Francisco; or R. L. THOMAS, Esq., Virginia City, Nevada. 1v14qr

#### Portable Steam Engines!

"Hoadley's" and "Hittinger's" Make,

HOADLEY'S.

FOUR SIZES,

8, 10, 12, and 15-Horse Power,

HOADLEY'S.

3 to 40-Horse Power.

HITTINGER'S.

THREE SIZES,

5, 7, and 10-Horse Power

HITTINGER'S.

TWO SIZES,

5 and 7-Horse Power,

COMBINING THE MAXIMUM OF EFFICIENCY, DURABILITY, and Economy, with the Minimum of weight and price. These Engines are favorably known, a large number being in use on this coast for hoisting, pumping, threshing, milling and mining purposes. Steam can be got up on these Engines in fifteen minutes after reaching the place of operation, and the time, expense of setting boilers, machinery, and "construction account" saved, (which is often the difference between the successful and unsuccessful prosecution of mining enterprises,) in fact, the portable principle is the pioneer's friend, and enables him to draw engines on their own wheels, to his cabin door, and plant on the outermost confines of civilization the saw and grist mill, and it has done and will do more to help subdue the continent than any other of the modern motors which are crowding society and normalizing the world. All sizes on hand from 3 to 30 horse power, with an without carriages. Also, Portable Saw and Grist Mill's. For sale by TREADWELL & CO., 9v14-6m15p

Stair Work of all Kinds,

ELECTROTYPE CUTS, ENGRAVINGS, Etc.—Our Job Printing Office is abundantly supplied with elegant engravings, ornaments, and other embellishments to suit the various branches of industry in this State.

**MECHANICS' INSTITUTE.**—The new officers of this association were duly installed on Monday evening last. The retiring President, H. J. Booth, was the subject of a complimentary resolution, thanking him for his donation of a marble mantel for the ladies' parlor, and his offer to subscribe \$100 towards paying the debt of the Institute, when any movement is made for that purpose. The committee on the Sutro Tunnel resolutions, asked for further time, which was granted. The committee whose duty it was to confer with the owners of the new market building, reported that the monthly rent at first demanded for it, in case it should be secured for fair purposes, was \$5,000, but was thought exorbitant, and the matter left undecided. A special meeting is to be held on Monday evening next, to consider the subject. It is believed that an arrangement can be made, which will be satisfactory to all parties.

**PACIFIC COAST BUSINESS DIRECTORY FOR 1867.**—We acknowledge the receipt, from the compiler, H. G. Langley, of a copy of this work. It is the first of the kind on this coast. It is exceedingly complete; giving as it does, not only the name and address of each merchant, manufacturer, and professional man in California, Oregon, Nevada, Washington, Idaho, Montana, Utah, and British Columbia,—and the names of all the counties, cities and towns therein,—but also, lists of the quartz mills,—with particulars in regard to them,—and multifarious statistics in reference to the Agricultural and mining resources of each of these States and Territories. It consists of 568 pages, besides 400 pages of advertisements; which latter portion of the book has its separate index. We shall give it a more extended notice, with extracts, in a future issue.

**MINING STATISTICS.**—The telegraph informs us that the item in the Appropriation bill which devotes \$15,000 to the collection of mining statistics, during the present year, was retained. It would appear from this, that Congress duly appreciated the preliminary report of J. Ross Browne, the Commissioner for that purpose. We have not yet received a copy of that report, but shall give it due notice when we do.

**INTERESTING TO MINERS.**—Are mining companies liable for damages caused by accident to their claims? A trial of such a case commenced on the 6th inst. at Marysville. A man was killed, some time since, in the mine of the Pennsylvania Company, at Brown's Valley, and the administrator of the deceased has commenced a suit against the company for \$10,000 damages. We have since learned that the plaintiff was non-suited.

**THE SAN FRANCISCO CORDAGE MANUFACTORY**—one of our oldest and most flourishing establishments—a full and detailed description of whose objects and workings appeared in our issue of April 8th, 1865, continues to turn out its usual amount of Manila cordage and rope. The products of this factory have been used at the Hayward and other mines, and wherever tried have given entire satisfaction.

**HUNTER'S NEW AMALGAMATOR**, which he calls the "Eureka Rubber and Amalgamator" appears to answer well the purpose for which it was designed. Mr. William Watt, of Grass Valley, writes as follows with regard to its performance:—"After a trial of two weeks of your Eureka rubber and amalgamator we have cleaned up, and found it has saved seventy-five cents per ton over and above what we got from the copper plates of the other batteries; we run through it all the pulp that passed over the blankets from five stamps; the result is from rock that pays forty dollars per ton. I am highly pleased with it, and I think it is the best machine after blankets or plates I ever saw. It reduces the coarse particles of sand and makes the pulp more uniform in size, and it requires very little power to drive it. But the best recommendation I can give it is that I want four more. Will you please to go to the Vulcan Foundry and order them."

**NEW VEGETABLE FIBER.**—It has often been remarked that the stems of the *asclapias cornuti* (common milkweed) affords a very soft silky fiber, of great beauty and fineness, which might probably be utilized. It now appears from the *Canada Farmer* that Mr. Kirkwood, of Ottawa, Canada, has been for some time engaged in investigating this matter, and has produced a quantity of the material which he will send to the Paris Exhibition. If the results of his experiments realize his present anticipations, this hitherto despised plant will form the basis of a new industry.

Mr. Kirkwood believes the fiber to be well adapted to the manufacture of those articles in which silk is now employed. The plant is easily cultivated, and grows from three to four feet high. It is estimated that an average produce of 300 pounds per acre clean fiber, could be easily obtained, which, it is believed, could be worth about twenty cents per pound, which would amount to sixty dollars an acre. This new fiber has not yet been tested by an application to manufactures, although it is Mr. Kirkwood's intention to have it done in England. Mr. Kirkwood has been placed under obligations to Professor Hincks, of University College, Toronto, who has aided him in his investigations regarding the quality of this interesting vegetable fiber. We shall be curious to hear the result of the experiment of its manufacture in England.

**NITRO-GLYCERINE.**—We call attention to the caution notice in the advertising columns of our present issue, from the President of the U. S. Blasting Co. This article is apparently gaining favor as a blasting agent. We see that the Blue Point Company, at Sucker Flat, Yuba county, are successfully using it.

#### City Amusements.

**METROPOLITAN.**—Heller, the great magician, opened this week with his second budget of wonders. The attraction increases with each performance, so that it is difficult to secure seats. Notwithstanding the explanations given by the papers, Second Sight remains as much a mystery to the public as ever. The Goblin Drum is also very puzzling, although Mr. Heller takes great pains to explain it. The musical portion of the entertainment is alone worth the price of admission.

**OPERA HOUSE.**—At this house, "Our American Cousin" was produced on Monday night, and "Harvest Home" on Tuesday. Miss Kingsbury appeared on Thursday evening in "Pauvrete". The scene in which her cabin in the mountains is buried by an avalanche, is very effectively managed, and adds much to the interest of the play.

**ACADEMY OF MUSIC.**—Professor Siegrist had a complimentary benefit at this house on Friday evening, introducing, among other features, some of the celebrated Japanese tricks.

**WOODWARD'S GARDENS.**—The fine weather affords a good opportunity to spend a few hours at this attractive place, and should not be neglected.

#### Mineral Land Law Blanks FOR SALE.

We are prepared to furnish any of the following blanks used in securing patents for lands under the National Mineral Land Act of 1866:

- I. Applicants' Declaratory Statement.
  - II. Diagram, Description of Diagram and Boundaries, and Notice.
  - III. Register's Order for Publication—with Notice.
  - IV. Deposition that Notice has been Posted.
  - V. Application for Survey Etc.
- Prices.—Single blanks, 10 cents; 75 ets per dozen; \$4 per hundred—postage paid.  
Pamphlet containing the Law and the Instructions of the General Land Commissioner, post paid, 25 cts. Address DEWEY & CO., Mining and Scientific Press, San Francisco.

#### CHICKERING & SONS' PIANO FORTES

Never fail to stand any climate.  
The only Perfect Pianos  
They lead in all valuable improvements—all others follow.

#### Pacific Business College

—AND—

#### Telegraph Institute,

(MECHANICS' INSTITUTE.)

Post street, between Montgomery and Kearny.

THIS INSTITUTION is designed to prepare Boys and Men for

Business Pursuits,

And to impart a thorough

Commercial Education.

It is conducted upon actual business principles. The student, upon entering the College is furnished with a

Capital in Cash and Merchandise,

Rents a place of business, opens an account with the bank, insures his goods with the insurance office of the College, and enters upon the arena of business. He

Commences Speculation,

Carrying out all the details of trade—buying and selling goods, depositing in and checking from the bank, making and negotiating notes, drafts, bills of exchange, etc., recording the transactions and keeping the books in a regular and scientific manner. From this he advances to other capacities, until he finally takes his position in the

Union Business College Bank,

A regularly established institution, complete in all its appointments, and having a circulation of

One Million in College Currency.

This course saves from four to six weeks' time in copying useless manuscripts.

Penmanship.

PROF. F. SERENI, our Instructor in Penmanship, is well known to be a thorough and systematic teacher. And no College at present on this coast advertising to teach Penmanship, has ever taught the same by a regular, systematic plan, and we unhesitatingly declare, that for practical and systematic instruction in this branch, we challenge competition.

Telegraphing.

The large and increasing demand for good Telegraph Operators has induced us to organize a separate department or thorough instructions in this branch, and we are now enabled to present advantages in this line equal to any that can be afforded on the continent. Several instruments are in operation, and others will be added as occasion requires. So great is the demand for operators, that no young man, well qualified, need be wanting a situation. A skilful and accomplished operator has charge of the departments, and will devote his special attention to the advancement of the students under his charge.

There is no vacation, and students can enter upon any business day during the year. The public are invited to call and examine the various departments. Sessions day and evening.

For Circulars and further information, address  
JAMES VINSONHALER, President.  
10v14 1m

#### City College Laboratory,

South-east Cor. Stockton and Geary sts.

Practical and Analytical Chemistry and Metallurgy.

THOMAS PRICE,  
Professor of Chemistry,  
(Formerly of the Normal College, Swansea.)

WILL GIVE PRACTICAL INSTRUCTIONS IN QUALITATIVE AND QUANTITATIVE ANALYSIS AND ASSAYING. The course qualifies students for the application of Chemistry to METALLURGY, MANUFACTURING ARTS, and MINING PURPOSES.

PHARMACEUTICAL and TECHNICAL CHEMISTRY, such as is required by Medical and Pharmaceutical Students, will be taught to such students as may require it. Laboratory open every day, except Sundays, from 8 A. M. to 5 P. M.

Course of General Chemistry.

Lectures, illustrated with experiments, delivered every Friday afternoon during the College sessions, without extra charge, to the students in the Institution.

For further particulars, address  
REV. P. V. VEEDER  
Principal of the City College.  
Or, PROFESSOR THOMAS PRICE,  
6v12eow1f At 415 Montgomery street, San Francisco.

#### Golden City Chemical Works.

LABORATORY,

Corner of Seventh and Townsend Streets.

OFFICE,

Corner of Montgomery and Bush Streets.

CAPITAL STOCK, - - - \$500,000

#### BRASS AND BELL FOUNDER

Cor. Mission and Fremont sts.,  
SAN FRANCISCO.

Manufacturer of Brass, Zinc, and Anti-Friction or Babbet Metal Castings:

CHURCH AND STEAMBOAT

BELLS,

TAVERN AND HAND BELLS AND GONGS,

FIRE ENGINES, FORCE AND LIFT PUMPS,

Steam, Liqueur, Soda Oil, Water and Flange Cocks, and Valves of all descriptions, made and repaired. Also and all other joints, Spelter, Solder, and Copper Rivets, &c. Gauge Cocks, Cylinder Cocks, Oil Globes, Steam Whistles, &c.

HYDRAULIC PIPES AND NOZZLES

For Mining purposes, Iron Steam Pipe furnished with Fittings, &c. Coupling Joints of all sizes. Particular attention paid to Disillery Work. Manufacturer of "Garratt's Patent Improved Journal Metal."

Highest Market price paid for OLD BELLS, COPPER AND BRASS. 5v14 3m

#### PIONEER IRON SHUTTER WORKS!

Established 1849.

C. NUTTING,

Manufacturer of

Fire-Proof Doors and Shutters,

BANK VAULTS, PRISON CELLS, BALCONIES, AWNINGS, GRATINGS, IRON FENCE, STAIRS, Etc.,

123 Bush street,  
San Francisco.

#### FOR SALE!

PATENT RIGHT OF HUNTS WINDMILL for the State of California or the whole Pacific coast.

This Mill is superior to any other, can be built cheaper, and is more durable.

Full sets of patterns for four sizes Self-Regulating Mills, and three sizes of Adjustable Mills, will be sold with the right.

This Windmill has been extensively advertised all over this coast, and is favorably known. Apply to

E. O. HUNT,

28 SECOND STREET,  
11v14 San Francisco.

#### TO VICTIMS OF RHEUMATISM IN ALL ITS FORMS.

BE IT KNOWN TO ALL WHO ARE AFFLICTED WITH this terrible and excruciating disease, that the means of a safe, speedy and permanent cure are within the reach of every sufferer, by using

#### RICHARDS' REMEDY!

For Inflammatory, Chronic, Hereditary and Mercurial Rheumatism, Rheumatic Gout, Lumbago, Sciatica, and all the modifications of the disease, whether confined to one portion of system or erratic in its character. Composed wholly of VEGETABLE EXTRACTS, it exterminates the complaint without injuring the constitution. None but the TORTURED SUFFERERS who have been relieved from their agony by the operation of this remedy, can realize the ecstasy which the mere cessation of long-continued torment imparts. Sleep returns, strength returns, health and hope return to the pain-worn and debilitated patient, and once cured, nothing but the grossest imprudence can lead to a relapse. The confidence with which these statements are made to the public, is the result of many years' observation and experience. The reputation of mere palliatives soon dies out, but that of a STEELING MEDICINE, which produces, year after year, in all cases, the same beneficial effects, NEVER DIES. This has been the history of Richards' Remedy. Try it!

For sale by H. BOWMAN, Druggist, Sacramento. And by Druggists generally. 11v15

## A New Lubricating Oil.

We have examined at the manufactory of J. H. White & Co., No. 109 Commercial street, a new article of lubricating oil, manufactured by a process entirely new, from the crude petroleum of Santa Barbara. We have been permitted to examine the process minutely; but are not allowed to communicate the *modus operandi* to the public. We can merely state that the process is a mechanical one—which deprives the crude oil of all extraneous matter prejudicial to lubrication, without the use of the destructive distillation hitherto employed, and which, to a greater or less extent, destroys the body, and consequently the durability of the oil. Another important advantage which this possesses over the lubricating oils obtained by the ordinary process of distillation, is its entire freedom from foreign acids or alkalies, which, by the usual process, is found necessary to introduce into them in the process of manufacture. The destructive action of the small residue of acid which is always left in petroleum oils, from the refining process, is well known to machinists, and has hitherto been a decided bar against their very general introduction as a lubricating agent. The process of manufacture employed by Mr. White entirely removes this difficulty, as no acids whatever are used. This lubricating material is equal or superior to anything in use, and never "gums." On the contrary, it will soon cleanse machinery from gums left by the use of other oils. It has recently been introduced by a number of machine shops in this city, by the Oakland and Alameda ferry-boats and railroads, and by the California, Oregon and Mexican steamship lines, all of whom, we understand, pronounce it equal, if not superior to anything else of the kind in use. It is nearly or quite inodorous, and is pronounced the most durable and economical of any lubricating material in use.

The same firm also manufactures a superior quality of axle-grease, from the same material which the lubricating oil is derived from. It is prepared expressly for axles, car gearing and heavy journals, and is of a cooling nature. One of the most remarkable characteristics of this lubricating agent, is the fact, as stated, that when once upon the journals, it is of such tenacity that it will remain until entirely consumed. We would call especial attention to these lubricators as an entirely new process of manufacture; which must eventually form an important item in adding to the miscellaneous products of California, and as such, in connection with their intrinsic merits, they are well worthy of encouragement.

## A California Patent Boiler Feeder.

This feeder presents some new features which seem to commend it to the attention of engineers. It is claimed to effectually prevent the collection and deposition of sediment in the boiler from impure water.

The California Steam Navigation Co. has run boats 3,000 miles with tubular boilers, using this heater, without cleaning boilers, although the water contained as much mud as that of the Missouri river. The *Scientific American* gives the following description:

The case, A, Fig. 1, is of sheet iron or other suitable material, cylindrical, or in any other convenient form, closed at the ends by the heads, B and C, and having, at a short distance from the ends, transverse

which can be readily removed by injecting the water from the boiler through the pipe, M, and the nozzles, K.

This improvement was patented October 17, 1865, by William B. Cross, of Sacramento, California, who will furnish all necessary information.

ARRIVAL OF THE COLORADO.—This fine steamer, the pioneer in the trans-Pacific steam mail line connecting this coast with China and Japan—and whose departure on New Year's day was duly noticed by us, and duly celebrated by a grand banquet at the Occidental Hotel—returned safely to her wharf on the morning of the 20th inst. Nothing untoward occurred during the voyage; the trip was in every respect success-

AGRICULTURE ON THE COLORADO.—Mr. W. W. Hardy, of Hardyville, Arizona, writes to Mr. C. A. Luke, of this city, that he has this season put in 150 acres of barley upon his ranch, which at the time of writing was looking most promisingly. Hardyville, it will be recollected, is about seven miles above Fort Mohave on the Colorado river. Other parties have put in large crops near Beaver Lake, opposite Fort Mohave, all of which also look well. The present appearance of these crops exceed all expectation. Mr. Forrest, of Hardyville, has started a large garden, in which he purposes to raise all kinds of vegetables, etc. Other parties in that place are also turning their attention to experimental agriculture, with flattering prospects of success. The reports

are particularly interesting and important from the fact that they are the first attempts of the kind which have been made in that portion of Arizona. The success of this enterprise will be a great advantage and relief to the miners on the Colorado, who have hitherto relied for their agricultural produce solely upon distant markets. We see no reason why Central Arizona, and those parts of the territory bordering upon the Colorado, should not be made as self-sustaining as almost any mining region on the Pacific coast.

THE LAKE CHAPALA STEAMERS.—The first of these steamers, now being built by Mr. Cameron, at the Neptune Iron Works of this city, has been completed, so far as the iron work is concerned, and been taken down for transportation to its place of destination. Two others are to be built. The completion of the first boat was made the occasion of quite a little gathering on Saturday last, when a large number of persons partook of a collation in the open hull of the steamer, as she lay upon the stocks. Señor Godey, Consul of the Republic of Mexico, was present, and made a short address on the prospects of the enterprise. We gave a full account of the construction of these steamers, and the enterprise connected therewith, in our issue of the 9th instant.

THE CALEDONIA MINING COMPANY filed its certificate of incorporation on the 20th of March. The object of this company is the working of the Caledonia and Union lodes, situated in Cherokee District, Plumas county, California. The capital stock is \$125,000, in five hundred shares, of \$250 each. Trustees: R. L. Ogden, H. C. Bidwell, and Frederick Ogden.

It is said that nitro-glycerine is now in continuous use on the Pacific Railroad, for blasting purposes.

CROSS'S PATENT BOILER FEEDER.

partitions, which support the ends of the tubes, D. The water to be heated enters the shell by the pipe, E, and passes through the tubes, entering the boiler by the pipe F. The exhaust steam enters at G, and leaves at H. The pipe, I, discharges the condensed steam in the form of water. The head, C, is provided with a chamber, J, from the inner plate of which small tubes or nozzles, K, project into the water tubes, D. The sediment which may gather in the water tubes is blown out and through the pipe, L, by steam admitted at will through the pipe, M, from the boiler. The water from the boiler being discharged through the nozzles, K, into the tubes, D, effectually washes them, thus preventing the collection of sediment in the boiler.

It will be seen that the exhaust steam traverses the length of the heater surrounding the water tubes, and thoroughly heats the water before its admission to the boiler. The gradual circulation of the water through the cluster of pipes favors the deposition of the sediment mechanically suspended in it,

fully accomplished, and the enterprise may now be said to be fairly inaugurated.

The outward passage to Yokohama, 5,250 miles, occupied twenty-two days. The ship ran down from that port to Hong Kong in five and a half days, making the quickest trip on record. Of the seventy-nine days consumed in the voyage, fifty-eight were spent at sea. The total distance run was about 14,000 miles. The Colorado brought 178 passengers. Among them are two commissioners from the Japanese Government, with their attendants, making in all a party of ten. They will proceed to Washington by next steamer. The vessel was, both at Yokohama and Hongkong, an object of great interest to all residents, English, American and native. Crowds visited her decks, and she was universally pronounced the finest vessel that had ever been seen in that part of the world.

RAIN-FALL.—Thirty inches of rain have fallen from the commencement of the rainy season up to the present time, one inch of which amount has fallen during the present month.

## List of Minerals and Ores Sent to the Paris Exhibition from California.

BY W. P. BLAKE, STATE COMMISSIONER.

NOTE.—The names of donors of specimens for the collection are given at the end of the paragraph. When not otherwise stated, the specimens are from the private collection of the Commissioner.

1. Bituminous Coal, Pittsburgh mine, Mt. Diablo, California.
2. Bituminous Coal, Independence and Eureka mine, (710 ft. deep) Mt. Diablo, Cal.; Greenwood & Newbauer.
3. Brown Coal, Cowlitz River, Oregon.

26. Yellow Copper Ore, Last Chance mine, near Zinc House, Cal.
27. Native Copper, Del Norte county, Cal.
28. Yellow Copper Ore in slate, Keystone mine, Copperopolis, Cal.
29. Yellow Copper Ore, concentrated, Keystone mine, Copperopolis, Cal.
30. Yellow Copper Ore, Napoleon mine, Calaveras county, Cal.
31. Yellow Copper Ore, Newton mine, Amador county, Cal.; Cabinet State Agricultural Society.
32. Yellow Copper Ore, Cosmopolitan Lode, Genesee Valley, Plumas county, Cal.; Cabinet State Agricultural Society.
33. Copper Ore, Superior Copper Lode, Lights' Cañon, Plumas county, Cal.; Cabinet State Agricultural Society.
34. Copper Ore, Peacock Lode, Fresno county, Cal.; R. H. Rogers.
35. Vitreous Copper Ore, Mineral Point, Arizona.
36. Vitreous Copper Ore, Gem Lode, Arizona.
37. Copper Ore, Newton mine, Amador county, Cal.
38. Copper Ore, Newton mine, Amador county, Cal.
39. Cinnabar, with Carbonate of Lime, Hot Springs, Colusa county, Cal.; Cabinet State Agricultural Society.
40. Cinnabar, with Carbonate of Lime, Idaho.
41. Cinnabar, with Carbonate of Lime, Idaho.
42. Cinnabar, with Carbonate of Lime, Idaho.
43. Silver Ore (rich) Great Eastern Lode, Austin, Nevada; Shoshone Co.
44. Silver Ore (rich) Great Eastern Lode, Austin, Nev.; Shoshone Co.
45. Silver Ore (croppings) Great Eastern Lode, Austin, Nev.; Shoshone Co.
46. Silver Ore, Silver Sprout mine, Kearsarge District, Cal.
47. Silver Ore, Silver Sprout mine, Kearsarge District, Cal.
48. Silver Ore, Kearsarge mine, Kearsarge District, Cal.
49. Silver Ore, Kearsarge mine, Kearsarge District, Cal.
50. Argentiferous Galena, Kearsarge mine, Kearsarge District, Cal.
51. Silver Ore, Buena Vista claim, Inyo Mountains, Inyo county, Cal.
52. Silver Ore, San Rafael mine, Inyo Mountains, Inyo county, Cal.
53. Silver Ore, Magenta Lode, Macedonian District, San Bernardino county, Cal.; R. D'Heureuse.
54. Silver Ore with Galena, Chicago mine, Shasta county, Cal.
55. Silver Ore with Galena, Chicago mine, Shasta county, Cal.
56. Silver Ore with Galena, Chicago mine, Shasta county, Cal.
57. Silver Ore with Zincblende, Chicago mine, Shasta county, Cal.
58. Silver Ore, Diana claim, Blind Springs, Mono county, Cal.
59. Silver Ore, Rockingham claim, Blind Springs, Mono county, Cal.
60. Silver Ore, Josephine claim, Blind Springs, Mono county, Cal.
61. Silver Ore, Camanche claim, Blind Springs, Mono county, Cal.
62. Silver Ore (rich large mass) Camanche claim, Blind Springs, Mono county, Cal.; Dr. Harkness and Dr. Frey, Sacramento.
63. Argentiferous and Auriferous Copper Ore, Pahpah District, Nev.
64. Silver Ore (rich) Pootillo Series, Silver Peak or Red Mt. District, Nev.
65. Silver Ore, Antelope Lode, Esmeralda District, Nev.; Cabinet State Agricultural Society.
66. Silver Ore (very rich) Mexican mine, Virginia City, Nev.
67. Silver Ore, near La Paz, Arizona.
68. Silver Ore, near La Paz, Arizona.
69. Silver, Lead and Copper Ore, Eclipse Lode, Inyo Mts., Cal.
70. Silver, Lead and Copper Ore, Eclipse Lode, Inyo Mts., Cal.
71. Silver and Copper Ore, Green Monster Lode, Inyo Mts., Cal.
72. Silver and Copper Ore, Green Monster Lode, Inyo Mts., Cal.
73. Argentiferous Lead Ore, Stevens' Lode, Cosa District, Inyo Mts., Cal.
74. Argentiferous Lead Ore, St. Helena mine, Nev.; Sherman Day.
75. Argentiferous Lead Ore, Alvarez claim, Nev.; Sherman Day.
76. Argentiferous Lead Ore, Murphy claim, Nev.; Sherman Day.
77. Sulphuret of Antimony, Christmas Gift Lode, Telescope District, Cal.
78. Sulphuret of Antimony, Sierra county, near Downieville, Cal.; Crossman & Cochrane.
79. Cobalt and Nickel Ore (Danaite) Meadow Lake, Nevada county, Cal.; R. C. Gaskill.
80. Cobalt and Nickel Ore, Meadow Lake, Nevada county, Cal.; R. C. Gaskill.
81. Cobalt and Nickel Ore (Danaite) Meadow Lake, Nevada county, Cal.; R. C. Gaskill.
82. Lead and Zinc Ore, Williams and Kilinger, Shasta county, Cal.; Cabinet State Agricultural Society.
83. Lead Ore (Galena) Castle Dome District, Arizona.
84. Argentiferous Galena, Eclipse claim, Inyo Mts., Inyo county, Cal.
85. Galena, Yellow Copper, etc., Snav Valley, Nevada county, Cal.; Cabinet State Agricultural Society.
86. Gold Ore, Long Tom mine, Kern county, Cal.
87. Auriferous Quartz, Long Tom mine, Kern county, Cal.
88. Auriferous Quartz, Long Tom mine, Kern county, Cal.
89. Auriferous Quartz, Long Tom mine, Kern county, Cal.
90. Sulphurets, Long Tom mine, Kern county, Cal.
91. Gold Ore, Joe Walker Lode, Walker Basin, Kern county, Cal.
92. Gold Ore, Joe Walker Lode, Walker Basin, Kern county, Cal.
93. Gold Ore, Rochefort claim, Havilah, Kern county, Cal.
94. Gold Ore, Rochefort claim, Havilah, Kern county, Cal.
95. Gold Ore, French Friend claim, Havilah, Kern county, Cal.
96. Gold Ore, Mammoth Lode, Kern River, Kern county, Cal.
97. Gold Ore, Mammoth Lode, Kern River, Kern county, Cal.
98. Gold Ore, Mammoth Lode, Kern River, Kern county, Cal.
99. Gold Quartz, Pine Tree Vein, Mariposa Estate, Cal.
100. Gold Quartz, Pine Tree Vein, Mariposa Estate, Cal.
101. Gold bearing Quartz, Princeton Vein, Mariposa county, Cal.
102. Gold Quartz, App's mine, Tuolumne county, Cal.
103. Gold bearing Quartz, App's mine, Tuolumne county, Cal.
104. Gold bearing Quartz, Bacon mine, Tuolumne county, Cal.
105. Gold bearing Quartz, Chapparral Hill mine, Tuolumne county, Cal.
106. Gold bearing Quartz, Raw Hide Ranch, Tuolumne county, Cal.
107. Gold bearing Quartz, Monte Christo mine, Tuolumne county, Cal.
108. Gold bearing Quartz, Buchanan mine, Tuolumne county, Cal.
109. Gold bearing Quartz, Consuelo mine, Tuolumne county, Cal.
110. Gold bearing Quartz and Galena, Soulsby mine, Tuolumne county, Cal.
111. Gold bearing Sulphurets, Soulsby mine, Tuolumne county, Cal.
112. Auriferous Sulphurets, Gilson mine, Tuolumne county, Cal.
113. Gold bearing Quartz and Sulphurets, Coney mine, Amador county, Cal.
114. Gold bearing Quartz, Keystone mine, Amador county, Cal.
115. Gold bearing Quartz, Hayward's mine, Sutter county, Cal.
116. Gold bearing Quartz and Sulphurets, Volcano, Amador county, Cal.; Cabinet State Agricultural Society.
117. Gold Ore, Yellow Copper, etc., Golden Eagle mine, Volcano, Amador county, Cal.; Cabinet State Agricultural Society.
118. Gold Ore, Yellow Copper, etc., Golden Eagle mine, Volcano, Amador county, Cal.; Cabinet State Agricultural Society.
119. Gold in Quartz, Carson claim, Calaveras county, Cal.
120. Gold in Quartz, Carson claim, Calaveras county, Cal.
121. Gold in Quartz and Magnesite, Winter's mine, Angel's Camp, Calaveras county, Cal.
122. Native Gold in Quartz and Magnesite, Winter's mine, Angel's Camp, Calaveras county, Cal.; Dr. Hill.
123. Gold bearing Magnesite, Slocum, Bell & Co's claim, Angel's Camp, Calaveras county, Cal.
124. Gold bearing Rock, Cameron Gold mine, Angel's Camp, Calaveras county, Cal.; Peter Cameron, 1861.
125. Gold bearing Sulphurets, Angel's Camp, Calaveras county, Cal.; Slocum, Bell, and others, 1861.
126. Gold bearing Slate, South Carolina claim, Calaveras county, Cal.
127. Gold bearing Quartz, Davidson mine, El Dorado county, Cal.
128. Gold bearing Quartz, Davidson mine, El Dorado county, Cal.
129. Gold bearing Sulphurets, Golden Eagle mine, Amador county, Cal.; L. W. Coe.
130. Gold bearing Quartz, Montezuma Lode, El Dorado county, Cal.; Cabinet State Agricultural Society.
131. Gold bearing Quartz and Sulphurets, Capt. Mallet's mine, Placer county, Cal.
132. Gold bearing Quartz and Sulphurets, Capt. Mallet's mine, Placer county, Cal.
133. Gold bearing Quartz and Sulphurets, Lady Lincoln mine, Placer county, Cal.
134. Gold bearing Quartz and Sulphurets, Lady Lincoln mine, Placer county, Cal.
135. Gold and Silver bearing Quartz, Boulder Lode, Placer county, Cal.
136. Gold and Silver bearing Quartz, Boulder Lode, Placer county, Cal.
137. Gold and Silver bearing Quartz, Boulder Lode, Placer county, Cal.
138. Gold bearing Quartz, Mill Lode, Placer county, Cal.
139. Gold bearing Quartz, St. Lawrence mine, Placer county, Cal.
140. Gold bearing Quartz, St. Lawrence mine, Placer county, Cal.
141. Gold bearing Quartz, St. Lawrence mine, Placer county, Cal.
142. Gold bearing Quartz and Sulphurets, North Star Lode, Placer county, Cal.
143. Gold bearing Quartz, Mexican No. 1, Forbestown, Butte county, Cal.
144. Gold bearing Quartz, Mexican No. 1, Forbestown, Butte county, Cal.
145. Gold bearing Quartz, Mexican No. 1, Forbestown, Butte county, Cal.
146. Gold bearing Sulphurets, Mexican No. 2, Forbestown, Butte county, Cal.
147. Gold bearing Sulphurets, Mexican No. 2, Forbestown, Butte county, Cal.
148. Gold bearing Sulphurets, Mexican No. 2, Forbestown, Butte county, Cal.
149. Gold bearing Quartz and Sulphurets, Mexican No. 2, Forbestown, Butte county, Cal.
150. Gold bearing Quartz and Sulphurets, Mexican No. 2, Forbestown, Butte county, Cal.
151. Gold bearing Quartz, decomposed, Mexican No. 2, Forbestown, Butte county, Cal.
152. Gold bearing Sulphurets and Quartz, Sulphuret Lode, Forbestown, Butte county, Cal.
153. Gold bearing Quartz, Shakspeare Lode, Forbestown, Butte county, Cal.
154. Gold bearing Quartz, Roberts' Lode, Forbestown, Butte county, Cal.
155. Gold bearing Sulphurets, Mexican No. 2, Forbestown, Butte county, Cal.
156. Gold bearing Sulphurets (clean) Mexican No. 1, Forbestown, Butte county, Cal.
157. Gold bearing Quartz, Jefferson mine, Brown's Valley, Yuba county, Cal.
158. Gold bearing Quartz, Jefferson mine, Brown's Valley, Yuba county, Cal.
159. Gold bearing Quartz, Jefferson mine, Brown's Valley, Yuba county, Cal.
160. Gold bearing Quartz, Jefferson mine, Brown's Valley, Yuba county, Cal.
161. Gold bearing Quartz, Jefferson mine, Brown's Valley, Yuba county, Cal.
162. Wall Rock, Jefferson mine, Brown's Valley, Yuba county, Cal.
163. Wall Rock, Jefferson mine, Brown's Valley, Yuba county, Cal.
164. Gold bearing Quartz, Pennsylvania mine, Brown's Valley, Yuba county, Cal.
165. Gold bearing Quartz, Pennsylvania mine, Brown's Valley, Yuba county, Cal.
166. Gold bearing Quartz, Pennsylvania mine, Brown's Valley, Yuba county, Cal.
167. Gold bearing Quartz, Sierra Buttes mine, Sierra county, Cal.
168. Gold bearing Quartz, Sierra Buttes mine, Sierra county, Cal.
169. Gold bearing Quartz, Sierra Buttes mine, Sierra county, (upper tunnel) Cal.
170. Gold bearing Quartz, Sierra Buttes mine, Sierra county, (upper tunnel) Cal.
171. Soft Quartz (lowest level) Sierra Buttes mine, Sierra county, Cal.
172. Gold bearing Quartz (lowest level) Sierra Buttes mine, Sierra county, Cal.
173. Gold bearing Quartz (rich) 3d level, Sierra Buttes mine, Sierra county, Cal.
174. Gold bearing Quartz, (rich) 3d level, Sierra Buttes mine, Sierra county, Cal.
175. Gold bearing Quartz, with Sulphurets, Rose Lode, Sierra Buttes mine, Sierra county, Cal.
176. Gold bearing Quartz (rich) Rose Lode, Sierra Buttes mine, Sierra county, Cal.
177. Gold bearing Quartz (rich) Rose Lode, Sierra Buttes mine, Sierra county, Cal.
178. Gold bearing Quartz (rich) Rose Lode, Sierra Buttes mine, Sierra county, Cal.
179. Gold bearing Quartz (tunnel No. 2) Rose Lode, Sierra Buttes mine, Sierra county, Cal.
180. Gold bearing Quartz, (rich) tunnel No. 2, Rose Lode, Sierra Buttes mine, Sierra county, Cal.
181. Gold bearing Quartz, Rose Lode, Sierra Buttes mine, Sierra county, Cal.
182. Gold bearing Quartz (tunnel No. 3) Ariel Lode, Sierra Buttes mine, Sierra county, Cal.
183. Gold bearing Quartz (very rich, tunnel No. 3), Ariel Lode, Sierra Buttes mine, Sierra county, Cal.
184. Soft Gold Quartz, Ariel Lode, Sierra Buttes mine, Cal.
185. Green Rock, from the vein, Sierra Buttes mine, Sierra county, Cal.
186. Clean Sulphurets, from the tailings, Sierra Buttes mine, Sierra county, Cal.
187. Gold bearing Quartz, Independence Gold mine, Sierra county, Cal.
188. Gold bearing Quartz, Independence Gold mine, Sierra county, Cal.
189. Gold bearing Quartz, Independence Gold mine, Sierra county, Cal.
190. Tailings (average) Sierra Buttes mine, Sierra county, Cal.
191. Gold Quartz (very rich) Barnhardt claim, near Sierra Buttes claim, Sierra county, Cal.
192. Auriferous Galena in Quartz, Primrose mine, Sierra county, Cal.; Crossman & Cochrane, Downieville.
193. Gold in Quartz, Primrose mine, Hog Cañon, Sierra county, Cal.; Crossman & Cochrane.
194. Gold bearing Quartz, Primrose mine, Sierra county, Cal.; Crossman & Cochrane.
195. Gold in Quartz, Primrose mine, Sierra county, Cal.; Crossman & Cochrane.
196. Gold bearing Quartz, Belzona mine, Ladies' Cañon, Sierra county, Cal.; Crossman & Cochrane.
197. Gold bearing Quartz, Four Hills, Sierra county, Cal.; Crossman & Cochrane.
198. Gold bearing Quartz, Four Hills, Sierra county, Cal.; Crossman & Cochrane.

199. Sulphuret of Molybdenum in Quartz, Sierra county, Cal.; Crossman & Cochrane.
200. Gold bearing Arsenical Pyrites, Fac Similo mine, Sierra county Cal.; Crossman & Cochrane.
201. Gold bearing Sulphurets (decomposed) near Sierra Buttes, Sierra county, Cal.; Crossman & Cochrane.
202. Sulphurets, Mexican mine, Downieville, Sierra county, Cal.; Crossman & Cochrane.
203. Yellow Copper Ore, Sierra county, Cal.; Crossman & Cochrane.
204. Sulphuret of Iron with Gold, Harpending mine, Placer county, Cal.
205. Sulphuret of Iron in Slate, Harpending mine, Placer county, Cal.
206. Soft Slate (auriferous) Harpending mine, Placer county, Cal.
207. Soft Slate (auriferous) Harpending mine, Placer county, Cal.
208. Soft Slate (auriferous) Harpending mine, Placer county, Cal.
209. Soft Slate (auriferous) Harpending mine, Placer county, Cal.
210. Soft Slate (ochery) Harpending mine, Placer county, Cal.
211. Gold bearing Sulphurets, Seaton mine, Amador county, Cal.
212. Gold bearing Quartz, Moss Lode, Arizona.
213. Gold bearing Quartz (rich) Vulture Lode, Arizona.
- 214 to 219 inclusive, Borax Crystals, from Borax Lake, Lake county, Cal.; California Borax Co.
220. Mud, containing large Crystals of Borax, Borax Lake, Lake county, Cal.; California Borax Co.
221. Mud containing small Crystals of Borax, Borax Lake, Lake county, Cal.; California Borax Co.
222. Borax, small Crystals (washed) Borax Lake, Lake county, Cal.; California Borax Co.
223. Mud of Borax Lake (dry) Borax Lake, Lake county, Cal.; California Borax Co.
224. Incrustation from Lake-bed Borax Lake, Lake county, Cal.; California Borax Company.
225. Crude Boracic Acid, Lake county, Cal.; California Borax Co.
226. Borax Refined, Borax Lake, Lake county, Cal.; California Borax Co.
227. Magnetic Iron Ore, San Saba, Sierra county, Cal.; Crossman & Cochrane, Downieville.
228. Magnetic Iron Ore, San Saba, Sierra county, Cal.; Crossman & Cochrane.
229. Magnetic Iron Ore, Sierra county, Cal.; Cabinet State Agricultural Society.
230. Iron Ore, Yankee Hill, Butte county, Cal.; Cabinet State Agricultural Society.
231. Iron Ore, Butte county, Cal.; A. James.
232. Magnetic Iron Ore, Butte county, Cal.; A. James.
233. Chromo Iron Ore, Forbestown, Butte county, Cal.
234. Oxide Manganese, Red Island, San Francisco Bay, Cal.
235. Oxide Manganese, Red Island, San Francisco Bay, Cal.
236. Oxide Manganese with Chert, Red Island, San Francisco Bay, Cal.
237. Oxide of Manganese, Red Island, San Francisco Bay, Cal.
238. Copper Ore, Planet mine, Arizona; Richard Ryland.
239. Silicate of Copper, Mineral Hill, Arizona.
240. Silver and Copper Ore, Pueblo mine, Nev.
241. Silver and Copper Ore, Pueblo mine, Nev.
242. Native Gold in Semi-Opal, King's mine, Mohawk Valley, Plumas county, Cal.; Mr. Seaman, Downieville.
243. Free Gold in Quartz, Keystone mine, Sierra county, Cal.; Mr. Seaman.
244. White Earth, Tehama county, Cal.; R. G. Sneath.
245. Selenite in Transparent Plates, Tebama county, Cal.; R. G. Sneath.
246. Gold Quartz, Middle Ledge, Silver Mountain, Cal.
247. Steatite (soft) El Dorado county, Cal.; J. Patterson.
248. Steatite (hard) El Dorado county, Cal.; J. Patterson.
249. Monterey Sand (for glass manufacture) Monterey, Monterey county, Cal.; R. T. Holmes.
250. Carbonate of Magnesia, Napa county, Cal.; R. T. Holmes.
251. Hydraulic Cement, Bonicia, Cal.; R. T. Holmes.
252. Hydraulic Cement, Benicia, Cal.
253. Auriferous Sulphurets, Soulsby mine, Tuolumne county, Cal.
254. Copper Ore, New Mine, Tucson, Arizona.
255. Auriferous Sulphurets, Barrett mine, Mariposa county, Cal.

256. White Quartz Sand, Monterey, Monterey county, Cal.; D. Jacks.
257. Cement Gravel, near Mokelumne Hill, Calaveras county, Cal.
258. Gold Quartz, Cinderella Lode, White Mountains, Cal.
259. Gold in Quartz, Eureka mine, Grass Valley, Cal.
260. Auriferous Sulphurets, Eureka mine, Grass Valley, Cal.
261. Gold bearing Quartz, Norambagua mine, Grass Valley, Cal.
262. Gold bearing Quartz, Norambagua mine, Grass Valley, Cal.
263. Auriferous Sulphurets, Norambagua mine, Grass Valley, Cal.
264. Cap Rock, Norambagua mine, Grass Valley, Cal.
265. Wall Rock, Norambagua mine, Grass Valley, Cal.
266. Gold bearing Quartz, Lone Jack mine, Grass Valley, Cal.
267. Gold bearing Quartz, Lone Jack mine, Cal.
268. Gold in Quartz, Lone Jack mine, Grass Valley, Cal.
269. Auriferous Sulphurets, Lone Jack mine, Grass Valley, Cal.
270. Gold bearing Quartz, Providence mine, Nevada county, Cal.
271. Gold bearing Quartz, Providence mine, Nevada county, Cal.
272. Gold bearing Quartz, Lone Star mine, Nevada county, Cal.
273. Petroleum, Mattole, Humboldt county, Cal.
274. Petroleum, Union Mattole Co., Humboldt county, Cal.
275. Petroleum, Joel's Flat, Noble Spring, Humboldt county, Cal.
276. Petroleum (thick) Santa Barbara, Santa Barbara county, Cal.
277. Petroleum, Wiloy Spring, San Fernando Mountains, Cal.
278. Petroleum, Hughes' Spring, San Fernando Mountains, Cal.
279. Petroleum, Pico Spring, San Fernando, Mountains, Cal.
280. Petroleum, Hayward & Coleman claim, Sulphur Mountains, Cal.
281. Petroleum, Stanford Bros. claim, Sulphur Mountains, Cal.
282. Petroleum (refined) from Oil of Stanford claim, Sulphur Mountains, Cal.
283. Petroleum (refined lubricating) from Oil of Stanford claim, Sulphur Mountains, Cal.
284. Petroleum (crude) Cañada Larga, Santa Barbara county, Cal.
285. Petroleum (crude) Santa Cruz, Santa Cruz county, Cal.
286. Petroleum (crude) Bear Creek, Colusa county, Cal.
287. Petroleum (crude) Chas. Stott claim, Santa Barbara county, Cal.
288. Petroleum (refined) Chas. Stott claim, Santa Barbara county, Cal.
289. Petroleum (refined lubricating) Chas. Stott claim, Santa Barbara county, Cal.
290. Petroleum, (refined lubricating) No. 2, Chas. Stott claim, Santa Barbara county, Cal.
291. Silicified Wood, Nevada county, Cal.
292. Silicified Wood, Nevada county, Cal.
293. Silicified Wood, Nevada county, Cal.
294. Silicified Wood, Nevada county, Cal.
295. Silicified Wood, Nevada county, Cal.
296. Silicified Wood, Nevada county, Cal.
297. Silicified Wood, Nevada county, Cal.
298. Lava overlying Auriferous Gravel, Grass Valley, Nevada county, Cal.
299. Metamorphic Rock, from gold belt, Amador county, Cal.
300. Slate, from gold belt, Amador county, Cal.
301. Wall Rock of Gold Veins, Boulder Lode, Placer county, Cal.
302. Wall Rock Soulsby Lode, Tuolumne county, Cal.

The specimens are all carefully numbered as above, and are accompanied by labels, giving the locality in full. They are all fresh and characteristic specimens, and are, generally, about four inches square. The only box of specimens sent in for the collection was from Messrs Crossman & Cochrane, of Downieville, through whom the the mines of that vicinity are well represented. The Agricultural Society at Sacramento, contributed some fine specimens from the duplicates in its cabinet. Dr. Harkness and Dr. Frey, of Sacramento, sent a large mass of silver ore, weighing over 100 pounds, from the Camanche claim, Blind Springs (No. 62). This is the largest specimen sent forward, and is separately packed. The whole collection fills eleven boxes. A fine collection of specimens from Grass Valley, has gone forward from New York, to be arranged in connection with those sent from here direct.

## Scientific Miscellany.

### Geological Changes.

Contrary to the generally received idea, the great forces of nature which have built up the earth's crust—changed it by metamorphic action, thrown up mountains here, scooped out valleys there, uplifted immense areas of stratification, and covered large tracts with molten lava—have ever been slow and uniform in their action. The geologist beholds unmistakable evidences of immense changes; he learns from the book of nature that continents have risen and sunk; that where oceans now roll, dryland once existed; while mountains bear upon their lofty slopes unmistakable evidences of having once been beneath the sea. Time was when these stupendous changes were supposed to have been confined to a few thousand years at most; and no other conclusion was left but to suppose them the result of deluges, convulsions, and cataclysms of a most extraordinary character. More mature reflection, however, and a more intimate acquaintance with the laws of the Universe, have of late years changed the current of thought among scientific minds, and Nature's economy is now regarded as slow and uniform, even in the working out of its grandest results; and that violent geological phenomena have had no existence except in local accidents of no general significance. Continued and careful observation, and the comparison of the present appearances of localities with that recorded in early historic times, taken in connection with other evidences of unmistakable significance, show us that continents even now rise and sink much as they formerly did. There is much reason to believe that the early inhabitants of Great Britain traveled dry shod back and forth from Central Europe, over what is now known as the British channel; and that the aborigines of our own continent found their way thither, without the aid of boats, across Bohring's Straits! So slowly have these great changes been wrought, that the movement which has brought them about could only be detected by the closest observations, made at long intervals of many generations between. A single life-time is much too small to even detect that nature is working at all—much less are we to infer any destruction to human life from the occurrence of such changes.

**A REMARKABLE CRYSTALLIZATION.**—The *Chemical News* says that some five tons of glycerine was recently transported from a German manufacturing house to the city of London, passing most of the distance by railroad. When it left the manufactory it presented the ordinary appearance and viscid conditions of glycerine. It was exposed, during its transit, to a very low temperature. On being examined in London, the entire lot (contained in casks of about 800 pounds each) was found to be a solidified mass of crystals, so hard that it required a hammer and chisel to break it up! The cause of the crystallization is conjectured to have been the vibration of the railway carriage, accompanied by intense cold, which enabled the particles to arrange themselves in crystalline form, analogous to the crystallization of wrought iron under the influence of vibration, or that of platinum salts when agitated by a stirring rod. The circumstance appears to have elicited much attention on the part of scientific men in the British metropolis, so much so that a series of experiments was to be tried upon glycerine, by agitation under different degrees of temperature, to determine the truth or otherwise of the theory above suggested.

The tubes of tubular bridges are generally painted white, so as to increase the radiation, and diminish the effects of expansion and contraction caused by the alternations of temperature.

The feed-water of boilers acquires a galvanic effect in passing through the copper tubes of surface condensers.

**THE CLIMATE OF THE CARBONIFEROUS ERA.**—The luxuriant vegetation of the carboniferous era was undoubtedly due, in a great measure, to the physical difference between the atmosphere of that early age and that which exists at the present time. This difference most likely arose, in the main, from a large excess of carbonic acid gas, which would form a very dense atmosphere, and act as a heavy covering for the earth; preventing, to a much greater extent than our present atmosphere can, the loss of heat by radiation, while at the same time it would offer but little if any more obstruction to the passage of the sun's rays, than now exists. Such an atmosphere would perform very much the same service which a glass covering does for a hot house; creating for the lower levels, say to within a few hundred feet of the earth, a tropical climate, which would extend even into high latitudes, and produce, even there, a luxuriant vegetation, such as is now found only in equatorial regions. There is much reason for believing that such an atmosphere might fully account for all the facts connected with the high northern distribution of fossil organic remains; the presence of which, in such localities, is often held to involve a no less important phenomena than a material change in the poles of the earth. A simple change in the constitution of the atmosphere, which might be attended with the same results, would seem to be more in unison with the harmony, uniformity and quietness of Nature's laws, than any violent disturbance in the established order and position of our planet. It may readily be conceived that any such excess of carbonic acid gas might gradually become fixed in vegetable and mineral compounds, so as to finally admit the presence of animal life, and the gradual decrease of temperature to our present status.

**NEW USE FOR PHOTOGRAPHY.**—George G. Rockwood, of New York, is said to have recently devised an apparatus for automatically registering, by photography, the state of the thermometer and barometer at various times of the day. He arranged clock work in the interior of a box containing a camera and a series of revolving sensitive plates, which at regular intervals would open a cover to the camera tube and form a photographic image of the object before it. This apparatus placed before a spirit thermometer would of course secure accurate pictures of the standing of the instrument, upon the plates successively exposed to the action of the light.

**ANOTHER.**—M. Carradi, an engineer at Marseilles, proposes to register the path of a ship, and its various tackings and evolutions, by means of photography. He calls the instrument a "lexodograph," and by it registers the various movements of the compass upon a roll of sensitive paper.

**FRICTION OF WATER.**—The friction of fifty square feet of surface on a vessel's side, which has been smoothly painted, is found to be about eight pounds at four nautical miles per hour; when the speed is increased to eight miles, the friction is increased to twenty-five pounds; at sixteen miles, the friction would be seventy-five pounds. Thus, when the speed is doubled, the friction is increased a little over three times.

"There is no inequality on the surface of the earth which does not owe its outline to the disintegration of that surface during ages, and so there is no extensive tract of land which does not owe its construction to those geological agents which have framed the globe, and in course of time made it successively what it has been at different periods."—*Agassiz*.

**LEAD AND ZINC** are greatly expanded by heat—the latter metal expands nearly two and a half times as much as wrought iron under equal temperatures.

**COMPRESSIBILITY OF GAS.**—One thousand cubic feet of ordinary illuminating gas may be readily compressed into a space of ten feet.

**THE CATACOMBS OF ROME** are to be photographed by the aid of the magnesium light. The pictures are to serve as illustrations to an elaborate work on the Catacombs.

## Weekly Stock Circular.

Of Associated Brokers of the S. F. Stock and Exchange Board  
SAN FRANCISCO, SATURDAY MORNING,  
March 23, 1887.

## MONEY MARKET.

The money market presents no material variation, and discounts are readily obtainable in bank at 1@1½ cent. per month. There is rather more confidence felt in first class mining stocks as a basis of security, and loans are now made at a rather less margin from their market value than formerly, although in some instances outside rates are paid—1½@2 cent. per month.

Transactions in bonds have been small—Government securities are not freely offered, being chiefly held for investment. June 7-30's sold at 79½@79¾, and at the close 79½ is bid and 80 asked.

Legal Tenders have been more active for the payment of freights due upon a large quantity of merchandise which has arrived recently—selling at 74¼c, and buying at 74½c.

The aggregate sales in the Stock and Exchange Board, of Stocks, Bonds and Legal Tender Notes, during the month of February, 1887, amounted to \$3,303,520.50; in February, 1886, \$3,752,292; in February, 1885, \$2,358,855; in February, 1884, \$2,726,420.50—total in four years during the month of February, \$12,191,088.

## CITY STOCKS.

The sales of city shares since our last reference have been very light, and generally speaking this class of securities are not much inquired for at present. We note sales of San Francisco Gas Company at \$69.50, buyer 15. California Steam Navigation Company sold at 66½ cent. A few shares of Oakland Railroad stock were disposed of at \$50 per share, and National Insurance Company at \$72.50.

At the annual meeting of the stockholders of the San Francisco Insurance Company, held on Tuesday, the 19th instant, the following persons were elected directors for the ensuing year: E. W. Burr, L. A. Booth, C. D. O'Sullivan, Henry H. Haight, Wm. Bosworth, J. De la Montanya, Jos. G. Eastland, O. L. Shafter, John Archibald, R. B. Woodward, B. F. Northam, Geo. J. Brooks, John Van Bergen, Benj. D. Dean, Geo. C. Boardman, C. Mayne, G. H. Gray, E. Hull, C. W. Carmany, J. H. Rutenberg, and Benj. Brewster. Subsequently the Board re-elected the following officers: Geo. C. Boardman, President; C. D. O'Sullivan, Vice President; P. McShane, Secretary.

## MINING SHARE MARKET.

The mining share market has been buoyant this week, and with scarce an exception all stocks were sought for at higher figures. The "bear" influence seems to have spent its force, without being able to resist the upward tendency of prices. The developments made within the past few months in different mines have given a new lease of life to nearly every portion of the Comstock lode, and if at still greater depths large bodies of ore continue to be found, an active speculation is likely to take place the ensuing spring. Many well-informed persons are of the opinion that the future prospects of several claims were never as flattering as at present, and that during the summer months larger dividends may be confidently anticipated.

HALE & NORCROSS—continues to be firmly held, and there is some inquiry for it at a considerable advance from our last quotations. We learn that five shares were sold privately early in the week at \$3,650 per foot. This company is in a very prosperous condition, and its future is thought to be no less flattering. One year ago last December this stock was sold as low as \$95 per foot.

SAVAGE—Savage has been in better favor since our last reference, opening at \$1,825 @ \$1,830, advancing to \$1,945@1,975, then selling at \$1,960, seller 30, and at the close \$1,950 is bid. The ore extracted from the mine during the week ending March 16th amounted to 902 tons, showing an assay value of \$29,816—equal to \$33.05 per ton. Of this amount, 554 tons came from the sixth and seventh stations, and 327 tons from the Curtis shaft, from points which it is thought might become inaccessible in a very short time. We are informed that the south winze, Curtis shaft, is still in good ore, and has now acquired sufficient depth to connect with the 780-foot level of the Hale & Norcross Company. It is thought that the

development of the last fifty feet of this winze will add very materially to the value of the mine. The required 100 feet, from the seventh to the eighth station in the Curtis shaft, have been sunk, and the new station will soon be opened. The other portions of the mine are in the same good condition as reported some time ago.

CROWN POINT—has also advanced during the period under review, rising from \$825 to \$900 and \$925, and at the close selling at \$905. Mail dates to the 17th instant say that the east drift from the 500-foot station is in 54 feet, and the west drift 20 feet. Sinking toward the sixth station will be commenced about the first of next month. During the week ending March 17th, 496 tons of ore were raised from the mine. Nothing of any special importance, it is said, has been developed recently, notwithstanding a considerable force has been employed in prospecting.

YELLOW JACKET—sold at irregular prices, jumping from \$810 to \$845 and \$880, dropping to \$825@810, rallying to \$840, and closing at \$828. We have been unable to obtain any information in regard to the condition of this mine since our last issue.

GOULD & CURRY—advanced from \$465 to \$490@495, then sold at \$507.50, and closed yesterday at \$510. This company is still drifting south on the fifth station, apparently meeting with no success in finding ore. The mill has been idle for some time on account of the bad condition of the roads, which have prevented a supply being brought to hand. This mine, it is thought, will fully produce the amount of ore estimated to be in reserve by the Superintendent in his annual report last December. From December 1, to November 30, 1886, 60,417 tons of ore were reduced—an average of 5,300 tons per month.

CHOLLAR-POTOSI—continues active at enhanced rates from closing sales of last week, improving from \$248 to \$259, and closing yesterday at \$249. The winze in the north drift from the first station, new shaft, is down to the Hale & Norcross company's drift. Water interfered with further work at that point, and those engaged in sinking were employed in taking out the ore standing above the first station over the winze. The south drift from the same station is in 102 feet, running in clay and porphyry; second station, north drift, is in 360 feet—good drifting; the north drift from the third station, has been carried 252 feet from the shaft, and is now in hard blasting rock, said to be the same as encountered before gaining the ledge in the first station.

IMPERIAL—sold to a considerable extent during the past week, rapidly advancing from \$220 to \$247.50, receding to \$225, and closing at \$233. The first clean up of this month shows a bullion yield of nearly \$18,000.

OPHIR—improved from \$230, buyer 30, to \$245, buyer 30, and closed at \$238. We have nothing special to mention in regard to this mine since our last report.

EMPIRE—has been quite actively dealt in at an advance, improving from \$170, seller 30, to \$193, then realizing \$187.50, closing yesterday at \$186. Late information from this company's mine is of a very satisfactory nature, and a more than ordinary yield of bullion during the month of March may be safely predicted.

BELCHER—improved from 107, seller 30, to \$120, and closed yesterday at \$122.50.... CONFIDENCE advanced from \$33 to \$36, (assessment delinquent), and at the close sold at \$37.... BULLION declined from \$28.50 to \$25.25, and closed at \$25.... DANEX sold at \$19@15.50.... GOLDEN RULE (Cal.) sold at \$14, seller 10. This company disbursed on the 9th inst. \$1,500, or fifty cents per share, in the shape of dividends.... OVERMAN sold at \$17.50, and at the close \$18 is bid. An assessment of \$10 per share was levied on this stock on the 12th inst.

The aggregate sales of stocks, Legal Tender Notes, etc., since Saturday last, amounted to \$693,106.75.

## National Mineral Land Law, Instructions. Blanks, Etc.

Copies of the Act of Congress, approved July 26th, 1866, relating to the Location of Mineral Lands, together with the instructions to the "United States Registers and Receivers and Surveyors General," from the Commissioner of the General Land Office Department of the Interior, dated at Washington, Jan. 14th, 1867, can be had at this office. Also a full set of blanks for making applications, advertising, etc. Address Dewey & Co., office Mining and Scientific Press, San Francisco.

## Mechanical Drawings.

Persons wishing Mechanical Drawings can obtain the services of competent draughtsmen, by applying to this office.

THE CLAUSTHAL SCHOOL OF MINES is one of the most celebrated institutions of its class in Europe. This school is conducted under the special patronage of the Prussian Government; but by a wise and liberal policy its benefits are open to all nations. It is situated in the midst of one of the most extensive and best managed mining districts in the world, and all the pupils attending instruction there have the privilege (also by royal favor and requirement) of entering any of the large smelting or other metallurgical works and mines, and there receiving practical instruction in all or any of the various branches with which they desire to become familiar. The practical course in each department is placed under the supervision of a mining official of high degree, as teachers, who assigns his pupils in squads of two or three to subordinate officials connected with the immediate administration of mines, furnaces, reducing and amalgamating operations, etc. Under his guidance the student enters the mines daily, taking note of everything, and becoming practically familiar with every department. One day in each week is devoted to sketching machinery, and to such general information as cannot be made clear during the active practical manipulations of the week. It is only by such a thorough and practical course of study that a person can arrive at such a thorough knowledge of mining and metallurgical operations as will render him competent to carry on and superintend works for himself or others. The fact that in so many cases so-called men of science have attempted to conduct such operations on this coast, and met with nothing but disaster, is sufficient evidence of the need of men educated to the business. There never need and never should be any failure in metallurgical operations, so far as obtaining the metal from the mineral is concerned; for the assay office should and always can tell what you have got, and by what process you can obtain it. No man is excusable for a failure, after he leaves the assay office and enters upon his regular working operations. The losses which have already occurred on this coast are more than ten times the necessary cost of putting in operation as good a mining school as can be found in the world. How much more will the people of California pay for their indifference to the science of mining?

### What Others Say of Our Paper.

The Mining and Scientific Press comes to us, No. 1 Vol. XIV, in a new dress of clear, open type, manufactured by Faulkner & Son, San Francisco, the first font of type ever cast on this coast. No miner in California or Nevada should be without the Press, and we venture the statement, no one interested can invest \$3 more profitably than in subscribing for it.—*Alpine Miner*.

The Mining and Scientific Press is all that its publishers claim for it, being a compendium of mining news on the Pacific Coast, and a general disseminator of all matters of interest to the mechanical and agricultural portions of the State.—*Dutch Flat Enquirer*.

It enters the new year in "homespun." To the miners, and all interested in the mines of the Pacific Coast, the Press is the most valuable paper published.—*Amador Ledger*.

The Mining and Scientific Press presents an appearance that should recommend it to every thinking and reading miner. Its new dress sets handsomely, the print is clear, and its general appearance betokens thrift.—*Esmeralda Union*.

The Mining and Scientific Press commenced a new volume January 5, on new type of California make—the first of the style, the editors say, which has yet appeared in print on this coast. It looks well.—*Humboldt Register*.

The Mining and Scientific Press—a most useful exchange.—*Oneyhee Avalanche*.

It was very appropriate that the only specially mining and mechanical paper of the coast should have the first of type from the home foundry.—*Reese River Recite*.

We rejoice to see our neighbor of the Mining and Scientific Press coming out in a new dress—as bright as new type can make it.—*S. F. Evangel*.

It deserves a hearty support from the mining and selenite public, and we are glad to see tokens that it is more and more appreciated.—*The Evangel*.

"The appearance of the paper is first rate."—*North Californian*.

### RUGGLES' PRINTING PRESS.

#### For Sale or Exchange.

The Proprietors of the Mining and Scientific Press have on hand a Half Medium Ruggles' Engine Job Press, in condition good as new, which will be sold cheap, or exchanged for a good Hand-Press of medium or large size.

DEWEY & CO., Job Printers,  
Office, 505 Clay street.

## Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

## CALIFORNIA.

## Alpine County.

The *Miner* of March 2d, says that the people of Alpine are waking up to the fact that their ores must be smelted; that after all, the combination which has been deplored as the cause of their refractory character, is a most fortunate one, and adds: The time will soon come when, instead of being a cause of discouragement, these "refractory" ores will be sought after in preference to others equally rich in gold and silver; when a lode containing this class of ore will be preferred to one wanting in sulphurets, both because of the greater persistency in depth, the stability of the sulphuret lode, and because the copper contained in such lodes can be made to pay all expenses, leaving the precious metals as nett profit.

The Secretary of the George Washington company learns by telegram that the company had a house swept away by a snow slide, and work had been suspended on their mine two weeks.

## Amador County.

*Times'* correspondent at Volcano, March 12th, says: Since the winter seems to be broken our millmen have gone to work again, and apparently with a prospect of success. Our quartz mines, in particular, seem the most flattering. Fogus & Co. have started a shaft since they bought the Golden Eagle or Vaughn mine, and got down about 15 ft., and are getting out some very rich rock, said to look as though it would pay \$500 to the ton. The Golden Gate company are also said to be getting out rich rock; they are working 240 ft. below the surface. J. M. Hanford has gone to work again on the old Romer mine.

## Butte County.

The *Chico Courier* of March 1st is informed by Mr. Shellhous that the mines about Cherokee are paying the best they have for several years, owing to the unusual quantity of water. One claim alone has taken out over \$20,000 since the first rains. The mines appear to be inexhaustible, claims having been worked for over ten years, and found each year richer and richer. Claims have been worked 70 and 80 ft. deep, without striking bedrock. Preparations are now being made to tunnel the mountain, the base of which has been discovered to be quartz gravel, and appears to be an ancient river bed.

## Calaveras County.

The *San Andreas Register*, of March 16th, has a letter from Chee Chee, which gives these items: New placer mines are being discovered, and many of them prospect well. Among the best is that owned by Judge Collins & Co., in Burke's Gulch. They have struck the old channel. It prospects entirely beyond all expectations. They have taken out some very large nuggets.... R. B. Warner's claim is paying exceedingly well.... H. Butterfield has opened a new claim on the Dead Man's Hill, which prospects well.... Hatch's claim still continues to pay well.... The claims on Warren's Ranch are turning out better than was anticipated.

West Point correspondent of the *Chronicle* says, March 14th: Henry & Lasecy's mill is now in constant operation, crushing custom rock.... Some rich quartz leads have been recently discovered in the vicinity of Sandy Gulch.... Mr. Holmes new mill on the South Fork of the Mokelumne river, is a splendid and substantial piece of work. It has at present 10 stamps, with provision for 10 more. The motor is a Tyler wheel.

Letter to the *Times* from Copperopolis, March 8th, says: The famous Union mine is now worked at a depth of from 500 to 600 feet. Night and day the work goes on, fresh hands relieving one another at intervals. Thousands of tons of rich ore are already out, more than can be transported to Stockton for many months to come.

## El Dorado County.

From the *Placerville Courier* of March 16th: Williamson, Click & Co., who have been prospecting for a quartz ledge on the south side of Clay Hill for the past month or two, have struck a well-defined ledge at a depth of 30 ft., which pays \$60 to the ton.

On Saturday last Mr. Shepherd showed us 14 lbs of rock from his claim. It appeared to be half gold, and was but a fair sample of about \$1,000 worth which he took out in 15 minutes that afternoon.

A test of some rock from the Arvidson lead shows \$60 to the ton.

Letter to same from Mud Springs: The Pochontas has an incline of 108 ft., with a 3½-ft. ledge. The 10-stamp mill resumed work on Monday last. The rock pays \$10

per ton on the average. The company are working 14 hands. Mr. Kelsea, employing six or seven hands, is working a surface claim close by the mill, and is doing well. The miners, owing to a scarcity of water during the dry season, employ their time in crushing surface quartz, which is found in abundance, and pays well.

From the *Democrat* of March 16th: On Saturday last, Mr. James Tullock sold his claim at Brownville, in this county, to Mr. G. W. Swan of this city, and parties in San Francisco, for \$18,000 in gold coin. Mr. Tullock commenced work on this claim in July last. After testing it, he erected a small mill. Four hundred tons of rock crushed in this mill averaged \$38. The ledge is 3 ft. wide, and well defined.

## Humboldt County.

From the *Humboldt Bay Journal* of Feb. 21st: Operations on the Irwin Davis well, Bear River, under the superintendency of Mr. Jno. V. Hunter, were resumed last week. The work on the Irwin Davis well, Mattole, has been suspended, and the machinery taken to Bear River. From the Union well, Mattole, we hear of good indications. At a depth of about 200 ft. a vein of oil has been struck.

A Klamath letter to same says: Mr. Hopkins, of Orleans, has sold his mining claim to Mr. Wm. Lord for the sum of \$4,500.

## Los Angeles County.

A letter to the *Alta* of March 18th, from Los Angeles, has the following: There is quite an excitement existing here concerning the new and extensive gold bearing quartz leads recently discovered in the Sierra Nevada Mountains (a continuation of the Sierra Nevada) 32 miles from this city, in a northerly direction. They are in a new district, known as the Gleason, adjoining the Soledad on the south. The Gleason ledge is immensely rich in free gold, and also abounds in sulphurets. The Hughes has just commenced sinking on the ledge. The claim is situated on both sides of the water-course, which has cut down the face of the steep mountain and exposed the ledge to a depth of 350 ft. giving a splendid opportunity for working to a great depth on the vein. The ledge thus exposed is full of gold in every part. Two tons of rock, claimed to be a fair average, yielded \$40 per ton.

## Nevada County.

From the *Transcript* of March 14th: The quartz in the mine of the Nevada company is now paying better than it has for several years, and after the last run of nine days the clean-up amounted to \$3,300. The rock which is now being worked is obtained from the upper tunnel.

The Star Spangled Banner mine, at the depth of 240 ft., is rich in sulphurets. We saw a mass of the rock yesterday, weighing 700 pounds.

Same of 15th: About three weeks since, three men commenced mining on a ravine below Newtown. Funds to pay the water bill were furnished by a friend. They soon struck a rich pay streak, and have already taken out over \$300. On Tuesday last they found a nugget worth \$32.50. The gold is all coarse, and the company own sufficient ground to last for three or four years.

Same of 19th: Palmer's mill is to be closed for thorough repairs. The Middle Yuba Canal and Water company sold a one-fourth interest in the American company's claims, situated on Manzanita Hill, on the 15th inst., to the other members of the company for the sum of \$20,000.

The Constitution and Osceola ledges, near Rough and Ready, will be immediately opened.

Work was to have been resumed upon the Last Chance copper mine yesterday. The owners have abundance of capital. A large lot of ore from the Western Star claim is to be shipped for reduction.

Same of 20th: At Little York, Curran & Buckman, in their old cement claims, are working about 35 men. They are taking out, above expenses, from \$200 to \$300 per day. Their tunnel is in 1,500 ft. from the surface, and they have a channel of cement from 16 to 18 ft. in depth. The same parties are always at work in their hydraulic claim. They have a 90-ft. bank. Joseph Gardner is running three sets of claims. He has made no thorough clean-up yet, but from partial returns it is safe to predict an excellent yield. At Liberty Hill, Gardiner is opening five new hydraulic claims. At Lowell Hill, eight miles above Little York, two sets of hydraulic claims, owned by Skein & Co. and Frick Bros., are doing well.

From the *Gazette* of March 14th: Prospects are flattering for a successful mining season in You Bet. The hydraulic miners, who were interrupted by the storm, are all at work now. Several cement mills are doing well.

At San Juan North, the famous Enurka claim, that in other days paid so enormously,

is hardly paying expenses. The Golden Gate has not equaled expectations, although it is paying its stockholders a handsome dividend. The American claim, at Manzanita Hill, yields at each clean-up of from two to four weeks' run, from \$10,000 to \$17,000.

The Grass Valley *National* of 15th says: The owners of the Bowen and Morgan claims, on San Juan Hill, have commenced operations on a large scale. The prospects are flattering.

The Ophir and Allison Ranch claims have been stopped from work for several weeks, by the great quantity of water.

EXCELSIOR.—Meadow Lake correspondence of the *Transcript*, March 15th, gives these items: The California company have struck the Knickerhocker ledge at eighty feet. The lode is fifty five feet in width.

The Winton mill is now on rock from the Lightfoot claim—an extension of the "Golden Eagle." I am confident that the issue will not be a success. The process used, in my judgment, wholly inadequate.

The milling works of the Mohawk and Montreal company will be in operation on the first of April. The ledge has been developed to the depth of 250 feet and shows excellent ore. The Gold Run Phoenix company, in the vicinity of the Mohawk, are working with energy in their tunnel. The ore is reported to be improving. The Golden Eagle company will start up again on Saturday. The Grant Mill has resumed operations.

## Placer County.

From the *Herald* of March 16th: On Tuesday last McBride, McCarty & Co., struck a rich quartz specimen in the old Buckeye claim at Bird's Valley near Michigan Bluff. It weighed 16 lbs. and when pounded up yielded eight pounds of gold. On the Saturday previous, this claim had been abandoned in disgust, by two men who had worked in it all winter.

The owners of the Harpending mine are now repairing their mill, and "getting things in trim" for an early prosecution of work on the mine this Spring. Crosby and Heck have recently completed several arrastras for their mine. A flourishing town called "Valley View," has sprung up at this point.

Wm. Weisler, of Iowa Hill, recently sold his interest in the old Jamison claim for \$8,000.

From the *Dutch Flat Enquirer* of March 6th: Mining operations are everywhere in full blast. From Hawkins and Huyck & Co., whose claims are situated at the extreme southern point of the Gold Run District, all the way for three miles or more northward to Bear river, the pipes are playing.

Letter to same from Colfax: The claim of Dillon & Co. to the west of Colfax, is still paying steadily \$8 and \$10 to the man, and Walker and Co., just above, are doing as well. They have promise of water for some time yet. The quartz fever is yet unabated. Mike Curley has just succeeded in discovering a new lode, and is at present running a tunnel to tap the vein at a respectable depth.

## Plumas County.

*Times* letter from Nelson point, February 22d: The miners at Sawpit Flat, Richmond Hill and Washing Hill, are delving away. They can get water to wash up with but once a year; that is when the snow melts in the spring. The gold is generally smooth and coarse. There is a company that purpose putting a bed rock flume in Nelson Creek. During the last month, the claim at the Willow Ranch, has had a three week's run. Dik's, Reed's and Kane's claims, on Willow creek, are paying wages; and Emmon's, on the same, but a bank claim is suspended for want of water. Richards' and White's, on Sawmill Point, have encouraging prospects.

## Shasta County.

From the *Courier* of March 16th: This week L. A. Kelley made a careful assay of a piece of Pacific rock, taken from the tunnel at a depth of 90 ft. below the surface, and the result was \$497.53 in silver, and \$102.77 in gold, per ton. A bar weighing \$65, at \$14.50 to the ounce, was the yield of one ton of Pacific rock, the first crushed in South Fork District.

## Siskiyou County.

From the *Yreka Union* of March 9th: The proprietors of the Mexican Quartz lead, on the South Fork of Humboldt, have just completed the crushing of 21 tons of their rock, and have come to the conclusion that the pay is insufficient to warrant them in any further exertion on the lead.

## Trinity County.

From the *Journal* of March 2d: Chris. Meckel and Harry Engle have discovered a rich gold quartz ledge near the head of Rich Gulch, a tributary of the East Fork of North Fork. A short distance below the surface the vein is two feet wide, and prospects well. Work is being pushed as rapidly as possible on the ledge discovered near the

mouth of Rich Gulch last fall, by Mr. Greenleaf and Kelton & Kellogg.

## Yuba County.

A correspondent of the *Marysville Appeal*, writing from Paulinville, New York township, March 13th, says: "Yesterday Mr. R. Johnson struck a decomposed quartz ledge about 300 yards from this place, from which he took, with a rocker, and picked up upwards of ten thousand dollars! There are immense quantities of gold still in sight, probably thousands more will be taken out to-day."

The *Appeal* of a later date says: Mr. Johnson came down to the city yesterday, bringing some 200 lbs. of quartz from his new ledge. Some of this is more gold than quartz. It is estimated that the lot will yield some \$10,000. Mr. Johnson was some years since a merchant at St. Louis, Sierra county. He will proceed at once to develop his claim.

At Hachetville, Brown's Ranch, the Independent Company has a ledge between three and four feet thick at the depth of 48 feet on the incline. The Big Chief company is down 20 feet. Some new surface diggings on Little Dry Creek are paying \$4 per day to the hand.

At Dobbin's Ranch, the tunnel in the Bateman Ledge is in 80 feet with good rock. The Wing ledge prospects rich on the top. So also the Gardner, and the Laborde.

Messrs. Hugg and Variel have purchased nearly all the mining ground at Camptonville, and in a few days will be running their sluices.

## ARIZONA.

A Fort Yuma letter, Feb. 23d, has these items: At Prescott there is much excitement over the discovery of new and rich placers on a tributary of the Agua Frio, near the Black Cañon, some sixty miles from Prescott. Many parties had already started for the diggings.

The quartz mills around Prescott have varied fortune. The Borger mill is said to be idle. The Woolsey mill, upon the Ticonderoga, reports excellent returns. The Noyes mill, not yet completed. The Vulture mill, successful.

From the *San Bernardino Guardian* of March 2d: On the Rothschild Copper vein, near the La Paz and Prescott road, five or six men are now at work.... New smelting furnaces for the Great Central Co. are now on the way to Williams' Fork. In the Planet mine, Williams' Fork, very rich copper ore is abundantly found. Knowles & Coffin are perfecting their smelting furnaces.... In the Weaver diggings, parties have dug a ditch on Antelope Gulch, half way between Prescott and Wickenburg, seven or eight miles long, and are only waiting for the annual rains to furnish water to those miners who threw up dirt in that gulch. Many of them think they have dirt thrown up that in one week's work will make their fortunes. These parties had to pack upon mules their lumber over one hundred miles, through a country infested by Indians; and in digging their ditch, they had to go armed, not daring to leave their guns for a moment.

A letter from Prescott to the *Times* of March 19th, says: Mining prospects continue good. The new placers, near Black Cañon, pay half an ounce per day, it is said, and crowds have left \$4 per day to get double farther off. The past two weeks quartz have also been discovered there.

Umqua quartz lode, eight miles southeast from here, at 80 ft. in depth, prospects better continually. Messrs. Noyes & Curtis own the mill there, now nearly done, and ready to run, Ticonderoga, at 90 ft., prospects richer than ever. But placer mining is all that have been talked of for the past two weeks.

## COLORADO.

Warren & Davis, who are in charge of the works of the Smelting company, at Rush Valley, after actual experience in the working of the Silver King ledge, write us as follows in reference to the mines of that region: The mines of Rush Valley can be made, under skillful and intelligent management, to yield vast quantities of precious metal, and afford profitable employment to a large mining population. This requires, moreover, but a small capital. The total cost of erecting furnaces for the reduction of 48 tons daily will be \$12,000. The daily expenses about \$1,600. The daily product will be; silver \$2,000; lead \$1,600—leaving about \$2,000 daily net profit.

From the *Times*, Feb. 12th: The Gunnell company retorted 234 ozs. for six days run.

We saw to-day a silver brick weighing 29 lbs., worth in coin, \$450; which was from average ore, at a depth of 40 ft., out of the Brown lode, Georgetown, by the Baker Mining company. This brick was the yield from 12,000 lbs. of ore.

About 300 persons are now wintering on James Creek. Cobb & Clough, Showard

and others intend erecting mills there in the spring. There is some work being done on lodes, the deepest shaft being 30 ft. Gulch mining prospects well on James creek proper, averaging 22 cents to the pan, at a depth of 14 ft.

Same of 26th: Fifty-seven ozs., worth \$1,100, was the result of four days run, with 12 stamps, of the Alps and Grenada G. M. companies. The Nash mill, of Russell Dist., has started up again, and is working on Gunnell ore. Black Hawk company's yield was 131 ozs. the last week, that of the Sterling company, 92 ozs.

John Kendall has retorted \$65 gold from half a cord of quartz, taken from a depth of 12 ft. in the National Bank lode on Casto Hill.

From the Denver News of Feb. 13th: The Pine claims were sold to a Cincinnati company, who will commence work early in the season. The Ophir company continues steadily at work.

Same of 27th: We have been shown a letter from Philadelphia stating that ore from the Esmeralda lode, in Snake River Dist., assayed at the United States Mint in that city gave, in silver and gold, at the rate of \$7,500 to the ton. There is some excitement in town about new discoveries at the old Spanish diggings, three miles up the Platte. It is reported that one man washed out \$14 in one day's work, up there recently.

#### IDAHO.

From the Owyhee *Avalanche* of March 9th: Reports from the Dashaway continue to be encouraging, both as regards size of the ledge and quality of the ore. A friend has brought in some exceedingly rich specimens of gold and silver ore from the Rising Star mine. The Oro Fino & Morning Star Mining Co., say they expect to commence work about April 1st. One hundred and thirty-three and one-third feet in the Discovery claims of the Empire quartz lode, on War Eagle, have been sold recently for \$15 per foot, and the money paid. Warnke & Swart, of Flint, have struck a vein of superior ore in the Leviathan. It is reported that the Sherman ledge in Flint district has been sold to Chicago parties. Lewis' process was tried the other day at the Cosmos company's mill. The result was a yield of \$30 per ton more than by the old process.

Letter from Flint district: Greenwell & Carter's mill has been in operation for a few days, and is making a splendid showing. The machinery at present in use is made up of two old mills; but will be replaced by new. The building is a splendid piece of work. They are crushing Rising Star ore. Four tons of 2d-class and 3½ of 1st-class ore, yielded about 150 pounds amalgam at their first clean-up.

At the Silver Cord mine, War Eagle Mountain, a shaft is being sunk from the main tunnel near the south line of the claim, where it is expected to place hoisting works. At this point in the ledge it is very rich, and a few wheelbarrow loads contain a poor man's fortune. The Woodstock proprietors are at work on their ledge and the developments are favorable. They have a shaft down forty feet, partly timbered. The improvement has been gradual from the top. They have some tons of rich ore out, which shows free gold. The Hays & Ray tunnel is being shoved into the mountain as rapidly as three shifts of men per day can do it. They have driven it about 30 ft. in a little over three weeks. Considerable blasting is required. Some good ore is being taken out. The Vulean ledge is a north extension of the Silver Cord—its dip, course and general features prove this beyond a doubt. The tunnel is now in 60 ft., and shows fully two ft. of quartz.

From the Boise City *Statesmen* of March 5th: "It now seems pretty certain that the Lemhi mines are going to be the principal attraction for the migratory miners this season. Our exchanges from different parts of the country begin to notice the departure of parties for the new mines on Salmon. The Salt Lake *Vedette* says that many parties are going from there."

Letter from Bannack to Montana *Post* of Feb. 23d: Several parties that came in from Helena, Virginia and other camps, a few days ago, made their exodus for Salmon river with hand sleds. Daily, new parties are arriving, while others are leaving for the new mines. The news from the El Dorado of the Rocky Mountains, is very satisfactory, and we predict that Salmon river will be the largest mining camp in these mountains the present season.

#### MONTANA.

From the *Post* of Feb. 16th: Cope's mill, Hot Springs District, cleared up 82½ ozs. for a run of 4½ days.

At El Dorado Hill, Calkin's Dist., a new discovery, the dirt is 5 to 12 ft. deep, and prospects from 5 to 12 cents to the pan.

A letter to same from Lost Horse Gulch, Feb. 7th, has the following: The miners are busy preparing for the coming spring. I have seen \$15 and \$20 washed from a single pan of dirt, and never less than 50 cents. Water is abundant.

Same of 23d: In Rochester Gulch, Rabbit Dist., the richest lode discovered is the Watseka. At a depth of 20 ft. the crevice-dirt yields \$1.25 to the pan.

In a new discovery between St. Louis and Skelley gulches, it is about 8 ft. to the bed-rock, and the pay dirt is some 18 inches in depth. A small handful of dirt will pan out \$1, and as high as \$50 has been taken out to the pan.

The Christnought mill will be in running order next week. The machinery used will be Chilean crushers and barrels. The shaft on the Oro Cache, from which they are taking rock, is 75 or 80 ft. in depth, and they will have some 200 tons out to start on.

The Postlewait mill made another clean up on Sunday morning. The run was 7½ days; rock crushed, Kearsarge; amount, about 100 tons; yield, \$3,996. The blanket tailings, which will average \$8 per ton, are not included in this yield. The weekly expenses of mill and mine are about \$650.

On the Lucas lode, the vein suddenly widened out on Saturday to the full breadth of the shaft, showing splendid ore.

Helena items: The Tanahill lode has an incline shaft sunk on it to the depth of 75 ft. We learn that they have now a crevice of 25 inches of splendid looking quartz. The shaft of Whitney & Co., on the bar opposite No. 5 below discovery in Last Chance Gulch, has been sunk 227 ft., and prospects were found from the surface to the depth of 100 ft. On claim No. 7, in the above gulch, a shaft has been sunk 40 ft., running through pay dirt all the way down, and no bedrock as yet reached.

Letter to same from Atlantic City, Lost Horse Gulch, says: In the discovery claim they have lately struck "big pay," sometimes taking out \$5 to the pan.

From the Helena *Gazette* of March 2d: Turnley's mill, on its last clean-up, made returns of \$6,424.45, from 90 tons of Union rock—an average of \$71.33 per ton. Hendrie's mill, cleaned up on last Saturday \$4,392 from a six days' run on second-class ore from the Union. Accounts from Eagle Creek Dist. are of the most flattering character. Some 20 shafts are being sunk, in all of which good prospects are obtained. The gulch is about six miles long.

#### MEXICO.

The *Bulletin* of March 11th has a letter from Lower California, giving these items: There are but two mills in the country that are prepared to work. One, the Pacheco, is a small one of only four stamps and two furnaces for roasting ore. This mill has been running about two years, most of the time on purchased ores. It is located about a mile above San Antonio, on the bank of the San Antonio Creek. It sends from \$2,000 to \$4,000 in bullion to San Francisco by each steamer. The other is that of the Triunfo Silver Mining and Commercial company, located at Triunfo, a small town about five miles west of San Antonio. The company have just completed their new mill and started to crushing on the 28th of January. The new mill works finely. It has run now nearly three weeks, and I am told that they have crushed and roasted about 100 tons per week, but as their barrels were not fully completed, they have amalgamated but a small portion of what was crushed. Their ore has averaged about \$70 per ton.

#### NEVADA.

##### Black Rock.

The Virginia *Enterprise* of March 16th, says: "We were yesterday informed that a lot of ore—400 lbs.—sent to San Francisco by a gentleman of this city who is interested in the Black Rock mines, yielded a bar of silver worth \$28, or at the rate of \$140 per ton. The ores of that region are said to be of a very peculiar appearance and composition. Much of the ore presents a waxy appearance and is variously tinted—some being black and for this reason termed "black wax." The dark colored, waxy ores are thought to be chlorides of silver, changed by exposure to light and the atmosphere. If such is the case it is not a little strange that our miners and prospectors should not long before this have established the fact beyond all question; the mines have certainly been long enough known to our people, as the district was visited by many persons as early as 1860."

##### Esmeralda.

The Virginia *Enterprise* of March 12th, says the first gold bar from Pine Grove, Wilson Dist., is in town. It weighs nearly 140 ozs., and is worth by assay, nearly \$19 per oz. It is the product of 68 tons of ore, worked in Pray's new mill. This is the finest gold yet found on the eastern side

of the Sierra. Pine Grove is 65 miles south-east of Virginia.

The *Reveille* says it is now settled that Mammoth Dist. is in Esmeralda, and not Nye county.

##### Humboldt.

From the Virginia *Trepass*: Pease is having a perfect success in his Winnemucca mines. At 75 ft. he has a fine 4-foot ledge of excellent ore in the Union Series. He is superintending work for a New York company, expects soon to go to the East to report, and return with the means to erect machinery—for crushing or smelting, as may be deemed advisable.

A Unionville telegram, dated March 13th, says: The Humboldt River Gold and Silver Mining company have purchased the Monroe Series, and will immediately proceed to develop it.

From the *Reveille* of March 2d: Copper Dist., in Humboldt county, about 90 miles north-northwest of Austin, was formerly called Battle Mountain Dist., but was reorganized on the 21st of February. A specimen shown us from the Ericsson ledge, is a mass of red oxide of copper, nearly covered with thin layers of green carbonate. The ledge has been opened by an excavation 30 ft. long and 10 ft. wide, but its width not ascertained.

##### Pahranaagat.

The Reese River *Reveille* of Feb. 27th, learns from Mr. Ritter, just arrived from Pahranaagat, that the 5-stamp mill built by Major Raymond, will be taken down and rebuilt immediately. It was very incomplete and defective, and was altogether unsuitable for the work of reducing silver ore. Under the belief that the ore could be successfully treated without roasting, the mill was erected without reverberatory furnaces. The experiment proved a failure. Furnaces were then built of clay found in the neighborhood. After one or two unsatisfactory trials, the arched roof of the furnaces fell in, and they were abandoned. At the same time the battery was discovered to be useless. It had been placed upon soft ground, into which the bed was gradually sinking. The entire structure was shown to be worthless.

The same of March 2d, says that Colonel Allen, just arrived from Pahranaagat, represents mining matters to be very encouraging in the district, and the anticipation of a lively summer very general. The principal work was being done upon the Illinois ledge, although several other mines were being developed.

##### Reese River.

From the *Reveille* of Feb. 23d: The large specimen of mineral from the Child & Canfield location on the Transylvania ledge, in Silver Bend Dist., presented to Col. Buel for the Paris Exposition, weighs 644 pounds, and is the most splendid specimen of a bright-hued silver mineral ever exhibited in the district.

The superintendent of the Great Eastern shipped to-day sixteen bars of bullion valued at \$18,500.

Same of 26th: A rich chimney has been tapped in the Camargo mine, Marshall Cañon, at the depth of 80 ft. below the surface. The work on the shaft will be suspended for the present, and the ore in the chimney will be extracted for immediate reduction.

A new shaft has been opened in the Gilligan mine, Egan Cañon, 300 ft. from the main shaft. The ledge at the depth of 25 ft., is 5 ft. wide, with smooth walls and rich ore.

We learn that the Knickerbocker mill, in Union Dist., will be set in motion immediately. There are some 200 tons of ore at the mill waiting reduction. Two tunnels are being driven in the Great Eastern.

Same of March 4th: Yesterday the stage from the East brought 2,670 ozs. of bullion from the mill of the Social and Steptoe company, at Egan Cañon.

The Rigby company, at Indian Springs, has a tunnel 300 ft. into Potomac Hill. They are taking out good ore from an incline at the summit. In the Liberty mine rich ore has just been developed, in the level 200 ft. below the surface.

Letter to same from Belmont, March 1st, says: Remarkably rich ore has been developed in the tunnel of the Combination company, on High Bridge.

Same of March 5th: Work in Cortez Dist. is just now confined to the Cortez Grant and the Taylor and Passmore, but there is a good prospect that a number of other mines will be opened and developed the coming season.

Same of 6th: The first Southerly extension of the Murphy has been sold to parties in New York, who have organized the Macdonald Silver Mining company, with a capital stock of \$1,000,000, divided into 10,000 shares of \$100 each.

We are informed that the mill of the Twin

River company is temporarily closed, on account of a strike of the men employed in the roasting department. They are working twelve-hour shifts.

Same of 17th: The Silver Hill mill, which had been leased for the reduction of the ore from the Diana mine, was closed yesterday. We are informed that the ore will be worked for the present at the Parrott mill.

At Mammoth Dist., the Mount Vernou company are taking out some ore from one of their drifts, which will work up to \$200 per ton. Ferguson & Co., in the American Flag, are getting a better quality of ore. Major Gillett, of the Ural company, has sent to the Knickerbocker mill a lot of fine ore from the Gould & Curry. Work continues to be prosecuted on the Sacramento. The Albany series of veins open well.

Same of 8th: The Belmont stage, last night, brought three bars of bullion, valued at \$2,449, from the Twin River company's mill.

We have just been furnished with the result of the reduction of 137 tons of Great Eastern ore at the Keystone. This ore was in two lots of 116 and 21 tons respectively. The average yield of the large lot was \$391.18 per ton; of the small lot of siftings, \$101.50 per ton. The yield of the whole 137 tons, made the grand total of \$47,508.71.

Letter from Belmont, to same of 13th: There have been more rich strikes in the mines here, and the agent of the Combination company has gone to San Francisco to make arrangements for forwarding machinery. The Silver Bend Mining company, D. S. Child, superintendent, is taking out very rich ore, and competent experts estimate the value of that already on their dump at \$50,000. The company will erect a large mill this summer.

We saw to-day four bars of bullion, valued at \$4,185.91, the product of 17 tons of ore from the Taylor and Passmore mine, in the Cortez district.

Three tons of ore from the Bucl and Wood, the Transylvania ledge, Silver Bend district, reduced at the Keystone mill, yielded \$371 per ton.

##### Washoe.

[In the Stock Circular, in another portion of this paper, will be found late mining news from this district.]

From the Territorial *Enterprise* of March 13th: The Yellow Jacket dump is filled with excellent ore. The mill will start up in about a week. The Merrimac mill is running upon tailings saved last year. The Brunswick mill is to be enlarged. The Spanish mill at Empire City is not running.

The Nevada mill, formerly known as the Empire mill, in Six-mile Cañon, is now again in full operation, and doing as good work as any mill in the State. It is running on ore from the Chollar-Potosi mine, reducing about 40 tons per day.

Same of 15th: Day before yesterday the Gould & Curry mill resumed work. The company work none but their own ore. The mill reduces 120 tons of ore per 24 hours. The ore houses of that company are filled, and no difficulty will be experienced in furnishing a supply from this time forward.

The following is a statement of the amount of bullion shipped from the office of Wells, Fargo & Co., during the past week: From this city, 13,794 lbs. of assayed bullion, valued at \$350,920.21; from their office in Gold Hill, 4,760 lbs., valued at \$134,231.44.

FOR THE PARIS EXHIBITION.—A splendid locomotive has just been completed at the Grant Works, at Paterson, New Jersey. All the working parts of the engine are of polished steel, the boiler, boiler cylinders, dome and stack being covered with silver. The "cab," or driver's compartment, is constructed of walnut inlaid with maple and satin woods. The various levers and handles are tipped with ivory, and the whole presents a very gorgeous appearance. The cylinder of the engine is 16-inch bore and 22-inch stroke; the driving wheels are 5½ feet in diameter, and have steel tires. The boiler is constructed for burning soft coal. The cost of the engine was \$45,000, or about \$30,000 more than the cost of an ordinary locomotive.

BEEVES are now slaughtered by a stab between the head and the first vertebra of the neck. The spinal marrow is pierced, and the animal drops at once. It is then suspended by the hind legs, and bled. The old way of knocking on the head was attended with such a shock as to prevent free bleeding. By the "pricking down" process, the meat is made more tender, and is believed to be more wholesome.

## Mining and Scientific Press.

## Canvassing Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting our Agents in their labors of canvassing, by lending their influence and encouraging favors. We shall send none but worthy men.

Mr. A. C. Knox, is our city soliciting and collecting Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office.

San Francisco, Jan 11th, 1866.  
Mr. L. W. Felton, is an authorized agent for this paper at Portland, Oregon. Dec. 1, 1865.

Mr. E. L. Smith, is a duly authorized Agent for this paper. February 25, 1867.  
Mr. Geo. F. Price is a duly authorized agent for the Mining and Scientific Press. March 23, 1867.

Mr. J. M. Quay will act as agent for the Mining and Scientific Press from this date. March 23, 1867.

## San Francisco:

Saturday Morning, March 23, 1867.

(Reported for the Mining and Scientific Press.)

## California Academy of Natural Sciences.

## REGULAR MEETING.

MONDAY, March 18th, 1867.

President in the Chair.

Twenty-nine members present.

L. C. Lane, M. D., Ellis H. Holmes, Wm. K. Rowell, John C. Pelton, J. A. Baner, Elisha Brooks, Robert Hagen and Dr. J. M. Sharkey, were elected resident members, and W. H. Dall corresponding member.

Donations to Cabinet.—Specimen of *Bdelastoma*, presented by Dr. C. A. Canfield, of Monterey.

Specimen of Wolf-fish, presented by Frank Johnson.

Specimen of Gold from South Carolina, presented by Gregory Yale.

A very large and perfect crystal of horax, from the Borax Lake, by Mr. Lightner.

A bald eagle, presented by Dr. Ayres.

Walla, a nutritious Indian preparation, from Mr. Frank S. Alling.

Donations to Library.—Elliott's Botany of South Carolina, in two volumes, by Dr. Kellogg.

Mr. Stearns made some remarks, as to the true habitat of *Helix Ayresiana*, Newc., also upon the unusual size of a specimen of *Orthyoporus analis*, Ayres, which he had noticed in the fish market in October last.

An elaborate Essay on the Conchology of the west coast of America, was presented by the President from Dr. Cooper; referred to the Committee on Publication. Dr. Kellogg presented seeds of the wine plant, a species of rhubarb. Mr. Ewer read a communication from Prof. Blake, on the submerged forests of the Columbiariver. These are fir trees from which the tops have disappeared, the trunk being left standing. They are not seen in high water, but in low water stand at various heights, from a few inches to three feet. They are not petrified, but are decayed on the outside and sound within. Some of the wood was exhibited. From the character of the formation Prof. Blake considered that at the Cascades the river had been filled by the sliding in of the banks, which caused the water to rise and cover the trees for some twenty-five miles above. The Indians have the tradition that it occurred when there was a fight between Mount St. Helens and Mount Hood. The banks are still sliding, but the current of the river carries away the earth, so that at present the river remains the same.

An essay of ores was read by Prof. Whitney, made by a distinguished French chemist, now resident in Peru, South America. The Professor also stated that the fossils found in the Andes in that region would be sent to this city for description, instead of to France, as heretofore. A specimen of coal was presented by Maj. Lyon, from the mines in Weber Cañon, near Salt Lake, who made a few remarks on the geology of the region where it occurs. The coal strata are about nine feet thick. Coal is also found at Beaver City, some 300 miles south of Salt Lake City.

Some interesting conversation was had on the newspaper accounts of the supply of gold which the French Emperor was supposed to have obtained secretly from Africa, and Captain Burton's theory of the gold to be found there, and his efforts to secure patronage to explore those regions.

The Society contemplate a field excursion as soon as the weather shall be thought settled.

## Artificial Ice.

## THE MANNER AND COST OF ITS MANUFACTURE.

Much attention has been paid, of late years, to devising ways and means for the artificial production of ice, on a scale of economy which will admit of successful competition with its natural production, where much cost is necessarily added for transportation and storage. Investigation and experiment, in this direction, seem to have recently been brought to its utmost limit of economy; and large amounts of artificial ice are now made, not only in warm latitudes, and at long distances from any natural supply, but even in the very midst of those localities where the greatest amount and purest of natural ice can be most advantageously obtained. Even in the city of Cleveland, Ohio, where the purest ice, several feet in thickness, is formed every winter within the city limits, it is found to be more economical to produce ice by artificial means, as it is wanted, than to obtain it from the lake in the winter, and store it away for summer use. The cost of handling and storage; the inconvenience of having it in irregular blocks, and the inevitable loss from melting, more than counterbalances the difference between the ultimate cost of the artificial and the natural product.

Various devices have long been known to chemists for obtaining low degrees of temperature; but those which are employed in the laboratory are quite too expensive for the commercial production of ice. Among the various compounds for producing an intense artificial cold, we may mention the following:

Three parts of sulphate of soda, and five parts of nitrate of ammonia, pulverized and mixed with four parts of nitric acid, diluted with seven parts of water, will produce a degree of cold represented by 45 degrees of Fahrenheit—below the freezing point of water. Three parts of sulphate of soda, pulverized and mixed with two parts of nitric acid, and diluted with seven parts of water, will produce a temperature of 38 degrees of Fahrenheit—below the freezing point. Five parts of sal ammoniac (chloride of ammonia), and five parts of saltpeter, pulverized and mixed with sixteen parts of water, will give a temperature 18 degrees below freezing. The cheapest preparation which will produce any very considerable degree of cold, without the addition of ice or snow, is a mixture of equal parts of sulphate of soda and sulphuric acid, the latter diluted with two parts of water. The cold produced will be four degrees below the freezing point.

There are various other compounds which will produce a low degree of temperature; but, as already stated, they are serviceable only on a small scale, in the laboratory, where the item of expense is not taken into account.

Artificial ice, as a commercial product, is produced in two ways—one by means of the vaporization of exceedingly volatile fluids, such as ether, ammonia, etc.; and the other by the expansion of common air, which has been previously compressed.

## THE VAPORIZATION PRINCIPLE

Consists in extracting the heat from water, by means of the rapid evaporation of ether, ammonia, naphtha, etc., and in so doing reducing the temperature of the water sufficiently low as to cause its rapid refrigeration. Students of chemistry are familiar with the lecture-room experiments illustrative of the great degree of cold produced by the rapid evaporation of fluids. Ether and ammonia, by reason of the readiness with which they are made to vaporize, have generally been employed in the manufacture of ice. Any of the lighter hydrocarbons—such as chimogene, benzine, naphtha, etc., or hi-sulphido of carbon would answer the same purpose. More or less danger, however, is inevitably connected with the use of all the above named fluids, with perhaps

the exception of ammonia, from the readiness with which they burn or explode when coming in contact with the atmosphere at even a very low degree of heat. Numerous accidents have occurred from their use.

The principle of the use of either of these fluids is the same; but the mechanical contrivances by which that principle is applied, are quite various. The object of the experiments alluded to at the outset of this article, has been to devise some simple, ready and effective means to render the use of this principle safe, and at the same time to save the evaporating fluid from escaping from the machine. Machines have consequently been devised by which, when the evaporating fluid is vaporized, it is conducted into another part of the machine where it is condensed, and subsequently brought back, to be again vaporized, and make the refrigerating process continuous. By the use of these machines this process can thus be repeated *ad infinitum*, without losing any of its ammonia, etc., so long as it remains in order—and such a machine will last a long time. None of the agents employed come in direct contact with the water which is to be frozen.

In the use of these machines, fuel and power are required to promote evaporation, to handle the water and ice, and to manipulate the machine. It is stated that an ether machine is in operation in Cleveland, Ohio, which will produce ice at a cost of a fraction less than \$3 per ton. Ten tons are said to be the daily product of this machine, at the following cost:

Two cords of wood.....	\$10 00
One engineer.....	3 00
Two firemen.....	3 00
Contingent expenses.....	10 00
Cost of ten tons of ice.....	\$26 00

These figures, converted into San Francisco prices, will not much, if any, exceed \$4 per ton, or about 18 one-hundredths of a cent per pound—about half the cost of delivering natural ice, by the cargo, at any point in this city. The annual consumption of ice in San Francisco does not vary much from 1,000 tons; which is retailed at five cents per pound. The profits of such an enterprise would allow a large margin in our figures. The cost of such a machine to supply this market, apart from the necessary power to operate it, will cost \$6,000 in Paris, where alone they are manufactured.

## THE USE OF COMPRESSED AIR.

The dangers and difficulties attendant upon the above mode of manufacturing ice, induced certain scientific gentlemen, some fifteen years ago, to set about devising some substitute for the use of ether, etc. One Dr. Gorrie, acting upon an idea derived from some experiments which had previously been made by Gay Lussac, on the great amount of cold consequent upon the sudden expansion of compressed air, constructed an apparatus in New Orleans, in 1851, which would freeze water exposed to condensed air, in the act of being allowed to suddenly expand to its normal condition. The experiment was pronounced a complete success.

A similar set of experiments were made about ten years later, in 1862, in England, and reported to the British Association, where they were illustrated by diagrams, etc., and elicited much commendation. An apparatus was constructed for the manufacture of ice on a large scale, which, for ought we know, is in operation to this day. The machine was reported to be an extraordinary success; being operated night and day without intermission, and without trouble. The cost of the apparatus, without power, was about \$3,000.

The principle of this mode of obtaining ice may be described as follows: If we enclose a quantity of air in a strong vessel, into the top of which we fix a piston, as in the ordinary syringe, and force the piston down with the hand, we shall compress the enclosed air, which, by the power so exerted will be heated. Now, if we cool that air down to its original temperature, and allow

it to suddenly force the piston back, the air, by the consequent expansion, will have its temperature still farther and greatly reduced. The greater the density employed, the greater is the cooling effect. The effect of this cooling on water placed in contact therewith, can readily be conceived. To render such a machine practicable, the compression or heating operation, and the expansion and cooling, must be done in separate compartments. The air, when compressed, should be surrounded by cold water, to extract the heat generated by the compression; and the water to be frozen should be surrounded by a strong brine, which may be cooled to a low temperature without freezing, in order to extract the heat from the pure water to be frozen.

One great mechanical difficulty in the way, has been the devising of some means to readily extract the heat generated by the compression, before the air comes in contact with the brine to be cooled by the expansion of the compressed air. The accomplishment of this object in such a manner as to render the process convenient and economical, has been the study of many scientific minds. The well known principle of Stirling's refrigerator and inspirator, composed of wire gauze, has generally been employed to that end. The reservoir into which the compressed air has been forced, is divided into two compartments, separated by several layers of fine wire cloth, so that the air, in passing from the first or hot compartment to the cold one, warms the wire cloth and is itself cooled, while the cold air, in returning, is gradually warmed, cooling the wire in its course.

What appears to be a decided improvement over this arrangement of compartments separated by wire cloth, has been put into our hands by a gentleman of this city, who is taking the necessary steps to patent the same. This arrangement consists in cooling the compressed air by passing it through copper tubes immersed in water, much after the manner of a steam condenser. We have a rough sketch of the plan, which we are authorized to submit to the inspection of any party who may have in view the idea of embarking in the manufacture of ice, or of machines for accomplishing that purpose.

DELICATE MANUFACTURE.—The manufacture of steel fuse watch chains is carried on extensively at Hants, England. So delicate is this manufacture, that young girls with delicate touch are chiefly employed in the final manipulations. Each chain is about eight inches long, and contains upwards of 500 links riveted together! The chain is not thicker than a horse hair, and the separate links can just be perceived with the naked eye. These chains have been manufactured at that locality for about 100 years; and modern invention has not yet been able to devise a substitute for this chain—equal to it in slenderness, strength and flexibility.

The delicate work which the human hand is capable of producing, exceeds, by far, anything which can be accomplished by machinery. The finer woven fabrics of the East are the work of human fingers alone. Those who are engaged in producing the finest, are never allowed to do any other class of work, in order that the delicateness of their fingers and their nicety of touch may not only be kept at its highest standard, but also cultivated to its utmost limit.

CRANBERRIES.—Mr. James Creighton, of Placerville, El Dorado county, writes us that he ordered some four or five hundred cranberry plants from Maine, last winter. He set them in a piece of ground which had been "mined out," and afterwards filled up. Although set out late, they did well, until a rush of water and tailings from above covered them, and destroyed all but about a dozen. Not disheartened, Mr. C. has ordered another lot, which are already on the way. He has not a doubt that they will do well in California.

## Mechanical.

## Firth's Steel Works, Sheffield, England.

Iron, in its various forms, is universally admitted to be the most wonderful and the most useful of all the mineral productions of the earth; and when it is converted into the form of steel, we have the very concentration of everything that is excellent in that invaluable metal. The manufacture of steel is a most skillful operation, and it is only from the very best ores of iron that really good steel can be produced. The town of Sheffield, in England, may be looked upon as the birthplace of steel, in extensive, merchantable quantities. With one or two unimportant exceptions, that town still supplies the entire amount of British steel which finds its way so universally over the civilized world. Berlin, it is true, has its Krupp, whose monster establishment is a worthy rival of the famous Yorkshire establishments. Nearly all the trade of Europe, outside of Sheffield, is concentrated in the hands of that renowned producer. The works of Krupp are considerably larger than those of any other similar establishments, several of which approach very nearly in extent to that of the renowned German. Each and all of these English works have their special excellencies, and each and all of which are busy and energetic competitors with each other. Most probably the superiority of British steel is owing to this very fact. There is nothing like competition to sharpen the wits.

Among the Sheffield works there is one, not so well known, perhaps, in this country as one or two other firms in that town, but which, nevertheless, is inferior to none in the excellencies, both general and special, of its manufactures. Thomas Firth & Sons, of Sheffield, is a firm whose resources are truly national in character, and which has sometimes been called the "Krupps" of England.

Their steel works, alone, occupy eight and a half acres of ground, densely covered with workshops, which, with their machinery, is valued at \$1,000,000. On the opposite side of the street from these steel works, is located their extensive works for cannon, shot and shell, locomotive and rail-car wheels, wire for telegraph cables, mines, etc. These works cover an area but little short of the neighboring steel works. In addition to these, they have also large water-power works, located at several convenient river points near town; besides still other works for the manufacture of puddled steel and iron for the building of ships, railway carriages (iron railway carriages are becoming quite common in England), bridges, telegraph posts, etc., etc. They also carry on extensive file making works.

This firm produces all the steel which the Royal Arsenal converts into guns, and most of the 7, 8 and 9-inch steel guns of the Royal Navy, as well as the famous Woolwich 300 and 900 pounders. The two largest steam-hammers in the world are to be found in these works—the anvil block of the largest of which weighs 175 tons, and was moved into its place from the pit where it was cast by jack-screws—a sixteenth of an inch at a step! The rolling works are graded for turning out plates from the heaviest armor down to the thinnest plates for crinolines and steel pens—the latter being rolled out with polished, chilled iron rollers, kept constantly as bright as plate-glass mirrors.

The high reputation which the steel of this house has attained, is due to the great care and special knowledge devoted to the "conversion" process. Much of this knowledge and experience is kept a secret from the world. The attention devoted to this particular branch of the business is the basis of the success attained by these unequalled works.

This business was originally founded by two brothers, with their father as the head. Three other brothers have since been taken

into the firm, each of whom presides over a particular department, while the whole is under the energetic and skillful direction of the older brother, Mark Firth.

It is interesting, once in a while, to pass in brief review some of the most important establishments of other localities and other countries than our own; to the end that such descriptions may act as stimulants to our own people to strive also to arrive at prominence, and acquire fame as well as fortune, in being the representative men of their class and calling. We learn also that the steel of this firm is now being quite extensively introduced into this city, and from the perusal of the above it may be interesting to some of our readers, while they are appreciating the superior quality of their manufactures, to be able at the same time to form a just estimate of the magnitude and character of the works whose products they are employing.

**CHECKING HEADWAY.**—It has been stated in the *Steam Shipping Journal* that a 3,000 ton steamship, with 800-horse engines, has been checked, when running at full speed, her engines reversed and steam-way gathered, within three times her own length or 1,000 feet. It was recently stated in the *Railroad Gazette* that a brake had been invented which would bring a railroad train from full speed to a stand-still, in sixteen seconds of time.

**RESTORING FIBROUS TEXTURE TO IRON.** It has been said that railway axles, and other constructions of iron, subject to jarring, which often become weak after a few years' use, as is supposed from a change of their fibrous structure to crystalline, may have their fibrous condition restored by heating and gradually cooling them.

**BOILER IRON.**—A correspondent of the *Scientific American* very properly suggests that a series of experiments, to ascertain the tension strain of the boiler iron manufactured at the various manufactories in this country would be of vast importance. It would well reward the owners of steam boilers to pay three times the price for good iron instead of bad. Under such circumstances the manufacturer ought to warrant the tensile strength of his iron. If found wanting attach the penalty.

**TRUEING GRINDSTONES.**—J. G. Garland, of Maine, and John King, of Conn., both send to the *Scientific American* similar instructions for trueing grindstones when first hung and also when worn out of round. The plan, which is as follows, appears to be feasible: In the same frame with the stone to be used suspend another—a nearly worn out stone will do—so that the faces shall run together. The small stone has a cam on one end of the shaft and journals longer than the boxes so that it has a traverse across the face of the larger stone. The faces of the stones are adjusted by right and left screws for setting up the boxes of the razing stone.

**MECHANICS' INSTITUTE.**—An adjourned meeting of this association was held on the evening of March 18th. The committee appointed to confer with the owners of the new market building, reported that the said building could not be had for fair purposes. After some debate on the question of erecting a temporary building, it was finally resolved that the Institute hold a fair in August or September, 1868, and that the Board of Directors be instructed to secure a suitable location.

The new building of the Institute will be formally opened on the evening of Tuesday, March 26th. A general invitation to be present is extended to members and friends. Hon. Nathan Porter will deliver the Inaugural Address, and Hon. Frank Soule a poem. These proceedings will commence at eight o'clock P. M., in the lecture hall on the first floor.

**GASTON'S SCREW AMALGAMATOR.**—Three of these pans were shipped on the 16th instant to Placerville, El Dorado county. They are intended to be used for working the tailings of the old Pacific mill.

## New Patents and Inventions.

Under this heading we shall mention, from week to week as occasion may demand, new and important inventions also, the list of Patent claims recently issued from the U. S. Patent Office to inventors on the Pacific Coast, and other Patent issues which we deem of local interest to readers on this side of the Continent. Most Patents on this coast are secured through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We are prepared to obtain from Washington, with despatch, copies of any Patent issued.

## RECENT INVENTIONS.

**IMPROVED FIRE LADDER AND HOSE CARRIAGE.**—One of the latest improvements in aid of the arduous and important duties of our metropolitan firemen, has recently been devised by Mr. George K. Foster, of this city, and consists of a combination of ladder and hose carriage, so constructed and operated, that upon its arrival at the scene of conflagration, a ladder, with one or more firemen, each with an independent hose and pipe, can be almost instantly elevated to the third or fourth story of a building, and that, too, without any communication whatever with the building itself, or any other structure than that connected with the ladder and carriage itself. While this is being done the lower portion of the hose can be connected with the hydrant or engine, and a stream of water be at once thrown directly into an upper story window or upon the roof; or the ladder may be as readily inclined to the building to allow the firemen to enter through a window and convey his pipe directly to the locality of the fire.

The device is a most ingenious application of machinery to the purposes described. In the first place we have a four-wheeled truck, from the frame of which a series of jointed ladders is made to rise, exactly after the manner of the device known as "lazy-tongs," being worked by two winches, one on each side of the truck frame. The ladders are jointed, like carpenter's rules, and when the truck is passing to or from a fire, or remaining at rest in the engine house, they lie flat and close on the top of the machine. They are secured and braced by "lattice bracing," so that each joint supports and strengthens every other joint. As they rise, they are made to carry up one or two lengths of hose, and when up, a fireman can readily ascend and descend at pleasure, or he can be carried up with the ladder as it is elevated.

Two segmented wheels are so connected with the ladder that it may be readily inclined forward to or back from the building to an angle of about 45 degrees, or it may be thrown from the building on one side of the street to the other without moving the truck. By this arrangement it may also be readily adjusted to the second or fourth story of a house. Proper stays are attached to give greater firmness to the ladder when raised; and when it is necessary to reach a great height, guy-ropes may also be added. Reels for any desirable length of hose are attached to each side of the truck. The entire machine is a very ingenious piece of mechanism, and well adapted to the purpose for which it is designed. It is highly approved of by our present eminently practical chief engineer, F. E. Whitney, and indeed by all who have examined it. The model on exhibition is a beautiful and highly finished piece of work, and is from the Vulcan Forge Machine Shop, on Sutter street, between Sansome and Montgomery. It will be on exhibition at the opening of the new Mechanics' Institute building, on Tuesday and Wednesday evenings next, after which it will be deposited, for the present, at the office of the Chief Engineer, on Kearny street, near Bush. A patent for this invention has been allowed through the agency of this office.

**ADAMS' HYDRAULIC PRESSURE WHEEL.** This wheel is constructed on a principle quite unlike any other with which we are conversant. The wheel itself is built very much after the form of an ordinary water wheel, but of small diameter. The water as it comes from the penstock, or ordinary water pipe, is conducted into a segmental, hydraulic trough, fixed to the frame-work of the wheel, and so constructed as to pass under the periphery of the wheel for nearly half its circumference; the face of the wheel forming the upper covering of the trough. The wheel, of course, as it revolves, must form a continuously moving water-tight joint with the two upper edges of the trough. The buckets are made like those of a common stream wheel; but so constructed as to be drawn back within the circumference of the wheel, except when that circumference is in contact with the trough. As the buckets pass into the trough, they are successively thrown out by the force of the water itself, acting through a pipe and piston ingeniously contrived for that purpose. There

is a pipe and piston for each bucket. The instant the face of a bucket passes the water-gate at the entrance into the trough, the bucket itself is thrust out into the stream, filling an entire section of the trough, and of course taking the full head of the water until it has passed to the other extremity of the trough. Here it is drawn back, so as to avoid coming in contact with the end-piece of the trough, and retains its contracted position until it once more arrives at the gate. So with each bucket in succession. It will thus be seen that by this device a considerable leverage is obtained—proportioned to the diameter of the wheel—in excess of hydraulic wheels of ordinary construction. The wheel is quite simple, and the inventor is confident of its practical success. A working model may be seen in charge of Mr. J. H. Stockman, over Garratt's Brass Foundry, on Fremont street. A model may also be seen at this office. A caveat for this invention has been filed through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. The inventor resides near the Clipper Mills, Butte county.

**Builders' Insurance Company.**  
OFFICE IN THE BUILDING OF THE  
CALIFORNIA SAVINGS BANK, California  
street, one door from Sansome street.  
FIRE AND MARINE INSURANCE. 10v14t9pqr

## A Paying Newspaper for Sale.

A one-half interest in one of the best Country Papers in the State, is offered for sale on desirable terms. The journal is the oldest in the county, is situated at the County Seat, and surrounded by one of the most prosperous and promising Quartz and Gravel Mining Districts in the State. Inquire at the office of the *Mining and Scientific Press*; or address DEWEY & VAUGHN Mountain Messenger office, Downsville, Sierra County, Cal. 7v14tf

## To Capitalists.

**GOLD QUARTZ MINE, SITUATED IN CALAVERAS** County, with steam mill fitted up with Amalgamating Pans, etc., FOR SALE. The mine has three main veins, and more than \$80,000 have been spent in opening them and completing the mill. Good wagon roads all the way. Apply to BELLOC FRERES, Bankers, 635 Clay street, San Francisco. 23v13-6m

## Quartz Mill Construction and Superintendence.

THE UNDERSIGNED IS AT PRESENT OPEN FOR AN engagement as a working Superintendent in the construction or operation of a Quartz Mill. Has had five years steady and successful experience in working ones in Washoe, and is practiced in saving sulphurets and the treatment of rebellious ores. Is prepared to furnish references for all the necessary qualifications of an intelligent, faithful and reliable quartz mill operator. Address F. M. SAWYER, San Francisco, care Mining and Scientific Press. 10v14-3m

## PACIFIC Rolling Mill and Forge Co., SAN FRANCISCO, CAL.

Established for the Manufacture of  
**RAILROAD AND OTHER IRON**  
—AND—  
**Every Variety of Shafting,**  
Embracing ALL SIZES of  
Steamboat Shafts, Cranks, Pistons and Connecting Rods, Car and Locomotive Axles and Frames.  
—ALSO—  
**HAMMERED IRON**  
Of every description and size.  
Orders addressed to PACIFIC ROLLING MILL and FORGE CO., Post Office, San Francisco, Cal., will receive prompt attention.  
The highest price paid for Scrap Iron. 9v14-3m3p

## A. S. Hallidie &amp; Co., MANUFACTURERS OF FLAT &amp; ROUND WIRE ROPE.

For Mining, Shipping, Ferry, AND GENERAL PURPOSES.  
Office—412 Clay street, ..... Works—North Beach SAN FRANCISCO.

**NOTICE.**—THE FIRST COST OF WIRE ROPE IS MUCH less than that of any other kind of Rope of equal strength, and it is four times as durable. Wire Rope does not stretch or shrink by atmospheric changes; it has but one-fifth the bulk of Hemp Rope; is spliced and repaired in the same manner.

The attention of Mining Companies is particularly called to our Flat and Round Hoisting Ropes, which have been in use for a number of years by the leading mines on this coast, and to any of whom we refer those interested as to the great advantages over any other kind of rope; effecting a immense saving in expenditure for ropes, fuel, wear and tear of machinery, stoppage of works, etc., besides increasing safety of life.

Mining Companies, in erecting Hoisting Works, should be sure and have their drums and pulleys of sufficient size, whether for wire or hemp rope.

We manufacture of all sizes, and in any length—  
**Round Wire Rope**—Iron or Steel, for Hoisting.

**Flat Wire Rope**—" " " "

**Soft Steel Wire Rope**—For Derrick Fall Ropes—very strong and durable—one third the weight of hemp of equal strength, (saving in freight for remote localities), suitable sheaves and blocks furnished when required.

**Galvanized or Ungalvanized Round Wire**—For Ships' Rigging, Derrick Guys, Ferry Ropes, and all standing purposes.

**Steel Ferry Ropes**—For wide streams, Ferry Blocks supplied.

**Iron and Copper Wire Cord**— $\frac{1}{2}$  to  $\frac{3}{4}$  inch diameter, for hanging window shades; Signal Cord; Sash Pulleys on hand.

Comparative Weight, Size and Strength of Iron Wire Rope, Steel Wire Rope, Hemp Rope, and Chain.

Iron Wire Rope.	Steel Wire Rope.	Hemp Rope.	Chain.	Equivalent Strength.

Figures containing data, with prices annexed, forwarded free, by mail or express, on application to manufacturers. 25v13-6m3p

Established in 1849--Corner First and Mission streets, San Francisco.

HAVING INCREASED OUR FACILITIES IN EVERY DEPARTMENT, WE ARE NOW prepared at the shortest notice and at the most reasonable rates, to furnish all kinds and description of Machinery, including Steam Engines, Quartz Mills, Mining Pumps of all kinds, Hoisting Gear, Gas Work, Laundry Machinery, Architectural and Ornamental Castings, Sugar Mills, Saw and Flour Mills, Water Wheels of all kinds, Hydraulic, Hay, Raz, screw and Drop Presses, Coluing Machinery, Pile Drivers, Bark and Malt Mills, and all kinds of Castings.

**ENGINES.**—Marine Engines, Oscillating and Beam; Stern and Side Wheel Boats, Locomotives, Stationary Engines, Horizontal Upright, Oscillating and Beam, from six to fifty inches diameter. Also, Scott & Eckart's Adjustable Out-of-Regulator—best in use, W. R. Eckart's Balance Valve for Stationary Engines, Woodward's Patent Steam Pump and Fire Engine.

**BOILERS.** Locomotive, Flat, Tubular, Upright, Cylinder and Cornish, and every variety of Boiler Work. All sizes of tubes and pipes for pumps.

**PUMPS.**—The Excelsior double-acting Force Pumps are manufactured by us. These very superior Pumps are warranted the best, and are fast replacing all other Force Pumps.

**AMALGAMATING MACHINERY.**—Wheeler & Randall's improved Tractory Curve Pan, Zenas Wheeler's improved flat bottom pan, Beldin's pan, Veatch's tubs, Fryer's concentrators, Wakley's pans, Rees' pan, German Barrels, Arastra Gearing, Chile Mills, Settlers of all descriptions, Rotors of all sizes and shapes, for Silver and Gold. Portable Stamp Mills, Straight Batteries, for wood or iron frames, Dry Crushing Batteries, or machines with the latest improvements, every variety of Stamps, Mortars, Camis, Fans and Tubs. **BLAKE'S PATENT QUARTZ CRUSHERS**, of all sizes.

**OIL BORING TOOLS AND MACHINERY.**—Of the latest and most approved construction, made from drawings lately made by Prof. Blake at the oil wells in Pennsylvania. We have the facilities for working gold and silver quartz and other ores, to test their value, by the hundred weight or ton.

Russia Iron Screens, of all degrees of fineness and of all qualities of iron. All work done in the best manner at the lowest cash prices.

H. J. BOOTH & CO.

## Machinists and Foundries.

PALMER, KNOX & CO.,  
Golden State Iron Works,Nos. 19, 21, 23 and 25 First Street,  
SAN FRANCISCO.

MANUFACTURE ALL KINDS OF

## MACHINERY,

## STEAM ENGINES AND QUARTZ MILLS

OUNBAR'S IMPROVED

## Self-Adjusting Piston Packing,

Requires no springs or screws; is always steam tight; without excessive friction, and never gets slack or leaky.

WHEELER &amp; RANDALL'S

## NEW GRINDER AND AMALGAMATOR

HEPBURN &amp; PETERSON'S

AMALGAMATOR AND SEPARATOR,  
Tyler's Improved Water Wheel,

Giving the greatest power, at lower cost, than any wheel in use. There are over 1,500 running, giving universal satisfaction.

KNOX'S AMALGAMATORS,

WITH PALMER'S PATENT STEAM CHEST,

A NEW SEARCH FOR AN OPEN POLAR SEA.  
Mons. Gustave Lambert, a member of the  
French Geographical Society, has projected an  
expedition, the object of which is to  
reach the open Polar Sea. He believes that  
the existence of great currents running north  
and south in high latitudes, can only be  
explained on the hypothesis of such a sea.  
He prefers the route by the west coast of  
Nova Zembla. He says "the route is staked  
out by the monsters of the deep;" alluding  
to the whales, which, when steadily pursued  
northward, run for the Polar Sea.

ROLLS FOR ROLLING MILLS.—Letters pat-  
ent, says the *London Colliery Guardian* of  
Jan. 26th, have been granted to Mr. Caleb  
Thomas Hill, of Pelsall, iron molder, for  
"improvements in the manufacture of rolls  
for rolling metals." These rolls are ordi-  
narily made of cast iron, the roll with its  
necks and ends for coupling being cast in  
one piece. This invention consists in mak-  
ing them with an axis of steel or case-hard-  
ened iron, upon which axis the roll is cast.  
By this method the rolls are made much  
stronger than as ordinarily manufactured,  
and a commoner kind of iron can be em-  
ployed. The axis is supported in the mid-  
dle of the sand or other mold, and the iron  
is cast upon or around it. The roll is  
turned and finished in the ordinary manner.

THE annual coal product of Pennsylvania  
is worth as much as the annual gold product  
of the Pacific States.

putation of having built ONE HUNDRED AND SEVENTEEN

STEAM ENGINES.

Screw Propellers of all kinds, and Steam Boat Machinery,  
generally, made to order, and warranted to give perfect  
satisfaction in every particular. 25v12-3m

**A TERRIBLE DEATH.**—A musician belonging to one of the French regiments has just met with an extraordinary death at Vera Cruz. He was engaged to play at a ball, and being very thirsty went out into the garden, and finding a water bottle on the terrace, took it up and drank freely. Suddenly he raised cries of agony, and upon assistance arriving, it was found that an enormous centipede had fixed its mandibles in his throat. The animal had taken up his abode in the neck of the bottle, and was washed into his mouth in the act of drinking. A surgeon who was called was obliged to cut it to pieces, but the poison from the bite caused death in a few hours.

**FLOATING ISLANDS.**—The inhabitants of the celestial empire construct immense bamboo rafts, on which a layer of earth is spread, and this being planted, soon forms a vast field covered with vegetation. The man erects his tent in the center, and then trusts himself with his family to the waters. This moving oasis usually drifts about at the mercy of the winds, but if required to be directed, is provided with masts and sails, or with cables and anchors for rendering it stationary. An island is to be built after this style upon the Seine, as one of the curiosities to be seen the coming season at the Paris Exhibition.

THERE are about 2,000 persons at the Maloe gold mines, Canada, among whom are many Californians. No person is allowed to mine without a Crown gold lands license or private license, which costs one and two dollars per month. The excitement is abating.

#### To Owners of Copper Mines and Smelting Works.

A PERSON OF LARGE EXPERIENCE IN COPPER Smelting, both in the Atlantic States and California, wishes a situation as Superintendent of an establishment for Smelting Copper. Address "W," care of Mining and Scientific Press. 5v141f

F. E. WEYGANT, Proprietor.

### THE PACIFIC IRON WORKS,

First & Fremont Sts., between Mission & Howard, San Francisco.

The proprietors of the above Works invite the attention of all parties interested to their greatly improved and unequalled facilities for manufacturing Steam Engines and Boilers, both Marine and Stationary, of any required size and pattern, Quartz Mills, Amalgamating, Pumping and Hoisting Machinery of the most approved construction. Flour, Saw, and Sugar Mills, Water Wheels, &c., &c. Our pattern list is most complete and extensive, embracing the late improvements in all classes of machinery adapted to use on this coast. We would call especial attention to the fact that we have secured the exclusive right of manufacture for the Pacific Coast of the celebrated Green Engine, conceded to be the most economical and perfect working Engine now in use. We are also exclusive manufacturers of the celebrated

Bryan Battery, Varney's Amalgamators and Separators, Ryerson's Superheated Steam Amalgamators and Rotary Crushers, Stone Breakers, &c. Orders respectfully Solicited.

**GODDARD & COMPANY.**

### ROWLAND, WALKER & CO., GROCERS,

### REMINGTON'S ARMORY.

Agency, 310 Washington st., San Francisco.  
**PRICES REDUCED!**

These arms have been preferred by the United States Government, and stand unequalled by any in the world. Revolvers, Army, Navy, Belt and Pocket, Double and Single Action; Repeaters, and vest-pocket Pistols, with copper ammunition; Police Revolvers, a new model, navy size ball, 4 1/2 to 6 inch barrel; Rifle Guns—an entirely new Arm—having a range and accuracy equal to a rifle, and a most perfect Case. All the new models for sale very low.  
12v131f

**ALBERT E. CRANE.**

**Economy in Advertising.**—The Mining and Scientific Press is the best and most economical mining advertising medium in this city. Our terms are less than one-half the rates now charged by daily newspapers, and the mining community are beginning to appreciate our reasonable rates of advertising. The Press contains, proportionally, a larger amount of mining advertising than any other paper on the Pacific coast. Its character renders it the proper journal for the concentration of mining patronage.

EUROPEAN  
METALLURGICAL WORKS,

—AND—  
**Practical Mining School,**  
Bryant Street, Between Third and Fourth,  
SAN FRANCISCO.

THE Proprietors are at all times prepared to work or test  
Ores sent to this establishment—either in large or small  
quantities—by such process as may be found best adapted to  
their chemical character, after a careful analysis has been  
made. Test lots of Ore adapted to the smelting process in-  
tended to. Sulphuret, pyrites, and the so-called "rebel-  
lots ores," are having especial attention paid to their suc-  
cessful treatment. Assaying in the humid and dry way.  
Also, refining by cupellation, done at moderate rates.

**PRACTICAL MINING SCHOOL.**  
The proprietors—encouraged by numerous applications  
from gentlemen desirous of pursuing the study of practical  
metallurgy—have concluded to admit parties on reasonable  
terms. Having in their Mill all the necessary appli-  
ances for crushing, roasting, amalgamating, smelting,  
refining and assaying, as also a well extended Laboratory  
for the analysis of Ores and Minerals, a good opportunity is  
here offered to acquire a sound practical knowledge of the  
business.

Pacific Mail Steamship Co's  
THROUGH LINE TO NEW YORK,

Carrying the United States Mail.  
LEAVE FOLSOM STREET WHARF, AT 11  
o'clock A. M. of the following dates, for  
PANAMA, connecting via Panama Railroad, with one of  
the Company's splendid steamers from ASPENWALL for  
NEW YORK.

On the 10th, 18th and 30th of each month that has  
30 days.  
On the 10th, 18th and 30th of each month that has  
31 days.  
When the 10th, 18th and 30th fall on Sunday, they will  
leave on Saturday preceding; when the 31st falls on Sun-  
day, they will leave on Monday following.  
Steamer leaving San Francisco on the 10th touches at  
Manzanillo. All touch at Acapulco.  
Departures of 14th or 18th connect with French Trans-  
Atlantic Co.'s steamer for St. Nazaire, and English steamer  
for South America.  
Departure of 10th connects with English steamer for  
Southampton, and P. R. R. Co.'s steamer for Central  
America.

Departure of the 20th connects with English steamer for  
Lima, the port of the new ships.  
The following Steamships will be dispatched on dates as  
given below:  
March 9th—SACRAMENTO, Capt. J. M. Cavarly,  
Connecting with HENRY CHANCEY, Capt. Gray.  
March 19th—CONSTITUTION, Capt. W. F. Lapidge,  
Connecting with OCEAN QUEEN, Capt. Maury.  
March 30th—GOLDEN AGE, Capt. Jas. T. Watkins,  
Connecting with the RISING STAR, Capt. Furber.  
Cabin passengers berthed through. Sargage checked  
through—100 pounds allowed each adult.  
An experienced Surgeon on board. Medicine and attend-  
ance free.  
These steamers will positively sail at 11 o'clock. Passen-  
gers are requested to have their baggage on board before 10  
o'clock.  
Through Tickets for Liverpool by the Inman Line, can  
be obtained at office P. M. S. S. Co., San Francisco.  
For Merchandise and Freight apply to Messrs. WELLS,  
FARGO & CO.

The splendid steamship COLORADO will be dis-  
patched on WEDNESDAY, April 3, 1867, for Hongkong, via  
Kauaiawa, carrying passengers, mails and freight.  
For passage and all other information, apply at the Pa-  
cific Mail Steamship Co's office, corner of Sacramento and  
Leidsdorff streets.

Mining and Scientific Press Patent Agency, Newspaper and  
Job Printing Office,  
505 Clay Street, San Francisco.

A. T. DEWEY. W. B. EWER. C. W. M. SMITH.

A Word to Readers in the Atlantic  
States.

Much complaint has reached us, through  
various sources, at the general lack of  
knowledge at the East, with regard to mining  
and other operations on this coast, and the fre-  
quent impositions practiced upon the public  
there, in consequence, by irresponsible per-  
sons passing off upon unsuspecting victims  
worthless mining stock, or persuading them,  
by false representations, to organize com-  
panies and advance moneys upon worthless  
ground, or ground which oftentimes has  
neither value or locality. If our friends at  
the East, who are still anxious to engage in  
the laudable venture of mining enterprise,  
would do so intelligently, let them subscribe  
for and carefully consult the only journal on  
the Pacific coast where every mining enter-  
prise that is worth naming is, from time to  
time, noticed, as its merits may warrant. A  
mining enterprise on the Pacific coast, which  
is not referred to in this journal, in some  
way or other, as often as once in three or  
four months, is certainly one which people  
in the Atlantic States should beware of.  
Our advice to people at the East is never to  
venture small amounts in mining. If you  
must start small, let a number of such club  
together, so as to make the aggregate amount  
to be invested, such as may be worth your  
while to inquire into. Jan. 1, 1867.

ESTABLISHED [MAY, 1860.]

VOLUME FOURTEEN

—OF THE—

## Mining and Scientific Press,

COMMENCING JANUARY, 1867.

DEWEY &amp; CO., Publishers.

Issued every SATURDAY, at our Book and Job Printing  
Office, 505 Clay street, corner of Sansome, SAN FRANCISCO.

**Terms in Advance.**—One year, \$5; Six months, \$3;  
single copies, 15 cents; Monthly Series, \$5.50 per year, or  
65 cents per number. Back Volumes from January, 1864, \$3  
per volume; bound, \$5 per volume.

The Mining and Scientific Press is now thoroughly es-  
tablished, and enjoys one of the largest and most permanent  
subscription lists of any weekly journal on this coast. The  
individual character and reputation of its constant patrons  
throughout the entire coast is one of the best recom-  
mendations of its merits and value as a medium of intelligent pro-  
gress and prosperity.

Issued by the United States or Foreign Countries, procured  
in the shortest time possible.

## ENGRAVINGS FINELY EXECUTED.

Our Patent Agency.

The PATENT AGENCY of the MINING and SCIENTIFIC PRESS  
has been signalized with remarkable success during the  
past two years. The importance to the inventive genius of  
this coast of a thorough and reliable agency for the solici-  
tation of LETTERS PATENT from the United States and foreign  
Governments cannot be over-rated, and the Proprietors of the  
Press, feeling the responsibility which rests upon them, and  
the reward which must follow the faithful performance of  
their trusts, will take care to afford inventors every advan-  
tage to be secured to them through a competent and re-  
sponsible agency upon this coast.

TO VICTIMS OF RHEUMATISM IN  
ALL ITS FORMS.

BE IT KNOWN TO ALL WHO ARE AFFLICTED WITH  
this terrible and excruciating disease, that the means  
of a safe, speedy and permanent cure are within the reach  
of every sufferer, by using

**RICHARDS' REMEDY!**  
For Inflammatory, Chronic, Hereditary and Mercurial  
Rheumatism, Rheumatic Gout, Lumbago, Sciatica, and all  
the modifications of the disease, whether confined to one  
portion of system or erratic in their character. Composed  
wholly of VEGETABLE EXTRACTS, it exterminates the  
complaint without injuring the constitution. None but the  
TORTURED SUFFERERS who have been relieved from  
their agony by the operation of this remedy, can realize the  
security which the mere cessation of long-continued tor-  
ment imparts. Sleep returns, strength returns, health and  
happier return to the pain-worn and debilitated patient, and  
once cured, nothing but the grossest imprudence can lead to  
a relapse. The confidence with which these statements  
are made to the public, is the result of many years' ob-  
servation and experience. The reputation of mere "palli-  
atives soon dies out, but that of a **STERLING MEDICINE**,  
which produces, year after year, in all cases, the same bene-  
ficial effects, NEVER DIES. This has been the history of  
Richards' Remedy. Try it!  
For Richards' Remedy is for sale by  
**H. BOWMAN, Druggist, Sacramento,**  
11v15 And by Druggists generally.

S. O. PCTNAM, Secretary.

OVER FIFTEEN THOUSAND MEMBERS!

### Pacific Mail Steamship Co's THROUGH LINE TO NEW YORK,

Carrying the United States Mail.

LEAVE FOLSOM STREET WHARF, AT 11  
o'clock A. M. of the following dates, for  
PANAMA, connecting via Panama Railroad, with one of  
the Company's splendid steamers from ASPINWALL for  
NEW YORK.

On the 10th, 18th and 30th of each month that has  
30 days.

On the 10th, 19th and 30th of each month that has  
31 days.

When the 10th, 19th and 30th fall on Sunday, they will  
leave on Saturday preceding; when the 18th falls on Sun-  
day, they will leave on Monday following.

Steamer leaving San Francisco on the 10th touches at  
Manzanillo. All touch at Acapulco.

Departures of 14th or 19th connect with French Trans-  
Atlantic Co.'s steamer for St. Nazaire, and English steamer  
for Southampton, and P. R. R. Co.'s steamer for Central  
America.

Departure of the 30th connects with English steamer for  
Lima, the port of the new mines.

The following steamships will be dispatched on dates as  
given below:

March 9th—SACRAMENTO..... Capt. J. M. Cavarly,  
Connecting with HENRY CHAUNCEY, Capt. Gray.  
March 19th—CONSTITUTION..... Capt. W. F. Lapidge,  
Connecting with OCEAN QUEEN, Capt. Maury.  
March 30th—GOLDEN AGE..... Capt. J. S. Watkins,  
Connecting with the RISING STAR, Capt. Furber.

Cabin passengers berthed through. Baggage checked  
through—100 pounds allowed each adult.  
An experienced Surgeon on board. Medicine and attend-  
ance free.

These steamers will positively sail at 11 o'clock. Passen-  
gers are requested to have their baggage on board before 10  
o'clock.  
Through Tickets for Liverpool by the Inman Line, can be  
obtained at office P. M. S. Co., San Francisco.  
For Merchandise and Freight apply to Messrs. WELLS,  
FARGO & CO.

The splendid steamship COLORADO will be dis-  
patched on WEDNESDAY, April 3, 1887, for Hongkong, via  
Kangawa, carrying passengers, mails and freight.  
For passage and all other information, apply at the Pacific  
Mail Steamship Co's office, corner of Sacramento and  
Leidesdorff streets.

Issued by the United States or Foreign Countries, procured  
in the shortest time possible.

**ENGRAVINGS FINELY EXECUTED.**  
Our Patent Agency.

The PATENT AGENCY of the MINING and SCIENTIFIC PRESS  
has been signalized with remarkable success during the  
past two years. The importance to the inventive genius of  
this coast of a thorough and reliable agency for the solicitation  
of LETTERS PATENT from the United States and foreign  
Governments cannot be over-rated, and the Proprietors of the  
Press, feeling the responsibility which rests upon them, and  
the reward which must follow the faithful performance of  
their trust, will take care to afford inventors every advan-  
tage to be secured to them through a competent and re-  
sponsible agency upon this coast.

### TO VICTIMS OF RHEUMATISM IN ALL ITS FORMS.

BE IT KNOWN TO ALL WHO ARE AFFLICTED WITH  
this terrible and excruciating disease, that the means  
of a sure, speedy and permanent cure are within the reach  
of every sufferer, by using

**RICHARDS' REMEDY!**  
For Inflammatory, Chronic, Hereditary and Mercurial  
Rheumatism, Rheumatic Gout, Lumbago, Sciatica, and all  
the modifications of the disease, whether confined to one  
portion of system or erratic in their character. Composed  
wholly of VEGETABLE EXTRACTS, it exterminates the  
complaint without injuring the constitution. None but the  
TORTURED SUFFERERS who have been relieved from their  
torment by the operation of this remedy, can realize the  
ecstasy which the mere cessation of long-continued tor-  
ment imparts. Sleep returns, strength returns, health and  
happiness return to the pain-worn and debilitated patient, and  
once cured, nothing but the grossest imprudence can lead  
to a relapse. The confidence with which these statements  
are made to the public, is the result of many years' ob-  
servation and experience. The reputation of mere pallia-  
tives soon dies out, but that of a STERLING MEDICINE,  
which produces, year after year, in all cases, those benefi-  
cial effects, NEVER DIES. This has been the history of  
Richards' Remedy. Try it!  
Richards' Remedy is for sale by  
**H. BOWMAN,** Druggist, Sacramento,  
And by Druggists generally.

## New Mining Advertisements.

## Enalla Mining Company, State of Guerrero, Mexico.

Notice.—There are delinquent upon the following described stock, on account of assessment levied on the 20th day of February, 1897, the several amounts set opposite the names of the respective shareholders as follows:

Names.	No. Certificate.	No. Shares.	Amount.
Wm. Buehn.....	bal 263	50	\$25 00

And in accordance with law, and an order of the Board of Trustees, made on the twelfth day of February, 1897, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the salesrooms of Maurice Dore & Co., No. 327 Montgomery street, San Francisco, Cal., on Monday, the eighth day of April, 1897, at the hour of 12 o'clock, M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

MAX BURCKHARDT, Secretary.  
Office, Room No. 1, Crim House, No. 83 Kearny street, San Francisco, Cal. m23

## Gold Quarry Company, Location of Works: Placer County, State of California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-first day of March, 1897, an assessment of twenty dollars (\$20) per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary, (room No. 4) No. 706 Montgomery street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the twenty-second day of April, 1897, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the thirtieth day of May, 1897, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

T. W. COLBURN, Secretary.  
Office, Room No. 4, 706 Montgomery street, San Francisco, Cal. m23

## Mount Tenabo Silver Mining Company.—Location of Works: Cortez District, Lander County, State of Nevada.

Notice.—There are delinquent upon the following described stock, on account of assessment levied on the fifteenth day of February, 1897, the several amounts set opposite the names of the respective shareholders as follows:

Names.	No. Certificate.	No. Shares.	Amount.
Gordon, John.....	48	75	\$112 50
Gillespie, Henry.....	19	87	55 50
Gallagher, James.....	50	100	150 00
Hearst, George.....	54	216	414 00
Lehmann, Christian.....	24	6	9 00
Macpherson, A. W.....	26	239	449 50
Vandervoort, J. C.....	23	50	75 00

And in accordance with law, and an order of the Board of Trustees, made on the fifteenth day of February, 1897, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the salesrooms of Maurice Dore & Co., No. 327 Montgomery street, San Francisco, Cal., on Thursday, the eleventh day of April, 1897, at the hour of 12 o'clock, M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

R. N. VAN BRUNT, Secretary.  
Office, 331 Montgomery street, San Francisco, Cal. m23

## Nuestra Señora de Guadalupe Silver Mining Company. Location of Works: Tayoltita, San Dimas District, Durango, Mexico.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the fifteenth day of March, 1897, an assessment, No. 26, of one dollar (\$1) per share was levied upon the assessable capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary, E. J. PFEIFFER, at the office, No. 210 Post street, or to the Treasurer, A. H. KENNEDY, at his office, No. 637 Washington street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the seventeenth day of April, 1897, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Wednesday, the fifth day of May, 1897, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

R. J. PFEIFFER, Secretary.  
Office, No. 210 Post street, San Francisco, Cal. m23

## Rattlesnake Gold and Silver Mining Company, Brown's Valley, Yuba County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-second day of March, 1897, an assessment of one dollar (\$1) per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary, 318 California street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the twenty-fifth day of April, 1897, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the thirtieth day of May, 1897, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

JOHN F. LOISE, Secretary.  
Office, 318 California street, San Francisco, Cal. m23

## Salamanca Gold and Silver Mining Company. Location of Works: Leon's Ranch District, Calaveras County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment levied on the eleventh day of February, 1897, the several amounts set opposite the names of the respective shareholders, as follows:

And in accordance with law, and an order of the Board of Trustees, made on the eleventh day of February, 1897, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the salesrooms of Balcer & Chapman, No. 312 Montgomery street, San Francisco, Cal., on Wednesday, the tenth day of April, 1897, at the hour of 1 o'clock, P. M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

## Machinery.

# STEWART'S CELEBRATED HINGED Grinder and Amalgamator.

## Is the Cheapest and Quickest Pan

Now used. It is flat-bottomed, loses far less power in throwing the pulp, and circulates the same under the miller to better advantage than any other Pan in use, while the steam, owing to the thinness of the cone, has a more direct effect in heating the pulp. It is the miller plate, P the Grinding Shoe, attached by an adjustable hinge joint in the middle of the same—the bottom wearing down even with the dies.

Mr. J. H. STEWART, the inventor, has had ten years of experience in mechanical operations, and may be addressed at San Francisco, or called on at the Miners' Foundry, First street, where his Pan is manufactured, and is to be seen at any time in operation. 25v11

## HUNTER'S IMPROVED CONCENTRATOR.

THE INVENTOR OF THE ABOVE RECENTLY IMPROVED Machine, is now prepared to take contracts for concentrating gold or silver ores on shares, receiving a certain per cent. of the sulphurets as may be agreed upon; and will guarantee twenty per cent. more sulphurets than from any rocker or concentrator built on the Pacific coast, saving at least ninety per cent. of the sulphurets contained in the ore. The sulphurets, if desired for shipping, will contain less than one per cent. of sand.

Persons who have sulphureted ores will do well to have their sulphurets saved; as the many failures in mining can often be attributed to the waste of sulphurets. For particulars, address

One of these Machines can be seen in operation at the Union Foundry, in this city, up stairs.

ANDREW HUNTER, Inventor, 22v13-3m San Francisco.

## VARNEY'S PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the miller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery by the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setters made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the **PACIFIC FOUNDRY,** San Francisco. 1v1

## Steam Pumps,

FOR ORAINING MINES OR ELEVATING WATER TO ANY HEIGHT.

## PICKERING'S GOVERNORS

For Steam Engines.

## Giffard's Injectors,

For Feeding Boilers.

## STODDART'S IRON WORKS,

Beale Street, San Francisco. 23v12 3m

## BRUCKNER'S Mechanical Roasting Furnace

AWARDED A

PREMIUM SILVER MEDAL

—BY THE—

The Mechanics' Institute.

Patented December, 1886.

THESE FURNACES ARE NOW MANUFACTURED AFTER AN IMPROVED mode of construction, which GREATLY SIMPLIFIES THEIR OPERATION, and afford a much larger oxidizing surface to the action of heat and atmosphere.

The weight of a Furnace nine feet long by four feet in diameter does not exceed one ton.

## THE IMPROVED FURNACE

May be seen in operation, for desulphurizing or roasting and chloridizing, at Central Mill, Virginia City, Nevada.

Parties wishing to erect such Furnaces, are requested to leave their orders with

T. KALLENBERG,

19v12 416 Market street, San Francisco.

## Brodie's Patented Improvements

FOR THE TREATMENT OF

## Gold and Silver Ores.

**BRODIE'S PATENTED IMPROVED QUARTZ CRUSHER.**  
The attention of all interested in Mining is respectfully called to this improved Machine for Breaking or Spalling Quartz, or other Rock, possessing, as it does, simplicity of action and lightness of construction, so far as is compatible with strength and durability. In consequence of these advantages, the advertisers are enabled to offer these machines to the public at the following low terms:  
No. 1.—Or 6-inch Crusher, capable of reducing from three to four tons of quartz per hour, no piece being larger than a walnut—price.....\$600  
No. 2.—Or 15-inch Crusher, capable of similarly putting through five to six tons per hour.....\$850  
No. 3.—Or 18-inch Crusher, will in a similar manner crush from seven to eight tons per hour.....1,200

EXPLANATION OF THE ABOVE ENGRAVING.

The frame is made of cast iron, bound with heavy wrought iron bands, making it very strong, and at the same time light and portable. The crusher is bolted to a wood frame of sufficient height to clear the fly-wheel, and allow the crushed quartz to pass off. The dotted lines show the movable and stationary jaws. Letter A represents the eccentric shaft by which the power is applied direct to the movable jaw. B represents the movable jaw, and C the fixed jaw. D represents the link or radius bar. E represents the bolts for regulating the opening of the jaw, which can be regulated at pleasure, so as to graduate the size to which it is intended the quartz shall be crushed. G represents the feed opening, by which the size of the machine is designated.

The arrow on the fly-wheel shows the direction to drive the eccentric, which, in combination with the link, D, gives the movable jaw, B, a forward and downward motion at the same time, and which makes the hardest rock yield and separate into fragments of any desired size.

The above Crushers have been recently erected and are now successfully employed at Bear Valley, Mariposa county, Rawhide Ranch, Tuolumne county, Excelsior Mine, Lake District, Nevada county, and can be seen in operation at the Fulton Foundry, First street, San Francisco.

The following testimonial respecting the effectiveness of this Crusher, has been received from the Superintendent of the "Rawhide Ranch" Mine, in Tuolumne county:

RAWHIDE RANCH, Tuolumne Co., Sept. 28, 1886.  
JAMES BRODIE, Esq., San Francisco.—My Dear Sir: It gives me pleasure to inform you that I have for the past three months had one of your largest sized Rock Crushers in use at the Rawhide Ranch Mining Company's Mill, which has entirely met my expectations, and I have no hesitation in recommending it to all who are in need of a machine for rapidly, cheaply and properly preparing quartz for the stamps. Yours truly, Supt. Rawhide Ranch Quartz Mill. R. P. JOHNSON.

**BRODIE'S PATENT IMPROVED GERMAN AMALGAMATING BARREL.**—This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, 1884. Further particulars will be afforded on application to the subscribers.

Those infringing the patent rights to the above improved Barrel, are hereby informed that after the 1st of November, 1886, the royalty charged for using the same will be raised to the sum of \$100 per Barrel. A diagram, with explanations of this machine, will be found in the Mining and Scientific Press, of September 29th, 1886.

**BRODIE'S PATENT WINDMILL SEPARATOR FOR ORE CRUSHING.**—This Dry Crusher has been found the most economical and effective mode of crushing ores in Mexico, California and Nevada. Diagrams and explanations afforded on application to the subscribers.

A drawing and full description of this machine will be found in the Mining and Scientific Press of Sept. 29th, 1886. **BRODIE & RADCLIFFE,** Express Building, 402 Montgomery street, San Francisco. 12v13d

## Foundry for Sale.

A One-half Interest in the

## UNION IRON WORKS,

SACRAMENTO,

Owned by William B. Williams, is offered for sale on the most favorable terms.

## A Good Bargain

May be had, as the proprietor is going home to Europe. It is seldom that so good an opportunity is offered for a sure and permanent investment. The business of the establishment is exceedingly flourishing, as can be shown. The Shop is of brick, new and well built. The lot is 35 feet front by 163 feet in depth, in a good location for this business, on Front street, between N and O streets.

Inquire at the office of the Foundry, or address **WILLIAM B. WILLIAMS,** Sacramento, Cal. 25v13d19-19p

## Notice to Miners, Well-Borers and Water Companies.

**M. PRAG** IS NOW PREPARED TO MANUFACTURE Hydraulic and Artesian Well Pipes in the best workmanlike manner, and at the lowest market rates. Having made large additions to my stock of machinery for that branch of business, I am prepared to fill all orders with dispatch, and guarantee entire satisfaction. I also manufacture Mississippi Stoves, of the latest improved patterns, for vessels of all classes. Also, Ship Plumbing done.

M. PRAG, 8v13-1y Stove Store, No. 125 Clay street, below Davis.

## BLAKE'S QUARTZ BREAKER! PRICES REDUCED!

MACHINES OF ALL SIZES FOR SALE

—BY—

WM. F. BLAKE,

Corner First and Mission streets, or Box 2,077 3v13f SAN FRANCISCO.

## Brown's Filtering Heater!

FOR PREVENTING INCrustation IN STEAM BOILERS, purifies water from lime or any other impurity, saves fuel, saves the boiler, prevents explosions, and protects life and property. The cost of the Filter is soon saved in fuel and boiler-repairs alone.

One is in operation at the San Francisco Foundry, Fremont street, where Rights can be procured, or all needed information, on application, in person or by letter, to **AUSTIN A. WELLS,** Agent. 5v14-1y

## LEFFEL'S American Double Turbine

THESE WHEELS, UNEQUALLED AND UNRIVALLED IN THE United States or the world, have been fully tested on this coast, more than forty being in use at this date in California and Oregon, driving all kinds of machinery, Saw Mills, Flour Mills, Quartz Mills, etc., etc., etc.

CALIFORNIA REFERENCES.—E. Stockton, Folsom; O. Simmons, Oakland, (Mill at Clear Lake); Morgan Coville, Lexington, Santa Clara County; J. Y. McMillan, Lexington, Santa Clara County. Send for Circular to **KNAPP & GRANT,** Agents for California. 26v13-1yq 310 Washington street, San Francisco

## To Quartz Miners and Others.

### NOTICE!

I WISH TO CALL YOUR ATTENTION TO A PULVERIZER of my own invention, which I have called the

### HITCHENS' ORE PULVERIZER.

It is now in operation at the South Park Saw Mill, on Brannan street, between Third and Fourth streets. I am prepared to reduce, to an impalpable powder, quartz, sulphurets, tailings, cement, manganese, charcoal, sands, marble, plumbago, copper ores, etc.

In view of the importance of reducing ores, etc., to an impalpable powder, and being satisfied my invention to be a perfect success, I invite all interested in the subject to examine it. Patent applied for. 1v14-3m JAMES HITCHENS.

## STRONG & CO'S CELEBRATED UNION PAN!

A fast Grinder and thorough Amalgamator, has double

Millmen and others are respectfully invited to examine this Pan, before purchasing others, as it gives the best satisfaction. Can be seen in operation, daily, at the San Francisco Foundry, Fremont street, near Mission. Ores, in lots not exceeding 2,000 pounds, tested by 22v13 G. W. STRONG, Assayer.

## STEAM HOISTING APPARATUS.

## FOR SALE!

**PATENT RIGHT OF HUNT'S WINDMILL** for the State of California or the whole Pacific coast.

This Mill is superior to any other, can be built cheaper, and is more durable.

Full sets of patterns for four sizes Self-Regulating Mills, and three sizes of Adjustable Mills, will be sold with the right.

This Windmill has been extensively advertised all over this coast, and is favorably known. Apply to

**E. O. HUNT,**

28 SECOND STREET,

11v24 San Francisco.

## Nitro-Glycerin!

WE ARE INFORMED THAT CERTAIN PERSONS ARE offering to use the famous and well known Nitro-Glycerin, used for Explosions in Oil Wells, Blasting or other purposes.

This is to notify the public that the United States Blasting Oil Company is the sole owner of the Nobel Patents for manufacturing Nitro Glycerin, and for exploding the same; and that any and all infringements of the Company's rights will be prosecuted in law.

The Company is now prepared to supply any desired quantity of the best quality of Nitro-Glycerin to the public with instructions how to use it and avoid accidents. Orders to be addressed to **JAMES OBEVAU,** Secretary, 32 Pine street, New York.

**T. P. SHAFNER,**

President U. S. Blasting Oil Company, 32 Pine street, New York. 11v14-1m

## Pratt's Abolition Oil.

FOR ABOLISHING PAIN—THE BEST REMEDY IN existence for Rheumatism, Neuralgia, Paralysis, Headache, Toothache, Sore Throat, Ophthalmia, Warts, Swollen and Stiff Joints, Contracted Cords and Muscles, Cramps, Colic, Diarrhoea, Cholera, Pains in the Breast, Laue Back, and all aches and pains. It is the poor man's friend, and the best family physician. Full directions accompany each bottle. Price 50 cents and \$1 per bottle. For sale by all dealers in medicines. Sole Proprietors, A. McBOYLE & CO., Druggists and Chemists, 234 Sacramento street, opposite What Cheer House, San Francisco. 10v14-1y

A SINGULAR CASE.—The following is from a Milwaukee, Wis., journal, of Jan. 29th: 'Several months since a number of young men, belonging to the city, were in a saloon, drinking. They were evidently feeling very well from the excitement of stimulants, and were exhibiting feats of gymnastics, when one of them, a young German named Wilder, declared that he had strength sufficient in his fist to knock through one of the stout panels of the door. Before his comrades could interfere, Wilder struck the door, forcing the panel completely. The blow bruised his knuckles considerably, but not so seriously as it was thought, breaking the flesh and making them bleed. The hand was also bled. Nothing was thought of the matter at the time, the hand was done up and the party separated. The numbness in Wilder's hand continued to increase. He experienced no pain, but a dead feeling, as if the hand had gone to sleep, as he expressed it. In a few weeks the hand began to wither and the fingers to shrink up, and now they present a curious appearance. The hand is wholly useless, and of a dead looking gray color, as if no blood circulated in it, and has shrunk to nearly one-half the size of the other hand. The nails are black, but still retain their hold upon the flesh. They have not grown any since the blow was given. Upon cutting the hand, a little blood will stand in the wound, but it does not bleed like a fresh cut. There is no sign of mortification in the hand. The dead feeling reaches only a few inches up the arm. Wilder has no power over the hand, and cannot close it. The bones of the fingers seem to have shrunk with the flesh, and to have softened to a substance resembling gristle. Several surgeons have examined the hand and declare that they never saw nor heard of a case similar to this. The hand and arm are watched carefully, and if signs of the numbness are discovered spreading, as they are now, amputation will be performed.'

**MINING SUIT.**—Samuel Adams has brought suit in the Twelfth District Court against his partners in the Delphi claim, Kern county. He charges that on December 12th, 1865, defendants Maraschi and McKeadney took possession of the mines and worked them so unskillfully as to cause a loss to the company of \$20,000; that the value of the whole mine is \$80,000; that since November 23d, 1864, 1,129 tons of rock have been taken out, valued at \$85 per ton; that not only false returns have been made from the proceeds, but that defendants have willfully permitted much gold to remain in the tailings, that they might wash them over again for their own benefit. According to the complaint, the mining and crushing expenses ought not to exceed \$15 per ton. The defendants' total yield is put down at only \$5,535, when, as complaint alleges, the mine has yielded \$50,000. Plaintiff prays for a partition and division by referee, that the property be sold, account taken, defendants restrained, receiver appointed, etc.

**LIMITED BUT GOOD.**—Two strangers, supposed to be from the east and believed to be "capitalists," as well from their manners as from the fine quality of their "store clothes," strolled over Lander Hill examining various mining operations. Coming to a certain mine, where there was but one man at work, they stopped for a moment to observe the superior character of the preparations for extensive mining. A spacious and clean face had been cut on the hillside, which afforded a platform of generous dimensions at the mouth of the tunnel, which had been commenced and driven in a few feet. The handsome job seemed to be the result of a combination of capital and skill. They asked the solitary workman—who, by the way, is of small size, but of good stuff—the name of the company and its capital stock. Resting on his pick, the plucky little fellow replied: "I am the company, gentleman; and my capital stock is a couple of sacks of flour, a side of bacon, a strong will, good health and a quiet conscience."—Reese River Reville, March 2d.

**TAXIDERM.**—Immense numbers of deceased poodles are stuffed every year in New York, in the highest style of the art, for their bereaved mistresses, by those who make taxidermy a profession. The price is fifteen dollars.

**DON'T PAY.**—The expense of working the copper mines near Santiago de Cuba, including cost of transportation of the ore, no longer admits of profitable competition with other mines. They will therefore be abandoned.

**THE USE OF INSECTS.**—Darwin says that flowers have become through natural selection conspicuous in contrast with the greenness of the leaves, that they might be easily observed and visited by insects, so that their fertilization might be favored. I have come to this conclusion from finding an invariably rule that when a flower is fertilized by the wind it never has a gaily colored corolla. Again, several plants habitually produce two kinds of flowers; one kind opened and colored so as to attract insects; the other closed and not colored, destitute of nectar, and never visited by insects. We may safely conclude that, if insects had never existed on the face of the earth, the vegetation would not have been decked with beautiful flowers, but would have produced only such poor flowers as are now borne by our firs, oaks, nut and ash trees, by the grasses, by spinach, docks and nettles.

**ANOTHER AVALANCHE** has occurred on the Donner Lake road, near the Summit. Thirteen men were buried, of whom ten were recovered alive.

### Perry Davis' Vegetable Pain Killer.

The Great Family Medicine of the Age! Pain Killer, taken internally, should be adulterated with milk and water, and sweetened with sugar if desired, or made into a syrup with molasses. For a Cough, a few drops on sugar eaten will be more effective than anything else. For Sore Throat, gargle the throat with a mixture of Pain Killer and water, and relief is immediate and the cure positive. It should not be forgotten that the Pain Killer is equally as good to take internally, as to use externally. Each bottle is wrapped with full directions for its use. Please read the printed directions.

Sold by all Medicine Dealers everywhere. 9v14-1m

### Allen's Lung Balsam

Is warranted to break up the most troublesome Cough in an incredibly short time. There is no remedy that can show more evidence of its merits, than this Balsam, for curing Consumption, Coughs, Colds, Asthma, Croup, etc. To Physicians—Physicians having consumptive patients and having failed to cure them by their own prescriptions if they desire to try Allen's Lung Balsam, by writing to the proprietors they will send a formula which will enable them to judge whether the ingredients are of a superior compound or not. The medicinal properties are extracted by a chemical process. The apparatus by which some of them are extracted cost many thousands of dollars. Dr. H. P. Mackinnon, Dentist, Office No. 131 West Sixth Street, Cincinnati, states as follows: Gents—About one year ago I took a cold which settled on my lungs. A violent cough was the consequence, which increased with severity. I expectorated large quantities of phlegm and matter. During the last winter I became so much reduced that I was confined to my bed. The sickness was attended with cold chills and night sweats. A diarrhoea set in. My friends thought I was in the last stages of consumption, and could not possibly get well. I was recommended to try ALLEN'S LUNG BALSAM. The formula was shown to me, which induced me to give it a trial, and I will only add that my cough is entirely cured, and I am now able to attend to my business as usual. P. MEREDITH.

Sold by all Medicine Dealers everywhere. 9v14-1m

## Gaston's Screw Grinder and Amalgamator

The Best Yet Invented.

For rapidity and thoroughness of work, the machine above illustrated is unequalled by any. It wastes no appreciable quantity of quicksilver, and is of itself a perfect settler. Fig. 1 represents the pan with part of its side removed, and Fig. 2 the screw muller, and its shoes. The letters c show the threads of the screw; H, its shoes, and D a low cylinder within which the screw rotates; E, represents open spaces through the base of the cylinder, and F, inclined partitions filling (at those points) the spaces between the cylinder and the shell of the pan. These inclined partitions are to intercept the current of pulp around the pan, as it issues from under the muller, and turn it toward the center again, over the screw. The dies are not shown in the figure—there are eight. Mercury is not ground, nor floured in this pan. The pulp is ground to a slum, with great rapidity; the muller is raised a little and the quicksilver is poured in *en masse*, forming a layer upon the bottom of the pan. The revolution of the screw then forces the pulp down into contact with the quicksilver, into which it is *effectually rubbed* by the shoes, while the screw, being constantly fed by the pulp from above it, presses all under the muller outward—still in contact with the quicksilver, through the spaces, E, and thence over toward the center of the pan, when it is again seized by the screw and forced down into the quicksilver, rubbed into and forced off in contact with it, which process is continued as long as desired. The pulp can thus be forced into contact with the mercury at the rate of 1,000 pounds in three minutes, or twenty times per hour, and none can escape contact with the mercury, that contact being under the immenso pressure of the perpetual screw, in addition to that of gravity, which (gravity) is the only available force in the other pans for bringing the pulp into contact with the quicksilver. "A word to the wise is sufficient." The Screw Amalgamator is the cheapest and most efficient pan manufactured. Millmen! call and see one running at the Pacific Foundry. For particulars, address the inventor, H. A. GASTON, at Cosmopolitan Hotel, San Francisco; or R. L. THOMAS, Esq., Virginia City, Nevada. 1v14-1qr

## Portable Steam Engines!

"Hoadley's" and "Hittinger's" Make.

HOADLEY'S.

FOUR SIZES,

8, 10, 12, and 15-Horse Power,

HOADLEY'S.

3 to 40-Horse Power.

HITTINGER'S.

THREE SIZES,

5, 7, and 10-Horse Power

HITTINGER'S.

TWO SIZES,

5 and 7-Horse Power,

COMBINING THE MAXIMUM OF EFFICIENCY, DURABILITY, and Economy, with the Minimum of weight and price.

These Engines are favorably known, a large number being in use on this coast for hoisting, pumping, threshing, milling and mining purposes. Steam can be got up on these Engines in fifteen minutes after reaching the place of operation, and the time, expense of setting boilers, machinery, and "construction account" saved, (which is often the difference between the successful and unsuccessful prosecution of mining enterprises,) in fact, the portable principle is the pioneer's friend, and enables him to draw engines on their own wheels, to his cabin door, and plant on the outermost confines of civilization the saw and grist mill, and it has done and will do more to help subdue the continent than any other of the modern motors which are crowding society and normalizing the world. All sizes on hand from 3 to 30 horse power, with and without carriages. Also, Portable Saw and Grist Mills. For sale by TREADWELL & CO., Corner of Front Market and streets. 9v14-6m15p

**OLYMPIC CLUB EXHIBITION.**—This took place on the evening of the 15th inst. The elite of San Francisco were present. Many very remarkable feats of agility and of strength were performed. Some of them were as extraordinary as any efforts of the Japanese acrobats, which elicited such applause a few weeks since. Among them, is especially to be mentioned that of Mr. G. H. Strong, who balanced a 30-foot ladder upon his upturned feet, while a boy of six or seven years climbed it, and indulged in various gyrations at the top; also that of Mr. W. S. Lawton, whose brilliant performance upon the swinging perche was universally admired. Tumbling, sparring, the club exercise, the horizontal bar perche, and the trapéze, formed part of the evening's entertainment. All agree in pronouncing the feats executed as fully equal to those of professional athletes. Yet these were done by men who are occupied throughout the greater part of every day with their duties as clerks, merchants, artists and mechanics; who have connected themselves with the club, partly from the love of such athletic exercises, and partly for the sake of the physical benefit to be derived from them.

Physical training is beginning to be recognized as an important branch of education. This is as it should be. Unquestionably it is, in reality, as essential to the completion of the perfect man, as intellectual or moral training. "*Mens sana in sano corpore.*" There can be no perfect mental health, unless in connection with perfect bodily health. The emotional, the intellectual, and the physical man, are so intimately associated together—so intertwined, as it were—that any derangement of either, involves a disturbance of the whole human economy. Perfect health consists in perfect harmony between these. Each, then, should be regularly and appropriately exercised.

We hardly know to what perfection the muscular system can be brought. Of course only those who devote their attention solely to this sort of training, can become perfect as acrobats. Life is too short to allow any man to attain perfection in everything. We shall never see a Daniel Webster with the strength of a Winship, the suppleness of D'Evani, and the agility of a Blondin. Yet, by means of proper exercise, judiciously varied, almost any man can preserve that equilibrium between the intellectual, emotional and physical portions of his nature, upon which true health and enjoyment of life depends.

**A NEW BOOK.**—A Roman & Co., of this city, have in press a work by Professor Laynes on the elements of composition, belles-lettres and oratory. The work has been submitted to the examination of the State and County Superintendents of Schools, and to the criticism of several legal and literary gentlemen of this city. All speak of it in the highest terms. It is being printed at the office of the MINING AND SCIENTIFIC PRESS.

**THE PEERLESS GAS BURNER** is the latest invention in that line which we have noticed. The design, which is ornamental as well as useful, consists in arranging three or more gas burners around one of the ordinary silver lined glass globes. The effect is not only beautiful, but the reflection adds greatly to the amount of light thrown out into the room. It is an Eastern invention, and is being introduced into this city by G. D. Hager, No. 559 Market street. One of the burners may be seen at this office.

**COAL.**—We have been shown some mineral coal found on the ranch of Mr. Moody, situated about ten miles west of this city, in the Buttes, near the Colusa road. It is the genuine article, and for California coal, is of a superior quality. An assay made by Mr. F. W. H. Aaron, gave only seven per cent. ash.—*Marysville Appeal, March 20th.*

**MANGANESE.**—The ship Reindeer, now loading for Liverpool, carries thirty-five tons of manganese from Red Rock.

### City Amusements.

**METROPOLITAN.**—Mr. Heller's third week has brought new tricks, which are nightly witnessed by crowds of delighted spectators. "Cabalistic cookery" is finely performed; also, the "Crystal casket" and "with an orange." The second part gives new proofs of Heller's skill as a pianist, and his description of the man who went to hear "Faust" should be heard to be appreciated. The wonderful Wood Minstrels complete the evening's entertainment.

**OPERA HOUSE.**—On Monday and Tuesday nights "A Bird in the Hand is worth Two in the Bush," was performed, followed by Harry Jackson's clever imitations of Heller—some of which are quite good. Sinclair, as Willie, has a remarkable resemblance to the original. A good audience was present on Wednesday night, that being the occasion of the debut of Miss Pauline Conger. "The Wife" being the piece selected, she was well received, and did very creditably. On Thursday night "The Long Strike" was played.

**PLATT'S HALL.**—An entertainment will be given here on Saturday evening, consisting of songs, dances and acrobatic performances.

### Mineral Land Law Blanks FOR SALE.

We are prepared to furnish any of the following blanks used in securing patents for lands under the National Mineral Land Act of 1866:

- I. Applicants' Declaratory Statement.
- II. Diagram, Description of Diagram and Boundaries, and Notice.
- III. Register's Order for Publication—with Notice.
- IV. Deposition that Notice has been Posted.
- V. Application for Survey Etc.

PRICES.—Single blanks, 10 cents; 75 cts per dozen; \$4 per hundred—postage paid.

Pamphlet containing the Law and the Instructions of the General Land Commissioner, post paid, 25 cts. Address DEWEY & CO., Mining and Scientific Press, San Francisco.

### New Mining Laws of California and Nevada.

We have just issued, in cheap edition, the new laws relating to mining and corporations in California and Nevada, passed in 1865-6. Some of these laws are of the highest importance to parties interested in the matter of locating and holding claims, and prospecting mines, in these States. Copies sent by mail. Price, 25 cents.

Address, DEWEY & CO., Patent Agents.

San Francisco, May 1st, 1866.

### Subscribe at Once!

From the commencement of Volume XIV of the MINING AND SCIENTIFIC PRESS, only a limited number of copies will be saved for files by us; consequently those who desire the paper its for future as well as present value, should subscribe at once.

### PATENT BUSINESS.

We have lately associated with us in the Patent and Mechanical Department of the Mining and Scientific Press, a gentleman of superior ability and attainments, who has arrived direct from the leading patent agency in New York City, and having a faithful and reliable associate in Washington City, we are now better than ever before prepared to secure the claims of our applicants, in a careful, prompt and efficient manner. DEWEY & CO., Patent Solicitors. San Francisco, Jan. 1867.

**Our Circulation.**—THE MINING AND SCIENTIFIC PRESS has a large and permanent subscription list, and enjoys a more universal circulation among stockholders and persons directly interested in mining than any other paper on the coast.

**J. A. BAUER,**  
**Chemical Laboratory,**  
AND DRUG STORE,  
644 Washington Street. [Established 1849.]  
SAN FRANCISCO.  
Careful Analyses made of  
Ores, Minerals, Waters, Oils, Liquors,  
Wines, Products of Art, etc.

**Pharmaceutical Preparations Made to Order.**  
Opinions given on Chemical Questions and Oology.

Particular attention paid to Analyses of all kinds, in cases where legal questions are involved.

Nitrate of Silver, Gold Chloride, Platin Chloride, Sodium Amalgam, Sulphate of Copper, etc., for sale.  
12v14-6m

**ITALIAN MANUFACTORY**  
OF  
**MACCARONI, VERMICELLI,**  
PASTE & FARINA.  
(706 Sansome St. 706)  
SAN FRANCISCO.  
**BRIGNARDELLO, MACCHIAVELLO & CO.**  
12v14-6m

### Copartnership Notice.

THE UNDERSIGNED HAVE FORMED A COPARTNERSHIP, under the firm name of D. A. MACDONALD & CO., for the purpose of carrying on the business of Sawing and Planing, and the manufacture of Doors, Sashes, Blinds, Moldings and House Finish of every description, at the corner of Market and Beale streets, where we will be happy to receive a call from our old patrons.  
D. A. MACDONALD, J. H. MACDONALD,  
JOS. MCGILL, HOWARD CHAPMAN.  
San Francisco, Feb. 1, 1867. 12v13-3m

**Pacific File, Reaper and Mower Section MANUFACTORY,**  
No. 58 Beale Street, between Market and Mission, SAN FRANCISCO.

Files Recut and warranted as good as new, or no charge. The only establishment in the State. We also manufacture Reaper and Mower Sections.  
S. BENSON & CO., Prop'rs.  
12v14-3m

### Pacific Business College

—AND—

### Telegraph Institute,

(MECHANICS' INSTITUTE.)

Post street, between Montgomery and Kearny.

THIS INSTITUTION is designed to prepare Boys and Men for

**Business Pursuits,**

And to impart a thorough

**Commercial Education.**

It is conducted upon actual business principles. The student, upon entering the College is furnished with a

**Capital in Cash and Merchandise,**

Rents a place of business, opens an account with the bank, insures his goods with the Insurance office of the College, and enters upon the arena of business. He

**Commences Speculation,**

Carrying out all the details of trade—buying and selling goods, depositing in and checking from the bank, making and negotiating notes, drafts, bills of exchange, etc., recording the transactions and keeping the books in a regular and scientific manner. From this he advances to other capacities, until he finally takes his position in the

**Union Business College Bank,**

A regularly established institution, complete in all its appointments, and having a circulation of

**One Million in College Currency,**

This course saves from four to six weeks' time in copying useless manuscripts.

**Penmanship.**

PROF. F. SEREGNI, our Instructor in Penmanship, is well known to be a thorough and systematic teacher. And no College at present on this coast advertising to teach Penmanship, has ever taught the same by a regular, systematic plan, and we unhesitatingly declare, that for practical and systematic instruction in this branch, we challenge competition.

**Telegraphing.**

The large and increasing demand for good Telegraph Operators has induced us to organize a separate department or thorough instructions in this branch, and we are now enabled to present advantages in this line equal to any that can be afforded on the continent. Several instruments are in operation, and others will be added as occasion requires. So great is the demand for operators, that no young man, well qualified, need be wanting a situation. A skillful and accomplished operator has charge of the departments, and will devote his special attention to the advancement of the students under his charge.

There is no vacation, and students can enter upon any business day during the year. The public are invited to call and examine the various departments. Sessions day and evening.

For Circulars and further information, address  
JAMES VINSON HALE, President.

**W. T. GARRATT,**  
City  
**BRASS AND BELL FOUNDER**  
Cor. Mission and Fremont sts.,  
SAN FRANCISCO.  
Manufacturer of Brass, Zinc, and Anti-Friction or Babbett Metal Castings;  
CHURCH and STEAMBOAT BELLS,  
TAVERN and BAND BELLS AND GONGS,  
FIRE ENGINES, FORCE AND LIFT PUMPS,  
Steam, Liquor, Soda Oil, Water and Flange Cocks, and Valves of all descriptions, made and repaired. Hose and all other joints, Spelter, Solder, and Copper Rivets, &c. Gauge Cocks, Cylinder Cocks, Oil Globes, Steam Whistles,  
**HYDRAULIC PIPES AND NOZZELS**  
For Mining purposes, Iron Steam Pipe furnished with Flanges, &c. Coupling joints of all sizes. Particular attention paid to Distillery Work. Manufacturer of "Garratt's Patent Improved Journal Metal."  
Highest Market price paid for OLD BELLS, COPPER AND BRASS. 6v14

### Golden City Chemical Works.

**LABORATORY,**  
Corner of Seventh and Townsend Streets.  
**OFFICE,**  
Corner of Montgomery and Bush Streets.  
**CAPITAL STOCK, - - - \$500,000**

**Trustees:**  
H. P. WAKELEE, THOS. H. SELBY,  
NICHOLAS LUNINO, THOS. BELL,  
CHAS. E. McLANE.

**H. P. WAKELEE, MANAGER.**

THIS COMPANY ARE NOW PREPARED TO FURNISH Sulphuric, Nitric and Muriatic Acids of superior quality, in quantities to suit.

Orders will be received at the office only for Chemicals of every description, which will be manufactured as may be required. The Company beg to say that they have the advantages of all improved machinery and apparatus for the manufacture and manipulation of these products, and our Laboratory is fitted up with the most recent improvements which experience and science suggest, and is surpassed by none in completeness and perfection for the purposes it is designed. 6v14-3m

### Endorsement by the Miners' State Convention

The following resolution was adopted by the California Miners' State Convention, held at Sacramento, Jan. 17th, 1866:

Resolved, That we regard a mining paper or journal of great importance to the mining interest of California, and we recommend the Mining and Scientific Press, of San Francisco, to the consideration and support of the miners of the Pacific coast.

**Important to Californians.**—Many inventors have lately had their claims for Patents seriously (and in some cases fatally) delayed by the unqualification of agents who have not complied with the Government license and revenue laws, as well as other new and imperative regulations. These discrepancies, although arising from the inexperience of honest agents, are none the less dangerous to applicants for patents, whose safest course is to trust their business with none but active and experienced solicitors. THE MINING AND SCIENTIFIC PRESS PATENT AGENCY has strictly complied with the regulations of the Department, and properly filed all necessary papers as Claim Agents.

# MINING AND SCIENTIFIC PRESS.

Terms: One Year, \$5; Six Months, \$3.

Single Copies, Fifteen Cents.

A Journal of Useful Arts, Science, and Mining and Mechanical Progress.

## Brown & Level's Boat-Detaching Apparatus.

This eminently useful California invention, for which letters patent were applied for through this office, was first described in the MINING AND SCIENTIFIC PRESS of December 2d, 1865, at which time we gave a full report of the first public trial to which it was submitted. The invention has since attracted much attention at the East, not only on the part of private individuals, but of government as well—several officers of the navy having reported highly of its efficiency and value. What person that has read the reports of the numerous shipwrecks of passenger vessels, particularly of steamers, has not shuddered at the recital of the terrible destruction of human life which has occurred from the launching of boats from vessels in distress; and when it is recollected that those accidents have generally been caused by the imperfect arrangement of the apparatus for disengaging the boats, the importance of any device for remedying this terrible defect in nautical apparatus, must be strikingly apparent. This desirable end is probably as nearly accomplished by Brown & Level's invention, as can possibly be done by human contrivance. The device is simple and infallible in its operation, and not liable to get out of order. So far as we have learned, it has received the unanimous approbation of every seaman who has witnessed its operation. In order that it may be more fully understood, we give the following illustration of the manner of its use:

In Fig. 1 we give a perspective view of a boat as suspended from the davits and falls, A, A. The disengaging apparatus is seen at B, B. The lock that holds it securely in place is seen at P. By raising the latch of the lock and throwing the lever, G, backward, the boat is disengaged from the falls and landed safely and handsomely upon the water. In Fig. 2 we give a sectional view of a boat fitted with this apparatus. A, A are the falls by which it is suspended. C, C are bent levers, which pass through mortises in the central part of B. I, I are shackle hooks that are pivoted in the top end of B, and when engaged are securely held in an eye in the upper end of C. D, D are rods that are connected to the lower end of C, and are operated by the handle and lever, G, which is hung on a pivot at E. By throwing the lever, G, backward or toward the stern of the boat, the rods, D, operate upon the bent lever, C, thereby releasing their shackle-hooks, B, from their confinement in the eye of C, and it will be

## Patent Boat-Disengaging Apparatus.

Fig. 3

seen that the hooks of the tackle-blocks are simultaneously disengaged, and the boat with its occupants descends evenly upon the water.

In Fig. 3 is given an enlarged view of the disengaging apparatus. C is the shackle-hook, confined by the eye, D, of the bent

lever, B. A is the bar through the mortise of which the bent lever passes, and is held in place and turns upon a pin passing transversely through it. At E is seen another mortise, by which the apparatus is attached to the keel of the boat by a strong bolt. To give further steadiness and security, two ears are seen at F, through which bolts pass and are held by nuts under the deck-covering of the boat. It will be seen that if the bent lever, B, is thrown into the position as shown in the dotted lines, it will release the shackle-hook, C, from any pressure it may sustain.

The lock by which the apparatus is held in place at the will of the operator, is shown enlarged at Fig. 4. A is a plate bolted securely to a seat in the boat. The latch, B, is hinged at C, and when closed is securely held from any oblique motion by the shoulders or studs, E. At D is seen the mortise or opening in which the arm of the lever, G, Fig. 2, rests, being held in place by the latch. When the boat is to be launched the operator raises the latch, B, throws the lever, G, backward, and by this simple and easy operation the launch is effected.

In attaching the apparatus to boats, no changes of the davits, falls, or of any of the rigging is required to operate them. This is a great saving of trouble and expense, as a boat having the apparatus attached to it can as easily be raised, lowered, and detached from one vessel as another.

This apparatus has been adopted by the United States Revenue Marine, and is unanimously recommended by the Board of the United States Supervising Inspectors of steamboats, at their annual session at Buffalo, October 18, 1866. It is also recommended by the Hon. H. McCulloch, Secretary of the Treasury, and by numerous officers of the revenue service, also by the officers of the Cunard service, Pacific mail steamers, and many others that we have not space to enumerate. It is now being introduced on all of the most important lines of steamers.

The invention was patented by S. Brown and Leon Level, of New York city, (formerly of San Francisco.) The apparatus is manufactured by the "Brown and Level Life-saving Tackle Company."

THE DURABILITY OF SUBMARINE CABLES.—It is said that the submarine cable between Malta and Alexandria, which has now been submerged only about six years, is fast going to decay. It is constantly requiring repairs, which are made by taking up such portions as are found to be faulty, and supplying new sections. The insulating covering is fast becoming decomposed, and the wire itself is in process of rapid disintegration. The same condition of things was found to exist in the Cagliani and Bonah

cable, after it had been down only about two years. The Atlantic cables both have the same, or very similar, protection; and notwithstanding the successful recovery and working of the first one, after it had been down a year, there is much reason to fear that two or three years more may render it totally unfit for use. Perhaps it may be in view of this possible fact, that the directors keep up the high rate of charges; thinking it no more than right that the company should look to a full realization of both interest and principal in three or four years, which the present income bids fair to bring about.

A MISSOURI blacksmith has prepared a horse shoe for the Paris Exhibition, made of raw ore from Iron Mountain. Half the shoe is finished, and the other half shows the ore as it is dug from the mine.

WORM-EATEN WOOD may be saved from further ravages by fumigating it with benzine, whereby the worm is destroyed.

## Communications.

IN THIS DEPARTMENT we invite the FREE DISCUSSION of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[Written for the Mining and Scientific Press.]

## The Reduction and Concentration of Auriferous Ores.

BY DR. L. LANSZWEERT.

EDITORS PRESS:—There is an old proverb, that "Prosperity makes friends and adversity tries them;" and although not usually applied precisely as at present, it is thoroughly applicable. Whilst the mines were yielding good returns, enormous quantities of ores were unskillfully reduced, yielding rich tailings. Moreover, large quantities of poor ores were raised and thrown aside, because requiring some special treatment, and these "friends" obtained (but not valued) in prosperity may now be turned to profit in adversity, and it is not unlikely that they will prove a source of profit that will render the mines at least independent of assessment, if they do not enable them to declare large dividends. The number of concentrators which have from time to time been brought forward for treating tailings and this low class of ore is, doubtless, large; but except in isolated instances they are still unused; and now that something is really required to aid the mine and mill adventurer, so fertile a source of profit should certainly not be passed over.

There is room enough for all, and therefore no invention should be condemned until the processes have been fairly tested. The result of any practicable machine will in most cases be a large profit to those who have sufficient confidence to give it a fair trial. The following has been compiled from a report of Mr. H. A. Thompson, for many years connected with the Port Phillip and Colonial Gold Mining Company, Clunes, Australia. The results of his experiments extend over six or seven years, with a view of diminishing the heavy loss of gold now sustained in reducing quartz. These experiments were made at the Port Phillip Company's works, at Clunes, and are the more important, as at that large establishment there is every facility for conducting the trials upon a working scale, while an assay office, attached to the works, allows of every step being tested with such accuracy as alone can make the result obtained reliable.

For this colony assays of tailings from many different gold fields have led to the conclusion that the average loss sustained in crushing is not less than thirty-five per cent.; and several instances have come under notice where there was a large percentage of sulphides in the quartz, where the loss of gold was, in consequence, from fifty to seventy per cent. of the total contents. For convenience, the gold found in mineral veins may be divided into two classes: First, the free gold, meaning that deposited in the quartz or slate in a form rendering it capable of liberation by the ordinary processes of crushing; and, second, the pyritous gold, meaning that deposited with, and enveloped by, the sulphides of iron, copper, antimony and lead; but principally iron in Australia. The greater part of the free gold is deposited in particles large enough to be liberated and retained by the ordinary reducing process; but in all gold-bearing quartz a certain amount of fine gold exists, which cannot be retained by the usual mode of treatment; and in some few exceptional cases the proportion of the fine gold is so considerable as to form nearly one-half of the gold lost. This fine gold, when seen in the quartz, presents the appearance of minute patches of gilding, and must be detached in thin, flat pieces, readily floated away in running water.

A part may be pyritous gold, liberated in the breaking up of the iron ores. For practical working, some of this fine gold must always be lost, even where the greatest care is used; but a large proportion of that now carried away would be retained with the pyrites by any efficient mode of concentrating the latter. The pyritous gold is so

closely incorporated with the iron and other ores, that it cannot be separated by the means used for extracting the free gold. A question has arisen whether this pyritous gold exists in combination with the sulphides or in a metallic state. Experiments made at Clunes, using hyposulphite of soda as the dissolving agent, showed a trace of other than metallic gold in rich pyrites, but none in auriferous antimony ore. For the first class the quantity was evidently so small as to be of no practical importance—nearly all the gold being mechanically deposited with the pyrites. A sample washed from the blankets, in which the particles of pyrites average about 1.1000th of an inch in diameter, gold can be seen on the broken faces in still smaller particles; and it is believed the great bulk of the pyritous gold is in this finely divided state. From ten to forty ounces of gold per ton may be taken as the average yield of the sulphides in paying quartz mines; but both higher and lower yields have been met with.

It is not the sulphides only that exist in the quartz veins that are auriferous. Many of the blue slate beds, at a distance of several fathoms from the mineral veins, contain pyrites in scattered crystals studding the rock. These crystals have been collected, and, on assay, gave from five to fifteen dwts. of gold per ton. This fact may throw some light on the cause of quartz veins being frequently productive above, and poor below the water line—a circumstance usually ascribed to the pyrites being undecomposed below the water. This cause is hardly sufficient to account for the sudden failure of the gold in depth in some cases, and it is possible that the existence of large quantities of undecomposed pyrites, in the adjoining slate beds, may have an impoverishing effect, by holding the gold and preventing its aggregation in the quartz veins.

Hitherto we have only referred to the sulphides found in the quartz or slate; but in the old auriferous drifts of Ballarat, trunks of old trees are found imbedded in the gravel, and on this old timber, pyrites have frequently formed. A beautiful specimen of crystallized white iron pyrites, deposited on a piece of wood taken from a drift immediately below the trap rock, gave by assay forty ounces of gold per ton! In another case where the old trunks were burst open, and only the sulphides formed in the heart of the tree were saved, the yield was over 80 dwts. of gold per ton! Some of the fine dust obtained in working out the gold at the Royal Salmon claim, Ballarat, yielded by assay over fifteen ounces of gold per ton. When placed under the microscope, this dust was seen to be composed of minute crystals of pyrites, aggregated into round pellets, being 1-300ths to 1-100th of an inch in diameter; the surface being roughened by the projecting angles of the crystals, and not water-worn. These results show that the deposition of gold in connection with pyrites has been in operation at a comparatively recent date, and is probably still going on.

To enter into all the details of the researches made, would extend this paper to too great a length; and it will be sufficient to state that in careful trials, including assays of total contents, different modes of amalgamation to ascertain the amount of free gold, and microscopic examinations, indicated that the bulk of the gold lost was enveloped in pyrites. Except in rare instances, not more than one-fourth of the loss being free of gold, and this was usually in small flaky pieces, floated off with the water.

The proportion of the free gold left in the tailings will depend on the fine or coarse particles in which it may have been deposited in the quartz, and also on the more or less perfect character of the means used for retaining it. A small percentage also exists in the form of gold still attached to particles of quartz. As already stated, more than seventy-five per cent. of the gold lost was in sulphides; the separation of the sulphides from the comparatively worthless sand, therefore reducing the bulk of the material to be acted on, and then to extract the gold, is to bring to perfection the several systems of concentration. There is so little difference between the respective specific gravities of the quartz and iron pyrites, that the separation of one from the other in any known machine, even with particles of nearly the same size, would be imperfect; but this difficulty is vastly increased through the pyrites being more friable than the quartz, and therefore broken under the stamps into much smaller particles. This difference in size counterbalances the difference in the specific gravities, where water concentration only is used; thus nullifying the principle on which all the systems of ore dressing in general use are based.

An attempt was made to classify the sand, but it was found that half the gold in the

waste tailings was inclosed in particles of sand and pyrites, in such a minute state of division, that it could be passed through the wire gauze having 3,600 meshes to the square inch; and as it was evidently impracticable to pass 100 tons of sand per day through sieves of this kind, the idea of direct classification was given up. A trial was made on the classifying boxes introduced by Mr. Ulrich, where the coarser sand and heavier sulphides pass out with the water flowing from a lower, and the lighter particles from an upper escape. By this method the sand can be divided into two several different qualities; but the classification is not according to size only, and is therefore imperfect. The coarse particles of pyrites only were returned on the blankets; but the finer pieces floated away, and no dressing machine hitherto tried would retain more than a small proportion of those fine sulphides.

The best result was obtained from the round, concave buddle, with the improvements patented by Mr. Munday; and this machine is now being worked to advantage at Clunes and other places; but it falls far short of the requirements of the case, and the endeavor to discover a better system was in consequence not relaxed. After proving most of the known dressing machines, and many modifications of old plans which it was hoped might overcome the difficulties in the way, without success, a trial was made of the percussion table, a dressing machine much used in Germany and South America.

[Concluded next week.]

[Written for the Mining and Scientific Press.]

## Mill Experiments.

MESSRS. EDITORS:—In your issue of the 16th, you publish an account of some "interesting mill experiments," made at the Pennsylvania mill, Brown's Valley, with tailings. It is stated that tailings from a battery of four stamps, after passing over riffles and copper plates, were fed continuously into a Chile mill with constant discharge—time not given,—no results obtained. That another Chile mill was charged with a batch of ten shovelfuls of sand, which were worked for two hours, and then discharged. The result obtained from twelve such batches (120 shovelfuls) was eight ounces of amalgam. Another was charged in same manner, but worked three instead of two hours, with a result for eight batches of 16 ounces of amalgam—200 per cent. more. Another Chile mill, charged in same way, but worked for four instead of two hours, gave a result of 24 ounces amalgam—300 per cent. more.

We are not advised whether all the tailings thus worked were of the same quality as those supplied for the first experiment. Whether all direct from the battery, or some from a pile. If from a pile, was any precaution taken to obtain them fairly, and of equal value? Or was one run made from the top of the pile, another from the bottom, another near the discharge, another away from it?

In the absence of knowledge as to how those experiments were made, they possess but little interest, and no value to those not interested in the mill, who have the satisfaction of knowing that 260 shovelfuls—equal, probably, to 1½ tons of tailings, the product of about 2½ tons of ore afforded 48 ounces of amalgam—which, at its probable value of \$5 per ounce, would be \$240 for 2½ tons, or \$96 for one ton of ore—a very large result to obtain by any such process. I omit five ounces of amalgam obtained from box outside—they may be spared, but added would show over \$100 a ton.

As the Chile mill is usually employed to work the "blanket washings," after they have passed over riffles of mercury and copper plates, I may be excused for suggesting that the experiments 2, 3 and 4, were probably made with blanket concentrations.

T. M.

We regret, equally with our correspondent, the difficulty of procuring reliable reports of mill and other experiments, with regard to mining. The Brown's Valley experiments, if they had been accurately made, and stated in detail, would have a most important value. As they are such that might easily be made at almost any mill, fitted up with pans or Chile mills, we trust some of our enterprising mill owners will report them and communicate the result to us for the benefit of the public.—[Eds. Press.]

## Home Productions.

A superior quality of farina, maccaroni and vermicelli, in quantities almost sufficient to put a stop to foreign importation, has, for many years, been manufactured at the establishment of Messrs. Brignardello, Macchiavello & Co., in this city, having the reputation of being similar in every respect to the imported article—being, in fact, put up here after the most approved French and Italian style of preparation, and from the same kind of wheat. The species of wheat used for first quality of farina, has a very hard grain and is dark-colored throughout, the seed having been first imported about ten years ago. It grows well in Contra Costa county, Santa Clara, and perhaps in some other counties; showing, however, a decided tendency to degenerate, and requiring a renewal of the seed every two years. It is furnished at the mill by contract, at two cents per pound; the rate ruling somewhat higher than the average of the best California wheat, in consequence of the very limited demand. This class of farina, together with the different forms of maccaroni, vermicelli, and other preparations from it, is well known to be not only a wholesome and nutritious article of food to the healthy and vigorous; but, owing to its remarkable delicacy, and the "life-giving" properties it possesses, has become as a diet almost indispensable, both for the sick-room and nursery.

A second-class farina, not quite so palatable and digestible, perhaps, and worth about one-third less in the market than the former—made from our best white flour—is also prepared in considerable quantity here, as also in one or two other places in this city, and in some portions of the United States; but so far as we have been able to ascertain, the firm above mentioned have the only manufactory to be found anywhere within the limits of the United States for the first and best quality, produced from the imported seed. This may be cited as another instance in which our young State takes the lead of her older sisters, competing with the foreign market in raising the raw material, and that under some disadvantages, and in furnishing from the same the almost entire supply for home consumption—turning out, last year, about 20,000 boxes of maccaroni, using 10,000 sacks of the Russian wheat for the first quality, and 600 barrels of California flour for the second quality.

As curiosity led us to witness something of the *modus* of its preparation, a brief description of some of the stages through which it passes before it takes its place in the ware-house as an article of commerce, may not be without interest to others. The grain is ground, or rather crushed—but not so fine as flour in a grist-mill—the bran being partially separated by the ordinary screen used in the same. It then passes through from three to five different manipulations, through as many somewhat differently perforated sieves, worked by skillful hands—no machinery having as yet been invented capable of performing the delicate work required, so well as muscle and brain. After these processes it appears as pure farina. The next step is to throw it into a large vat, with sufficient water to give it the consistency of dough, adding the necessary quantity of cast steel saffron to furnish the proper color, as seen in the market. It is then kneaded for about an hour, by means of a large stone wheel, similar to that of a Chile mill. The dough is now prepared to go into a cylinder press, heated by steam, by which it is also forced through perforated plates inserted in the bottom of the same, having apertures of all the varied forms and sizes for making all the different kinds of maccaroni, vermicelli and paste, that ever graced the shelf of the grocer, or the table of the epicure. The mill, with all its machinery, is driven by a 25-horse power engine, built at the Miners' Foundry.

## Mechanical.

## Improvements in the Manufacture of Steel.

Improvements in the manufacture of iron and steel are still sought after with all the appliances which ingenuity and science can suggest. The discovery of the pneumatic or Bessemer process appears to have opened a wide field for research in this direction, although that process has by no means superseded that of "cementation." The most that it has done has been to furnish an inferior quality of steel, at so low a price as to allow of its much more general introduction into the useful arts than had previously been proved economical. Bessemer steel has not yet been obtained of so good a quality as to take the place of that produced by cementation, for numerous applications in the way of machinery, to say nothing of the manufacture of tools, etc. Indeed, there are but very few localities that produces an ore suitable for first-class steel, even by "cementation." Nearly all the good quality of steel manufactured in England is from Swedish iron, imported at a cost of from \$150 to \$175 per ton.

Even the Bessemer process for inferior steel, can be made successful only by the employment of iron made from certain classes of ores. Pig iron, which contains over one-tenth of one per cent. of sulphur, or seventy-five one-thousandth part of phosphorus, or one and three-quarters of one per cent. of silicon, is not suitable for Bessemer steel.

And since most of the American pig iron is made with coal containing more or less sulphur, and as our magnetic iron ores contain a considerable percentage of both sulphur and phosphorus, they are, to a great extent, unsuitable for the Bessemer process. In fact, the opinion of scientific and thoroughly informed men at the present time, inclines to the idea that any Bessemer steel which can be made in this country will be found unsuitable for many uses to which it is applied in Europe, and applicable to little else than railroad iron, or some similar purpose, where a very inferior article can be made to answer. A good quality of Bessemer steel cannot be made here, until we can obtain a quality of pig iron more suitable for such manufacture than any yet produced in this country.

## THE HYDROGEN PROCESS.

While, however, we are laboring under this disability, it appears that a more recent invention than Bessemer's bids fair to take precedence of both that and the "cementation" process. It is said to be cheaper than the former, and about, if not fully, equal in excellence to the latter. It is known as the "hydrogen process." The best ore for this process is said to be found in inexhaustible quantities in New Jersey, and is nothing else than the well known "Franklinite," of that State.

This ore contains, according to Dana, about sixty per cent. of oxide of iron, fifteen of manganese, and seventeen of zinc, with an earthy residue—a most remarkable mineral compound, found nowhere else, we believe, on the earth. When mixed with ten or fifteen per cent. of magnetic iron ore, and combined with hydrogen in the blast furnace, Franklinite furnishes a natural flux and purifier of iron. The zinc unites with the sulphur and phosphorus in the ore, and passes off with them in a volatile form; while the great heat produced by the use of hydrogen reduces a large portion of the manganese to a metal, and turns out a quality of refined iron, said to be the very best for the manufacture of superior steel.

The refining of this iron can be carried still further, and the uncertain carbonate, produced by the above process, converted into a pure hydrate of iron, which may be run into a converting furnace, and there readily re-carbonized to the precise extent desired; when it may be cast into ingots of steel, of a quality quite equal to that pro-

duced by the ordinary cementation process, and at a greatly reduced cost, as will be readily apparent to any one acquainted with steel manufacture, who will take the trouble to consider for a moment the manipulation of the two processes.

The "hydrogen process" is already in successful operation in Europe; and it is stated by experienced iron masters, who have tried it with various suitable furnaces, and with different kinds of coal, that the saving of fuel in this process is fully one-third.

The process has not yet received a fair trial in the United States. The first experiments were made on other ores than Franklinite, with lime only as a flux. It is now said that by using the Franklinite, as above described, with a very little lime, all difficulties in the way of this mode of obtaining steel will be removed. It was recently stated in the *New York Journal of Commerce*, that this process will soon be put into operation, with the New Jersey ores, on a large scale. The experiments already made, taken in connection with the well established results in Europe, seem to leave no doubt of the fullest success for the new enterprise, which will also develop our valuable deposits of Franklinite, for the reason that no feasible system of working them has hitherto been devised. Attempts have been made to work this ore for zinc, but without success. The problem of their true mode of utilization will, doubtless, soon be practically demonstrated.

## STILL ANOTHER PROCESS HINTED AT.

It will be interesting, in this connection, to briefly allude to another line of investigation into the problem of steel manufacture, which is founded on the recently discovered absorbent capacity of iron, and which we find alluded to as follows in a late Eastern exchange:

Recent investigations by Mr. Graham, the master of the British Mint, have led to the conclusion that pure iron is capable of absorbing at a red heat, and of retaining, when cold, 4.15 times its volume of carbonic oxide gas; and that wrought iron, in the course of its preparation, may thus occlude six or eight times its volume of the gas, which is carried about with it ever after. Mr. Graham found in his experiments that a wrought iron wire gives off this gas freely at a red heat, and again, at the same temperature in an atmosphere of carbonic oxide, as freely absorbs it. The further pursuit of this suggestive discovery will very likely have an important bearing on the improvement of iron and the manufacture of steel. The decomposition of carbonic oxide at a high temperature for the production of steel, with the fact developed by Mr. Graham, that the gas is most freely absorbed by iron at a low red heat, suggested to him the possibility that the conversion might be promoted by frequent alternations of temperature.

THE first iron planing machine is believed to have been made in 1794, at Messrs. Horrocks, Miller & Co's works, Preston, England. It was designed for planing mule tracks, was five feet long, had a cross-beam and sliding-tool, and the carriage was worked by hand through a drum and chain. Mr. Richard Robert's first planing machine, made in 1817, was five feet long; the carriage being moved by hand through a drum and chain.

TO REMOVE THE TASTE FROM NEW WOOD. A new keg, churn, bucket, or other wooden vessel will generally communicate a disagreeable odor to anything that is put into it. To prevent this inconvenience, first scald the vessel with boiling water letting the water remain in it till cold. Then dissolve some pearlsh or soda in lukewarm water, adding a bit of lime to it, and wash the inside of the vessel well with the solution. Afterwards scald the vessel well with plain hot water, and rinse it with cold water before you use it.

IMPROVED STEEL MASTS.—This is the latest application of the Bessemer product; substituting much lighter and slenderer tubes of steel, for the wrought iron article which had already been applied to some extent in the British navy in place of "sticks." The new mast is strengthened by transverse longitudinal plates.

## Scientific Miscellany.

## Recent Chemical Discoveries.

The London *Quarterly Journal of Science*, for January, reports a number of new and interesting facts in chemical research, which have been announced since its previous quarterly issue. Among them we note the following:

A NEW METAL.—M. Meisner and Rosler, of Germany, announce the discovery of a new metal, allied to the alkaline series, and which gives a sharp, dark-blue line in the spectroscopic, in a different position from that given by iridium. The discovery was made during the process of a mineral analysis. They promise a further account of the metal at an early day.

ZINC.—In connection with zinc, some notes by Renault are referred to on the phosphoreted compounds of that metal. Renault finds that zinc and phosphorus unite in many and variable proportions—six of which phosphides he describes, and one of which in particular is worthy of note. This is the compound  $Zn^3P$ , which will keep, without change, in the open air, and serve well for the preparation of spontaneously inflammable phosphoreted hydrogen. This compound is prepared by mixing one equivalent of phosphate of magnesia with two of artificial sulphide of zinc and seven of carbon. The mixture is heated in an earthen crucible, and the phosphide of zinc sublimes. Hydrochloric acid, added to fragments of the phosphide, causes the evolution of gas which inflames at  $30^\circ$ ; but with the powder, the spontaneously inflammable gas is obtained.

A NEW ETHER.—On the border-land, between mineral and purely organic chemistry, we notice the formation, by R. Maly, of an ether of tungstic acid, by treating oxychloride of tungsten with strong alcohol. This tungstic ether forms a hard, brittle, glassy mass, insoluble in water, alcohol or ether. When heated on platinum foil, it burns with a smoky flame, and in the end yellow tungstic acid is left as a residue.

TANNIN FROM COAL.—Mr. Skay communicates to the *Chemical News*, the fact that a substance resembling artificial tannin is produced by the action of nitric acid on bituminous coal and lignite. The substance is soluble in water, has a bitter taste, and is precipitated from its solution by gelatin and albumen.

SPONTANEOUS CHANGE IN CHLOROFORM. It has recently been ascertained that chloroform is subject to a spontaneous alteration, which results in the disengagement of phosgene gas. The presence of this gas may generally be detected by the smell, but Stadler has ascertained that bilirubin, the red coloring matter of bile, when brought in contact with altered chloroform, turns orange-red and soon afterward green. Bilirubin may be obtained sufficiently pure for a test in the following manner: Place a small quantity of fresh bile in a test tube; dilute with water and acidulate with a few drops of hydrochloric acid; then add a little bisulphide of carbon; shake well; allow the bisulphide to co-operate; and wash the residue with alcohol and ether. The undissolved red powder which remains is bilirubin.

TO ESTIMATE THE RESIN IN SOAP.—A method, of some practical interest, is given by Mr. Sutherland, for estimating the amount of resin in soap: The soap is first decomposed by boiling with strong hydrochloric acid; then treat the mass of mixed, fatty and resinous acids with strong nitric acid, by which the resinous matter is converted into soluble tenbic acid, while the fatty acid is left comparatively unacted on. The process, though not rigidly exact, is very useful for ordinary practical purposes.

MICA, in its chemical nature, is a silicate—a glass—there is no solvent for it known; at least none from which it can be recovered.

THE SPONTANEOUS IGNITION OF COLORED FIRES.—From some experiments made by Chas. Bullock, Esq., of Philadelphia, it appears that the use of flower of sulphur in these mixtures is a fruitful cause of such action. By preparing a material without this ingredient, which may be very successfully accomplished in most cases, it will keep well for years.

Two correspondents of the London *Chemical News*, Mr. Spiller and Mr. Clark, have also called attention to the important fact of the liability to spontaneous combustion of the compositions for making red and purple fires. The composition for the latter, made with the black oxide of copper, as it usually is, is almost certain to inflame, spontaneously, sooner or later. He suggests that carbonate of copper should be used instead of the oxide.

PAPER which turns pale ink at once black, called by its inventor carbonized paper, has been devised by Mr. J. E. Hoyer, of Philadelphia. The action claimed is effected without any detriment to the character or durability of the paper; since the means employed is the introduction into the glazing of a neutral carbonate, which, while effecting a prompt oxidation of the ink, has none but a beneficial action on the fiber of the paper.

PNEUMATIC TUBES.—The French are introducing pneumatic tubes into Paris. They are operated, however, on a principle the reverse of those in London. While the English exhaust the air in advance of the pneumatic car, the Parisians compress it behind. It is found that the pressure required is only one atmosphere and a half. The French mode will probably be found both the simplest and cheapest.

WATER MARKS on paper are made by the deposition of the pulps during the manufacture, in a thin layer or a sieve of fine wire. Any device which may be woven into the net-work will be above the general surface of the sheet, which will be thinner there, and transmit the light more readily than other portions of the sheet. Hence the appearance of "water marks."

If the current of sparks of an induction coil be passed through the luminous flame of gas or a candle, no alteration is seen in the flame, excepting that in the path of the sparks the flame is intensely luminous. If, however, the flame be examined by means of the rotating mirror, it is found that the flame is always extinguished above during the passage of an individual spark. The part below the spark is constant and steady.

ELECTRIC "FLUID" OR ELECTRIC FORCE? The later discussions tend toward the theory that a conductor of electricity is a medium for the transmission of a force or effect, rather than a channel for the locomotion of an agent. In this direction there is a chance for discovering the physical properties which render conducting substances susceptible to electric force, and those which disqualify others.

VARIABILITY OF ATMOSPHERIC ELECTRICITY.—The quantity of atmospheric electricity at noon, is much greater in winter than in summer, the relation being about ten to one. This augmentation of electric force proceeds in a manner almost parallel, with the number of days of frost or fog, and inversely as the number of days of thunder, elevation of temperature, and actinic power.

PLANT DEVELOPMENT.—M. Quetelet says that careful observations have convinced him that a plant develops much more rapidly during a mean temperature, when this temperature varies, than when it is uniform, provided that it does not fall below freezing point. He is also of the opinion that the effect produced is equal to the square of the temperature.

SUBMARINE PHOTOGRAPHY.—M. Bazin has obtained clear submarine photographs at a depth of 300 feet, in his diving studio, by means of the electric light thrown through water-tight lens windows upon the objects to be photographed. The value of this invention in submarine surveying is obvious.

CHLOROFORM is an excellent article for the removal of stains of paint from clothes, etc. Portions of dry white paint which successfully resist the action of ether, benzole, and bisulphide of carbon, are at once dissolved by chloroform.

## A New Steam Stamping Quartz Mill.

Various methods have from time to time been devised, both in California and the Eastern States, for the direct application of steam to quartz mill stamps, after the manner of the application of steam to the hammer. Our knowledge of these efforts, however, has been derived only through the records of the Patent Office, and the various scientific and mechanical publications of the East, until our attention was called, a few days since, to the recent invention of James & Condicts, one of whose mills—a small prospecting machine—has recently been sent to this city, to the charge of J. Ross Browne, our Commissioner of Mining Statistics, who has placed it on exhibition at the Pacific Foundry.

This machine is quite different in its construction from any other to which our attention has been called. It consists of a battery of two stamps, the peculiar character of which is that the downward movement of the stamps is effected by the aid of high-pressure steam, while the upward movement is produced by steam at a low pressure. Of course the stamp-heads are affixed directly to the pistons. The induction and eduction of the steam to the upper portion of the cylinder, which produces the "strike" of the stamp, is made through a direct communication with the hoiler, and may be kept at any desirable rate of high pressure. The stamps are lifted by low-pressure steam, introduced into the cylinders, and kept in constant communication, without the intervention of working valves, from a steam-chamber having such a minute connection with the hoiler as to keep up only the degree of pressure necessary to raise the stamps and prevent an excess of condensation. Of course, when the piston is driven down, the lifting force from the low-pressure steam-chamber, which maintains a constant resistance in the cylinder, must be overcome; but as that is only ten pounds to the inch, it is found more economical to increase the steam in the hoiler, say from 70 to 80 pounds, to overcome that ten pounds of constant resistance, than to waste a whole cylinderful of high-pressure steam at every stroke merely to raise the stamp. The induction and eduction to and from the upper end of the cylinder, is alternately effected by a tappet motion produced by the movements of the stamp-stems themselves. The action of the steam which effects the blow being controlled by the upward movement of the piston, and the steam which produces the lift being constant in its pressure; the greater or less descent of the stamp, incident to the greater or less amount of rock beneath it, may always be readily accommodated.

We learn from Prof. Whitney that this principle of actuating the movement of a steam piston has already been successfully applied to working rock. Some twenty years ago, a Mr. Ball invented a crusher on a somewhat similar plan, which has been for many years in successful operation in the Lake Superior copper districts. The mechanical contrivances by which the principle is applied by Messrs. James & Condicts is probably an improvement on the Lake Superior machine. We see no reason why the principle employed might not be made especially serviceable for many other mechanical purposes, where the power required is unequal and reciprocating, as in the raising of full huckets and lowering of empty ones, in mines and other places, the driving of steam hammers, etc.

It is impossible to judge of the practical value of such a machine by witnessing a mere trial of its capacity. It is certainly simple and effective in its action, and by the rapidity and force with which the stamps may be driven, it is possible to turn out a large amount of work with a very small machine. How it will stand the long-continued and rough usage inseparable from quartz-crushing, we cannot say. It is light, occu-

pies but little room, and is constructed so as to admit of a most economical use of power. We should suppose such a machine would be found especially serviceable for a prospecting mill. It is only about two feet square and six feet high, including stamps, mortar and cylinder, but without a hoiler. It does not weigh over 1,500 pounds. The machine is well worth the attention of our mill men.

It is the invention of Christopher R. James, of Jersey City, N. Y. The patent was issued to James and Nathan W. Condict, Jr. It may be seen at the Pacific Foundry, in this city. J. Ross Browne is agent for inventors for this coast.

## Contributed for Our Cabinet.

Under this heading we shall continue to mention and describe, according to merit, such specimens of ores, minerals, fossils, curiosities, etc., as may be presented, or forwarded to us by mail or express, prepaid. Each article will be numbered and placed in our cabinet, and recorded with the name of the donor, and the claim or location from whence it came.

140.—MR. E. M. ROBERTS, of this city, has laid upon our table some samples of spathic iron ore, from Lower California. We are not advised as to whether it occurs in workable quantities. This is a very valuable ore, and is abundant in the coal and iron regions of Pennsylvania, and many parts of the West. It is extensively employed in Pennsylvania in the manufacture of iron and steel. The ore is known as *Chalybite*; is a carbonate of iron, consisting of about 35 per cent. of  $\text{CO}_2$ , 54 per cent. of FeO, with small quantities of manganese, magnesia and lime.

141.—MR. GEO. H. BELDEN, Superintendent of the Portland (Oregon) Iron Works, has sent us some specimens from the ore-beds from which that company will derive the ore for their furnaces. The ore is a brown hematite of a very superior quality, such as would probably yield from 50 to 60 per cent. of iron. Analysis of this ore show about 77 per cent. of sesquioxide of iron, 11 per cent. of moisture, and 12 per cent. of silica, with a mere trace of sulphur. We hope soon to be able to give some working results from this furnace—the first and only enterprise of the kind on the Pacific Coast.

CINNABAR IN MONTANA.—A correspondent writing from Virginia City, Montana, says that the report, which became current some time since of the existence of cinnabar in the ground of the Brooklyn Golden Ore Mining Company, is not correct. The author of the report mistook hydrated red oxide of iron for cinnabar, and the graphite in the granite of Brown's Gulch for the bromide of mercury. Our correspondent adds: "I am satisfied that cinnabar exists in our mountains, having myself seen a small specimen, found in a creek between the Jefferson river and Helena."

CALIFORNIA FARMING COMPANY.—A company under this name has been formed in this city, with a capital of \$1,000,000, divided into 10,000 shares of \$100 each. The object of the company is the furnishing the laboring farmer with capital to cultivate his land to better advantage than his private cash means will allow. Also the purchasing of agricultural land, one half of which will be cultivated for account of the company, and the other half divided among the shareholders, to be worked for their own account.

ARIZONA SALT.—Capt. Rogers—who is known as having been the first to take a steamer up the Colorado river to Callville, the head of navigation—has shown us a beautiful crystal of rock salt from that Territory. It is a cube of one inch diameter, and so perfectly clear that fine print can be read through it with perfect ease.

"A YOUNG MAN'S MISSION."—We have received a copy of a sermon with the above title, preached by Rev. Dr. Wadsworth, in Calvary church, on the evening of Sunday, February 17th.

## New Patents and Inventions.

Under this heading we shall mention, from week to week as occasion may demand, New and Important Inventions; also, the List of Patent Claims recently issued from the U. S. Patent Office to inventors on the Pacific Coast, and other Patent Issues which we deem of local interest to readers on this side of the Continent. Most Patents on this coast are secured through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We are prepared to obtain from Washington, with despatch, copies of any Patent issue.

### PATENTS RECENTLY ISSUED.

62,127.—RAILWAY CAR.—Ab'm Gregg, Forest City, Cal.;

I claim, 1st, The method of attachment of the extreme ends of the trucks to the car by king-bolts, g', so that the brakes can be worked in the center of each shaft; also the combination and arrangement of the hox-coupling, D, to the center of the axle, so as to insure the two-fold purpose of a brake-wheel and coupling.

2d, The combination and arrangement of the double-acting brake, E, E, with springs, F, and levers, I, H and K, so that it will clasp both sides of the wheel at the same time with equal pressure.

3d, The two bearings, a, a, to each section of the axle to prevent hindering in the coupling-box; likewise planing the springs, f, f, between the trucks and platform and carriage, so that the shaft will have bearings near its center.

4th, The cross-tongue, h, attached to street cars when operating in parallel slots, i, i, so that when a car passes a curve the outer end of the cross will move back in the slot, bringing the draught on the outer end of said cross or tongue, substantially as described and for the purpose set forth.

62,160.—ROCK-CHAMBER DRILL.—Henry M. Stow, San Francisco, Cal.:

I claim the chisels, B, connected with the handle, C, in the manner described and for the purpose specified.

62,169.—COOKING RANGE.—Thomas C. Walter, San Francisco, Cal.:

I claim, 1st, The furnace, A, and the ovens, D and E, with the flues, K, F, f, and h, with their regulating dampers, constructed as described for the purpose set forth.

2d, The compartment, C, in combination with the furnace, A, arranged as described.

3d, The register, N, with the damper, m, and the damper, B, combined with the furnace, A, as described.

4th, The arrangement of the furnace, A, with the damper, B, and the register, N, the ovens, D and E, with their flues, and the compartment, C, all operating together substantially as and for the purpose set forth.

62,172.—SAD-IRON HEATING APPARATUS. Joseph Davis Westgate San Francisco, Cal.:

I claim an ironing apparatus, consisting of the sad-iron, B, and stove, A, constructed as herein described, lined with a non-conducting material, substantially as and for the purpose set forth.

62,053.—FIRE PLACE.—Warren P. Miller, San Francisco, California:

1st, I claim a lining or partition, g, made of suitable reflecting metal, and located within an air-heating chamber behind the fireplace or chamber, and separating the latter from the dead air chamber, substantially as and for the purpose specified.

2d, In combination with the partition, g, I claim the air-heating chamber, e c c, and dead air, or non-conducting chamber, d, all constructed and arranged in the manner and for the purpose specified.

### RECENT INVENTIONS.

A HOISTING INDICATOR.—Mr. F. Thayer, head engineer of the Savage Mining company's hoisting works, Virginia City, has invented, and has now in use at the Curtis shaft, a hoisting indicator which works to perfection in the way it was intended. The *Virginia Tresspass* describes it as built like the dial of a clock, with a single hand turning on a center axle, and by figures on the margin (to be changed with a new level is opened), to which the hand points as the cage descends or ascends the shaft, the engineer, without seeing either cage, shaft or rope, is enabled to know the precise level desired to be reached, or when the surface is attained. The old method has been to attach cloths around the rope, and thereby ascertain when the requisite level is reached. Mr. Thayer's invention entirely obviates this plan, and is perfectly accurate in its practical workings, never deviating an inch from the required point to be reached. This invention is of great benefit for two reasons: first, the cost of cloth for indicators, which becomes rapidly worn through constant friction, was at the Curtis shaft at least \$15 per month, and a light sufficiently brilliant to enable the engineer to see the marks on the rope cost a very considerable sum more. With Thayer's indicator, as stated before, neither cloth nor light is necessary to work the cage, except the light in the engine-room. A patent has been applied for.

## NEVADA MINERALOGIST'S REPORT.—Hon.

J. S. Mayhugh, member of the Nevada Legislature from Esmeralda, has sent us a copy of the annual report, for 1866, of Richard H. Stretch, Stato Mineralogist of Nevada. It contains a catalogue of all the principal minerals in that State, with their localities; a table of the quartz mills in the State; analyses of ores and waters, and an enumeration of nearly 150 mining districts of the State, with notes in regard to each. In addition to this, it has an article on "The Causes of the Decay of Mining Enterprises in many portions of the State," and another entitled "Hints for the Use of Prospectors, and persons engaged in the Early Development of Mining Property." It seems to be very complete, and will be an interesting and valuable book of reference.

ASSAYERS' MATERIALS of every description, as well as chemists' and druggists' glass ware, photographic stock, etc., may be found in great variety at the establishment of John Taylor & Co., on Washington street. They pay particular attention to the assaying and chemical branches of their business, and are always on the alert to select the fullest and best assortments attainable of all such articles as are needed to aid in the researches after, and development of, the mineral wealth of the Pacific coast. Call and see them.

RARE COLLECTION OF AMERICAN COINS.—Messrs. Repiton & Bumpus, of No. 626 Montgomery street, have perhaps the only complete set of American coins in the hands of private individuals in the United States. They have the American silver dollar for every year, from 1794 to 1866, half dollars from 1794 to 1867, quarter dollars from 1796 to 1867; dimes from 1796 to 1861; half dimes from 1794 to 1867; cents from 1723 to 1867; three-cent pieces from 1851 to 1867; two-cent pieces from 1863 to 1867, and half cents from 1793 to 1857. This collection has occupied more than fifteen years of Mr. Repiton's time, and cost about 20,000 dollars. As an instance of the rarity of some of the coins, we will state that the silver dollar of 1804 cost \$950, and Mr. R. had, before he succeeded in finding one he could purchase, made an unsuccessful tender of fifteen hundred dollars for one in the possession of a gentleman residing in Salem, Massachusetts. Of the silver dollar of 1838 only eighteen were minted, and consequently they are very rare. The silver dollar of 1852 is also very rare, and is rated by numismatologists at from \$300 to \$500. Besides this collection of American coins, Messrs. R. & B. have specimens of the coins of nearly all nations, and some coins over two thousand years old. The coins are a great curiosity, and their owners could readily sell them for fifty thousand dollars. *Morning Call.*

## City Amusements.

METROPOLITAN.—Heller has introduced several new and surprising tricks this week. Among these "The Mocha" and "A Photograph in the Negative," are very neatly performed. The "Spirit Sack" is the sensation this week, and shows that Heller's control of the spirits is about as great as that of the Davenport brothers. The musical portion of the entertainment is fully equal to his previous efforts, and charms all who are fortunate enough to hear it. As this is the last week but two, those who have not heard him should take the earliest opportunity.

OPERA HOUSE.—"The Fast Family" was produced at this house on Monday night, when Miss Kate Denin made her reappearance. Her acting as "Clothilde," who endeavors to reform the Benoit family, was extremely good. Mr. McCullough as "M. Didier," and Mrs. Edwin as "Blanche," were also very good. The same piece was played on Tuesday and Wednesday nights. Thursday evening was the occasion of a benefit to Henry Edwards, when "Julius Caesar" was played.

PLATT'S HALL.—The benefit of Mrs. Olmstead on Tuesday evening was a decided success, being attended by a good and well satisfied audience. Wednesday evening Madame Jaffa, the pianiste, gave her first grand concert. On Thursday, April 4th, Rosa Celeste, the rope walker, will receive a grand benefit, when she will make her first appearance since her accident. An immense bill will be presented, which should crowd the house.

## Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

## CALIFORNIA.

## Alpine County.

From the Silver Mountain *Bulletin* of March 9th: The Illinois California company cut the first ledge of the series owned by them on Monday. It is named the Franklin.

The George Washington company, owing to the storm, suspended operations some two weeks ago, but commenced again on Monday. The Mountain stopped for a few days, but has again resumed work with increased vigor, having struck softer rock. The Illinois California, in Raymond Dist., suspended work for a few days, but has got in motion again. The Pennsylvania has kept in motion during the storm, and is making good progress.

Same of 16th: In the George Washington there are many chimneys of good width to be seen, which, if followed down, would now give employment to a 10-stamp mill to its full capacity. The shaft now being sunk from the second level is producing good ores, and the tunnel at the extremity of the level reveals a chimney, the selected ores from which will average at least \$100 per ton.

From the Alpine *Miner* of March 16th: Work in the Mowyer goes bravely on, and the prospect is encouraging.

The workmen in the Tarshish tunnel struck quartz on Thursday.

## Amador County.

From the *Ledger* of March 23d: The new Atchison mill was put in operation last Monday. It has 20 stamps, and a Corliss' engine. The structure of the mill is of the most substantial character, and the arrangement is perfect.

At the Sutter Creek every thing is lively. It is one of the most thriving of mining towns.

## Calaveras County.

From the Copperopolis *Courier* of March 23d: The Angels Quartz Mining company have resumed work.

Stickles & Co's principal shaft is now 120 ft. in depth. The vein at the bottom of the shaft is 20 ft. wide, and pays the whole width.

Bovee & Co's new mill is running, and the mine pays well.

Prospects at Carson Hill are more flattering than ever. The quartz mills are in process of building.

## El Dorado County.

From the Plaverville *Courier* of March 23d:—Messrs. Gillenwaters & Christian are opening a cut to their rich ledge on the Poverty Point road. They have followed the vein some two hundred feet. This ledge is narrow but very rich. About thirty feet from this is another ledge, about three feet in width, owned by the same company. This ledge prospects about fifty dollars to the ton.

On Clay Hill, Grove & Crocker have their tunnel in thirty feet on a ledge of an average width of three feet. The rock prospects well. Burns & McBride have commenced a shaft about 400 ft. east of this. The shaft is down 20 ft. on a ledge 12 inches wide. Nearly 300 ft. north of this is another claim, owned and worked by Grove & Crocker. From various tests the poorest rock assayed a hundred dollars to the ton, while the richest assays as high as eleven hundred dollars. There is very little free gold. Some three hundred feet further north is the claim of Williamson, Chick & Co. Their shaft is down about 40 ft., at which depth the ledge is three feet in width, and widening. This rock will pay at least \$60 to the ton.

Work on the Woodside was resumed on Monday last. It will take three or four weeks to clear the mine of water. A battery of five stamps is to be driven by water power. They have rock enough on hand to keep them crushing for some time. The "Clipper Company" will commence operations next month. The "Eureka" have cleaned out their shaft, erected steam works for pumping and hoisting, and gone to work in good earnest. Mr. Pitch is prospecting a ledge about three miles below Georgetown, known as the "Bohannan" ledge. Here he is running a tunnel, which is in 122 ft. It is expected they will strike the ledge in about four months. The "Taylor" ledge, in the Johntown district, a short distance from the "Bohannan," is being prospected by Mr. Green. A few months will stamp this Divide as one of the richest regions in the State—capital alone is wanted to develop the mines. Yesterday, Mr. Moek, mining in a ravine near Dry Creek, about 2½ miles from town, took out a nugget of gold weighing \$195.

Georgetown correspondent of same says: The Low Claim, two miles north of town, has a shaft down 100 feet.... The Philadel-

phia Slide claim is on Cañon Creek, about one mile above Georgia Slide, and is the first southern extension of the Low claim. The shaft is down 14 ft. on an incline, and the ledge is seven feet wide, and full of the finest quartz and sulphurets.... Six pounds of picked rock from the Taylor mine prospected \$11. The ledge is three feet thick, and the whole averages \$25 to the ton.

## Nevada County.

From the *Transcript* of March 24th: Sixty-five tons of rock from the Wagoner ledge, recently worked at Palmer's mill, yielded \$2,275, being at the rate of \$35 per ton. This ledge is located on Piety Hill, and is owned by Sigourney, Hill & Co. The main tunnel is in 200 ft., and the rock crushed was taken out in prospecting. They are now about 75 ft. below the surface.

The incline on the Cunningham ledge is now in 170 ft. below the surface. At the old level, 100 ft. below the surface, a tunnel has been run, and a day or two since a splendid ledge 18 inches wide was struck.

Same of 27th: The Monadnock mine has been leased by its owners to McCarty and McDonald for two years. The parties will commence work immediately. The lead is supposed to be an extension of the Italian ledge.

From the *Gazette* of 21st: Our Omega correspondent gives these items: Harrington has resumed operations at Tecumseh. The Fidelity company are moving their house from the Tecumseh to the flat near the mill, and will commence work immediately on the Fidelity mine. The Marietta company (not Mary Etta) commonly known as the "Marvine mine," have been crushing rock in their new mill. They have just struck quartz in one of their tunnels that pays \$100 per ton. The mill is a new one, with hurdy gurdy wheel, and works splendidly.

Same of 25th: At the present time considerable quartz prospecting is going on in the foot hills, in the eastern part of Yuba and in Placer county. At Colfax a ledge has been opened called the Rising Sun, which gives promise of being a valuable mine, and the owners are now erecting a mill.

Same of 28th: The new mill of the Eagle company, on the California mine, is nearly completed, and will be started up for regular work some time this week.

From the Grass Valley *Union* of March 22d: The development of the O'Connor mine is progressing rapidly. Within the past 20 days, with a working force of two "shifts," 70 ft. have been run in the north-west drift, where the vein is steadily increasing in width. In the same period they have run 120 ft. in the southeast drift. In this drift the ledge now shows a width of 5 ft. between the walls, and the rock is of excellent quality.

A correspondent of the Dutch Flat *Enquirer* writes thus of Red Dog, March 23d: The blue gravel lead runs through Red Dog, and so on to Hunt's Hill (better known as "Gouge Eye") and Quaker Hill. Ed. Williams & Co. have a fine 12-stamp steam mill for crushing cement, and are taking out large quantities of gold. They are working 30 men, and are sure of having ground that will pay well for two years. Ennis & Co. have a 10-stamp water-power mill. This claim has been very successfully worked for about a year.

Wear & Garber are working the old Malory & Brothers' claim. This is the first blue gravel claim ever worked in Little York township, and has been "worked out" two or three times, but strange to say, is paying better than ever before.

The American company's claim, at Manzanita Hill, North San Juan, are now held at \$140,000. The gross income of the claims has amounted to \$105,000 per year for the last three years; but the expenses for water and working consume nearly half that amount, and leave for dividends on an average for the three years \$52,800 per year, or \$4,400 per month.

## Placer County.

From the *Herald* of March 23d: The crushing last week at the Harpending mine yielded 500 ounces of amalgam. Prof. Siliman is now on a visit to this mine.... The Ambruster claim, located on Georgia Hill, near Yankee Jim, was sold on Wednesday last to Dr. E. B. Harris for \$10,000.

Colfax letter to same:—Burnt Flat is bound to be a good mining camp. There are plenty of surface diggings that will pay from \$4 to \$8 per day to the hand when water is procured.... The Mountain View Quartz Lead is considered to be worth \$10,000 per share—four shares in the claim; Walker & Co., and Dillan & Co., are bringing in a ditch for the purpose of working other claims.... The mines about Kilmer's are proving to be rich. Some days as high as \$20 have been made to the hand.

McBride & Co., who found the 16-pound chunk at Bird's Valley, mentioned in our

last, found also another of 23 pounds. The *Stars and Stripes* says the yield of the first was over \$1,000, when panned up; the value of the other is not yet known.

A letter from Newcastle to the Grass Valley *Union* says: Capt. Mallet & Co., at the head of Badger Ravine, have erected a five-stamp mill, made one run, and had a good clean up. It paid so well that they have ordered five more stamps to be added to their mill, and they talk of putting up ten more soon. There is a large amount of unprospected cement gravel in this vicinity that will before long be worked by mill process.... Col. Hagen is making the first run with his ten-stamp Empire mill, crushing float rock.... The Kearsage Co., on the South side of Auburn Ravine, near Newcastle, are running a tunnel into their ledge, and are nearly in. The Buckeye Co., on the South side of Bald Hill, are sinking a shaft on their ledge, and have good prospects. They are down about 75 feet.

From the Dutch Flat *Enquirer* of March 20th:—The Messrs. King, having worked down upon their claim about fifty feet with the hydraulic process, struck a hard blue gravel, in which may be seen, in liberal quantities, free gold. The cement is exceedingly hard and requires crushing in order to obtain the gold. The owners have made arrangements to put up an eight-stamp mill.... The Iowa claim, just discovered, promises to pay at least \$15 per day to the hand.

Same of 23d:—The Lebanon company, at Prospect Hill, cleaned up thirty ounces after five days crushing. The Oriental mill, at Wisconsin Hill, started up on last Saturday to test the new machinery. It is said that the Rough and Ready company's mill at Grizzly Flat, has been purchased by parties from Dutch Flat, and is to be shipped immediately.

Letter to same from Colfax, March 19th, says:—A small vein of quartz, partially re-composed, was struck the other day in the street, by three who were digging a drain ditch. A pan was tried, and yielded two bits or more. "The news spread like wild fire, and the whole country was staked off in a few minutes."

## Plumas County.

From the *National* of March 9th: We learn that valuable diggings have lately been discovered near the head of Soda Creek, by Mr. Wilson Wall. It is reported that Mr. Wall obtained as high as \$50 per day with a rocker.

Judkins & Kellogg have broken a trail through the deep snow from the Cherokee ledge to the Round Valley mill, and are now hauling rock in sleighs for crushing. Bidwell & Co. are also hauling rock from the Caledonia ledge to their mill in Dixie Cañon. This rock is said to be quite rich. Rogers, Ferguson & Co. are engaged in running a tunnel to prospect the new diggings in North Cañon, between Round Valley and Greenville. The prospects are quite flattering.

The Quincy *Union* says that at the clean-up of Judkins & Kellogg's mill, they took out 200 ozs. for five days run. The Crescent & Whitney companies shipped to San Francisco \$6,100, the result of a week's run in their mills. The Crescent is running 22 and the Whitney 24 stamps.

## San Bernardino County.

From the *Guardian* of March 9th: Mr. Geo. E. Moore, the present proprietor of the Green lode, Holcomb Valley Dist., 38 miles east of this city, has caused the mine to be thoroughly prospected. He finds the vein to be from 2½ to 3 ft. wide, at the depth of 210 ft., and the rock to work from \$80 to \$100 per ton.... About six or eight miles distant from the Green lode, is the Olio, prospecting very well—about 80 feet down, and near it is the Mammoth, at about the same depth. Both lodes will prove profitable to the owners.... At the Cushman City mines, 10 miles east of Holcomb Valley, Messrs. John Searles, Dunn and Glassard are now taking out rock that prospects so rich, that it is their intention to ship it to San Francisco.

Near Marango Pass, some valuable copper mines have been discovered. Capt. Frink and party, from Los Angeles, are now prospecting them.

## Shasta County.

From the *Courier* of March 23d: C. F. Ellsworth has sold his real estate and mill property at South Fork, to the purchasers of the Chicago mine, for \$4,000.

The proprietors of the Eclectic claim, at South Fork, are sinking a shaft on the lode, and are finding just such rock as was found in the Chicago shaft at a similar depth.

We are informed that a conditional sale of the Crystal mine has been made to parties in San Francisco for \$35,000, the first installment of which has been paid.

We learn that Mr. Walsh is negotiating for the purchase of the battery of the Union

mill, at Lower Springs, with a view of removing it to South Fork.

Whittemore & Lanahan are engaged in opening a claim on one of the large flats on Clear Creek, below Horsetown, that will afford hydraulic diggings for a number of years.

The owners of the Highland mine, at French Gulch, have resumed work after a suspension of several months.

James Gerrard came down from Idaho last fall, and located a placer claim on Flat Creek. A few weeks ago he got fairly to work, since which time he has cleaned up from \$9 to 1 oz. every evening.

It is reported that Mr. Bryant, of San Francisco, has the refusal of the Ohio claim, in South Fork, at \$5 per foot.

## Sierra County.

From the Downville *Messenger* of March 23d: We learn that Rhodes & Co., who have a tunnel claim near Clement's saw mill, are taking out good pay.... Several new claims will be opened at Eureka in the spring.

## Siskiyou County.

From the Yreka *Union* of March 16th:—Messrs. McConaughy & Jenner are working an old claim at Etna, with encouraging prospects.

## Tuolumne County.

From the Sonora *Herald* of March 23d:—We understand that the proprietors of the "Tanzy" claim, situated east of this place, near the French Garden, have "struck it rich." The claim has just been opened, and the yield during the past week was averaged six ounces per day.

## Yuba County.

Letter from Bangor to the Marysville *Appeal* says:—The incline of the New North American Co. is down 70 feet. Young & Co. are getting along finely with their shaft. Bassett, Smith & Co. have a fine prospect. They are on the bed-rock, and have a drift run 125 ft. on the rock. They have now stopped for repairs, and to put in a heavier engine. This lead is on the Smartsville range, and can be plainly traced.

The *Appeal* of 26th says: The Rare Rippe Co., Brown's Valley, will erect an eight-stamp mill.

A number of quartz claims have been located near the Round Flat House.

## ARIZONA.

From the San Bernardino *Guardian* of Feb. 23d: We learn that the Moss lead is now in first-rate condition. There is on the road machinery for the working of the ore, which continues rich and abundant.

We hear that Mr. Hardy is about to put up a mill for working his mine, in the Sacramento Dist., on the Colorado river. The mill is to be at Hardyville. There are about 500 tons of rock on hand ready for crushing.

Mr. Thompson, of the Great Central company, sent down to the mouth of the river, for shipment to San Francisco, 20,000 lbs of copper, which had been smelted at the works of the company.... Martin & Co. of New York have erected extensive smelting works.

Prescott letter to same, says: The is something doing in placer mining, on the Haysayampa and Lynx Creek, and many persons have gone to a section of country about sixty miles in a southeasterly course from here, where, it is reported, good placer mines have been found. Some work has been done on the lode mines. John Laughlin is at work on the Orion bolt, which is looking well.

Letter from Hardyville to the Wilmington *Journal* of March 16th: The Moss Mine Quartz mill will commence crushing the Michigan mine ore next week. About 100 tons of rock are now at the mill. Mr. Hardy is prosecuting work on the Parson's lode, I think he will soon develop a rich mine.

## IDAHO.

From the Lewiston *Journal* of March 1st: The mining on the hars of Salmon River, has been to a great extent confined to rocker work, paying from \$3 to \$8 per day to the hand. But now ditches and flumes are being constructed to carry the water of the small tributaries of the river to the higher benches and bars, which offer sufficient ground for years of steady mining. About one-half mile below the White Bird trail are the Casaboule claims which employ six men averaging \$8 per day, per man. Four miles below this are the claims of Antoine Letalic, employing 15 men, and averaging from \$8 to \$15 per day to the hand. About one mile below this, are the Napoleon claims, worked with hydraulic power, which have yielded regularly for upwards of four years past a good profit upon the labor expended. Two miles further down the river, are the Pon's claims, employing 11 men who are averaging from \$10 to \$15 per day per man. There are still several other companies at work with creek water on different points of the river banks, between John Day Creek and

Long Bar. Among them is Chas. Snyder & Co., four men making \$8 per day per man. Besides the companies we have named, there are upwards of 100 men working with rockers along the river, between Long bar and French Creek, whose daily average for working time is from \$2 to \$8. From Long Bar to the mouth of the river, we are told that about 75 men are profitably employed. One company from Warren's went on the bars of South Salmon in August last, and remained till November, and averaged each over \$20 per day during their stay there.

At the Palouse mines, the Chinamen have bought the Kelly claims and paid the cash down, and are negotiating for the Colerick claim, which is held at \$5,000. The Franklin Co. are at work about a mile and a half from Gnat Creek and making an average of \$10 a day to the hand. The Peterson Co. is located on what is called Big Creek, and has good \$8 diggings.

From the Boise City Statesman of March 9th: From the Atlanta, Yuha Dist., Middle Boise, the DeFrees Co. are taking rock which is very rich, and a portion of it will equal in richness the best rock ever taken from the Poorman of Owyhee. The ledge is 22 ft. wide at a depth of 90 ft., and the average pay of the entire ledge is computed at \$75 per ton. Two hundred ft. in the 4th east extension, sold for \$10 per ft. in gold coin. The Luey Phillips ledge is owned by Messrs. Massheco, Graham & Co. They have struck a splendid ledge, containing some very rich silver ore. The Eclipse Discovery is owned by the same company, and a tunnel has been run this winter, striking the ledge at a depth of 150 ft. from the surface. The ledge is over nine ft. wide and rich. The 1st extension on the Eclipse ledge is owned by Messrs. Richard Thomas & Co. They have nine ft. solid ledge of rich paying ore. The Gray Eagle is owned by Williams, Stevens & Co. They are sinking a shaft on a 16-ft. ledge and getting very fine rock. They are down some 90 ft. The Hard Times is owned by Col. J. W. O'Neil, and has been prospected with tunnels. The Colonel is about starting from San Francisco with a 20-stamp mill.

From the *Avalanche* of March 16th: The deed of transfer to 133½ ft. in the Empire ledge is to be made to-day. Price per foot, \$15. Last week a sale was made of the same amount in the same ledge. It is situated on War Eagle Mountain to the east of the Poorman.

In the Dashaway the main shaft is down 70 ft. The vein is four ft. in thickness, and rich.

The Black Bros. have been for the last three weeks engaged in grading a place to build their furnaces, and would, but for the frost, soon be prepared to start the whistle. The mill is entirely completed and in running order, lacking only the completion of the roasting furnaces.

In Flint Dist., the Sherman discovery tunnel is about 75 ft. in. Another tunnel is being run on the second extension north. They are in about 90 ft. Messrs. Scott & Carter have commenced a tunnel on the first south extension, and expect to strike the ledge in 50 ft. Messrs. Warnke & Swart, who commenced a tunnel on the first extension south of the Leviathan about a year ago, struck the ledge recently. The ledge is fully four feet between the walls, filled with very rich quartz.

From the *World's Pioneer City* correspondence: Forty-five miles due north from here is Deadwood Basin. There are six men there this winter. Snow eight ft. deep. The diggings pay from \$8 to \$10 per day. Sifers & Wright struck the ledge in their lower tunnel on the Big Muddy, eight feet wide. Work at Elk Horn is progressing. They have found one of the ledges 3½ ft. wide, and worth \$30 to the ton.

#### MONTANA.

From the *Post* of March 9th: The Hawk-eye mill (Postlewaite's) made another seven days' run, and cleaned up on Sunday morning 362½ ozs., valued at \$6,525 in gold. This is the best run ever made in Madison county. The ore was taken from discovery claim on the Kearsage lode.

Prof. Deidsheimer, now in charge of the St. Louis and Montana smelting works, at Argenta, Prof. Steitz being still sick, finished the first run last Thursday, and turned over to the proprietors a block of silver weighing 90 lbs., as the yield of less than 4,000 lbs. of "rich lead," and the result of 1½ days' run. The silver extracted is .995 pure, and at the rate of \$16.30 per lb., foot up \$1,467. The ore was taken from the Legal Tender lode.

At Sterling, Prof. Ward has 60 men employed in developing leads. The Housel lead, in Norwegian Gulch, is said to be the richest lead yet discovered. It has a 3-ft. crevice. Clark's mill will be in running order by April 1st. Cope is still at work on the Pony and Galena leads, and is also tak-

ing out rock from the Blue for the next run. Atkin's mill on Meadow Creek is nearly completed.

In Flint Creek Dist., the "P. G." lode has a crevice 20 inches wide, with one shaft on it 16 ft. deep, and they are sinking another which they expect will strike the lead at a depth of 60 ft. From this lode we have seen specimens of rock containing pure native silver, not scattered over it in fine particles, but laid on thick, somewhat resembling an old-fashioned piece of bread and butter—more hutter than bread. An assay of ore from this lode shows \$2,902 per ton.

Letter to same from Elk Creek, says: In the lower portion of the gulch, three large companies have been to the expense of putting in bedrock flumes.

Bear Gulch is deep, and the claims therein are mostly drifting claims. Some do not require drainage. In some of these remunerative labor was going on all last summer and fall, and during this winter when practicable. Many bars and points have been worked and have paid well. One ounce per day to the man is not unusual. Miners are busy in the neighborhood of Bear Town.

Helena news: The new Eagle Creek Gulch they say prospects very well. Between fifteen and twenty shafts have been sunk in the gulch, up to the present time, as we learn from a gentleman just in from there, with flattering results. It is from 15 to 20 ft. to the bedrock, and the "pay dirt" is from 3 to 5 ft. deep, which prospects as high as \$2.50 to the pan.

#### NEVADA.

##### Esmeralda.

From the *Aurora Union* of March 16th: We have been informed that Mr. Wheeler, of Pine Grove, had 11 tons of ore from his claim worked in an arrastra, which paid \$50 per ton, and feels satisfied that not more than one-half of the gold was saved.

Letter to same from Pino Grove, Wilson Dist., says: There has been one clean-up at the mill, and 66 tons of Wilson's quartz yielded at the rate of \$40 per ton, or \$2,640. Important discoveries are being made between this place and Aurora. Croppings and indications are of the most favorable character.

The *Virginia Enterprise* of March 18th, also contains a letter from the same district, with these items: The 10-stamp mill owned by Capt. Pray, Gov. Blasdel and others, commenced crushing rock on March 5th for Mr. Wilson. Out of a run of 60 tons of rock, which had been culled and picked over for specimens, it cleaned up about \$3,000. The mill works admirably. The arrastras have been running but a short time, yet they have already shipped about \$1,000 worth of bullion. They have been crushing rock from the Wheeler and the Central. The gold here is very fine, it will assay \$18.50 per ounce.

##### Humboldt.

From the *Register* of March 16th: Mr. Torrey is progressing rapidly with his furnaces. He has a most convenient location, about a mile below Etna, and in three or four weeks will have his furnaces in full blast. He has 500 tons of ore out, and has a large force at work in his mines, and expects to keep his furnaces running day and night all summer.

Sixty pounds of ore lately taken from the Monroe mine, in Sierra Dist., and worked in a mortar, yielded \$362.80, or at the rate of a little over \$12,000 per ton in gold.

The Humboldt River company has purchased the Munroe mine near Dun Glen. A mill will be erected at once.

Mr. Sanchez, an old Mexican miner, has found a quartz ledge 200 ft. wide on the top, and in some places cropping out to the height of 100 ft. It is in the foot-hills east of Humboldt Lake. He has named it the Esperanza.

The New mines are located in Big Meadow Dist., 13 miles below Oreana, and two miles west of the line of the Pacific Railroad. All with whom we have conversed, who have visited these mines, speak well of them.

The Nevada Star company continues to press its work, with a full set of hands, day and night.

##### Reese River.

From the *Reveille* of March 16th: This morning, nine bars of bullion, valued at \$8,213.67, were brought into town from Silver Bend. They are the product of ore from Col. Buel's Highbridge, which was reduced at his mill at Belmont.

We have encouraging news from Reveille Dist. The Highbridge has 4 ft. of ore, with perfectly smooth casings. A mill is to be put up on the Scorpion. A large ledge has been recently discovered near the northern boundary of the district. It is 8 or 10 feet wide, and will, it is estimated, pay \$120 per ton. The Rutland mill is nearly ready to go into operation.

The Manhattan company is working at present the ore from its North Star mine,

which is of a high grade. The large lots worked during the month of February, and up to the middle of the present month, averaged \$240 per ton. Within the past few days a much better class of ore has been developed towards the end of the western level of the mine.

Same of 18th: Some of the practical results at Silver Bend are as follows: Colonel Buel put up his mill last September. Up to the middle of the present month there had been extracted from the Highbridge 1,000 tons of ore, which were reduced at the mill at Belmont, and yielded \$100,000. The whole of this ore was procured from the depth of 80 ft. The Transylvania No. 1 has been opened to the depth of 25 ft., and 15 tons of its ore have been worked with a yield of \$300 per ton. The Silver Bend company and the Combination company will each erect a powerful mill during the coming season.

Same of 19th: The Florida made its report for the month of February yesterday. Fifty-two tons of ore yielded 20 bars, valued at over \$20,000. Several small lots of chloride ore from Lander and Central hills, recently worked at the Keystone mill, yielded from \$250 to \$350 per ton.

Same of 20th: One ton of ore from the Summit Queen ledge, in Reveille District, yielded a bar of bullion valued at \$362.14. Nine bars, worth \$7,500, came in yesterday from the Twin River company's mill, at Ophir Cañon. By yesterday's stage 3,412 ozs. of crude bullion arrived from the mill of the Social and Steptoe company at Egan Cañon. The bullion contains about five per cent. of gold. The Harvard company has a vertical shaft 100 ft. deep on the Josephine ledge. The Bullion company have out a lot of good ore from the Fisherman ledge, which will be hauled to Austin for reduction. The work of transferring the 10-stamp mill of the Confidence company from Yankee Blado to the ground of the Twin Ophir company in Park Cañon is progressing.

##### Washoe.

[In the Stock Circular, in another portion of this paper, will be found late mining news from this district.]

From the *Territorial Enterprise* of March 19th: A neat 30-oz. bar, containing—gold, \$44.15; silver, \$35.72—total, 79.87—was the product of two tons of ore from the Mount Blanc mine, just worked at Rigby's mill, taken without selection from the front ledge, 250 ft. from the mouth of the tunnel.

From same of 22d: Peter O'Reilly, well known as the man who, with Patrick McLaughlin, first uncovered the Comstock ledge at the point where the first rich sulphurets were found in the Ophir mine, has struck it again. The lead is situated below Carson City, on or near what is known as the Cradlebaugh Bridge road, in a group of low hills lying between Carson River and the foot of the Sierras. "Pete" ran a tunnel 60 ft. into a hill, where there was no sign of a ledge on the surface, and struck one showing rock, which yielded by mill process, at Silver City, \$18.50 per ton.

Same of 23d: A brick worth \$2,166.84, was the product of ore from the Occidental, a mine about a mile and a half from the Comstock, in the direction of Dayton.

The Eclipse Mining company, Gold Hill, are taking out a considerable amount of surface ore of a good quality, as is also the case at the Trench claim.

The combined shipments of Gold Hill and Virginia for the week ending yesterday, were 8 tons and 219 lbs., worth \$464,755.55—almost half a million dollars.

From the *Trespass* of March 19th: The Challenge Hoisting Works, Gold Hill, idle ever since the commencement of the storm, resumed work yesterday.

The Plato and Bowers companies, Gold Hill, are at work building a new dump with the patent discharge flues. It will be a great improvement on the former facilities for loading. A wagon can load and stand from under in five minutes from the time the gate is opened.

Same of 21st: Frank Denver, the contractor, has commenced work upon the Hoosier State mill, with a force sufficient to insure its completion in thirty days. The building is to be increased in size, and another battery of 10 stamps added. When finished, the mill will have 18 stamps, be capable of reducing 40 tons of ore daily, and be one of the best constructed mills in the county.

From the *Gold Hill News* of March 18th: A brick worth \$11,309.09 was the product of ore worked at the Piute mill the other day.

On Saturday we visited the Crown Point, Kentucky, and South Yellow Jacket. The ore from each of these mines is as good as ever has been taken from them at any time since they were first opened.

Same of 21st: We understand that there is a large body of good surface ore in the Alpha. Parties are running an incline. There is no change in the Bullion mine. There is not a mine in the State where there has been more work done without obtaining any ore as a set off against expenses, than in the Bullion mine.

Same of 23d: The new shaft of the Hale & Norcross company is further east than any other on the Comstock, being nearly or quite one-fourth of a mile east of the old works of the company. The ledge will not be struck by a perpendicular shaft in less than 200 ft., and perhaps not short of 300 ft. Since work was started it has never stopped an hour. The total cost of the improvements now being made will be nearly half a million of dollars.

#### OCEAN IRON CLIPPERS.—The iron clipper

ship *British Consul* arrived here a few days ago from Liverpool. She is the pioneer in a line of first-class ships of the kind which is intended to run between San Francisco and that port—projected by W. MacCann, a pioneer San Franciscan, and owned by the British Ship Owners' Company. This vessel is constructed wholly of iron, even to the masts and yards. Her dimensions (excluding fractions) are as follows: Length, 214 feet; breadth of beam, 36 feet; depth of hold, 22 feet. Her tonnage is 1,206 tons. She is spoken of as the handsomest English vessel that ever entered the Golden Gate. Every improvement that the ship-builder's art can boast has been, in her case, adopted. Fourteen of these ships will constitute the fleet of the line. The object of the enterprise is to obtain a share in the trade in fine goods from France and other European countries, which goods now come by way of Panama, at a freight of sixty or seventy dollars per ton. By this new line the freight will be reduced to sixteen dollars.

Mr. MacCann, the projector of this line, will be the Liverpool agent, and will be correspondent of the San Francisco Chamber of Commerce. Below we give the card in which this announcement is made:

CHAMBER OF COMMERCE, SAN FRANCISCO, CAL.,  
February 23d, 1867.

#### To whom it may concern:

This is to certify that Mr. Wm. MacCann was, on the 12th day of February, 1867, duly appointed by the Chamber of Commerce of San Francisco, Resident Correspondent of the Chamber for Liverpool, England.

The special object of Mr. MacCann's appointment and the creation of the position, is for the more thorough dissemination, throughout Europe, of information in regard to the resources of California, that immigration may be encouraged and mankind benefited.

Mr. MacCann's distinguished services in the matter of our mercantile marine, together with the high state of improvement brought about in that department through his efforts, makes his appointment peculiarly appropriate. Most respectfully,

[Signed,] RICHARD G. SNEATH, Pres't.  
Attest: WM. R. WADSWORTH, Sec'y.

Mr. MacCann commenced his efforts in this direction in 1863. He is now in this city, but goes forward at once to assume the duties of his office.

PACIFIC RAILROAD.—A New York telegram of March 22d, says that a 300-mile section of this road is let, and to be completed in 100 days from May 1st. There will then be a continuous line of railway from New York to the mining region of Colorado Territory; leaving only about 900 miles to complete the chain linking ocean to ocean.

The leaves of the pine-apple plant produce a fibrous material known and appreciated by the barbarous hordes of Africa and the semi-civilized Malays. The celebrated pine-apple cloth of the Philippines, resembling the finest muslin, is woven with the delicate fibers of the uncultivated pine-apple plant. This muslin is embroidered by the nuns of the convents of Manila with excellent skill and taste, so that the "pina" muslin of the Philippines has become a celebrated article of manufacture.

MARBLE IN PLACER.—J. R. Brown found a marble quarry the other day, five miles north of Auburn, Placer county.

## Mining and Scientific Press.

W. B. EWER,.....SENIOR EDITOR.

One copy, six months, in advance,..... 3 00  
For sale by Carriers and Newsdealers.—25

**American and Foreign Patents.**—Letters Patent for Inventors can be secured in the United States and foreign countries through the Mining and Scientific Press Patent Agency. We offer applicants reasonable terms, and they can rest assured of a strict compliance with our obligations, and a faithful performance of all contracts. For reference, we will furnish the names of numerous parties for whom we have obtained patents during the past two years.

## Canvassing Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting our Agents in their labors of canvassing, by lending their influence and encouraging favors. We shall send none but worthy men.

Mr. A. C. KNOX, is our city soliciting and collecting Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office.

Mr. L. W. Feltton, is an authorized agent for this paper, San Francisco, Jan 11th, 1866.

Mr. E. L. Smith, is a duly authorized agent for this paper, Portland, Oregon, Dec. 1, 1865.

Mr. Geo. F. Bates is a duly authorized agent for the Mining and Scientific Press, March 23, 1867.

Mr. J. M. Quay will act as agent for the Mining and Scientific Press from this date. March 23, 1867.

SUBSCRIBERS who do not receive the Mining and Scientific Press in due time, are requested to inform the publishers

## San Francisco:

Saturday Morning, March 30, 1867.

**MECHANICS' INSTITUTE.**—The new building was inaugurated on the evening of Tuesday, the 26th inst. A display of fireworks was made from the front of the building, before the exercises of the evening commenced. At 8 o'clock, the Hall on the first floor, which was gaily decorated with festoons of flowers and streamers, was filled with the invited guests; the Board of Supervisors, Judiciary and Navy Officers, and a large number of ladies, being among them. Rev. H. Stebbins opened with prayer. H. F. Williams read a paper, which gave a history in brief of the Institute from its inception to the present time. Hon. Nathan Porter delivered the Inaugural Address. Although extemporaneous, it was evidently not a carelessly prepared effort, and was worthy of the occasion. A good point made, was, that all scientific advance was dependent upon the artisan. Without his aid in the fashioning of instruments and apparatus, natural sciences of any kind could make no distinctly defined step forward. He believed, too, that the future glory of that nation which was to link, by railroads, Patagonia with Sitka, was in the hands of its educated mechanics.

The Poem, written for the occasion by Frank Soule, was, owing to the indisposition of the author, read by Prof. Knowlton, by particular request. It was entitled "Labor and Wealth." We give the first line, which, in itself, gives a complete and perfect idea of the whole:

"Who sings of Labor, sings of Wealth."

Parts of the Poem were very well read, and it was listened to with the greatest attention by every individual in that crowded audience. The exercises being concluded, another display of fireworks took place—this time by Messrs. Church & Clarke.

We shall not attempt in the present notice to do justice to the elegant rooms of the Institute, in a description which would be, perforce, brief. Suffice it to say, that they reflect the greatest credit upon their designers and arrangers. As we walked through them, we could not but feel that the lot of the citizen in this favored land is infinitely more enviable than that of the nobleman in any other. The true sovereign is the mechanic. Cotton no longer, but Iron, is king!

**HAZARD'S POWDER.**—Mr. E. H. Parker, No. 224 California street, has been agent for this powder, for this coast, during the last fifteen years. It is made of the best material, and has always been a favorite brand with both the mining and sporting community. The company intend to keep their agent well supplied and to maintain the past reputation of its powder.

## Difficulties in the Chlorination Process.

Much difficulty is often encountered in the chlorination process, in obtaining along with the gold a large precipitate of chloride of magnesium and lime. These minerals have long been known to have a greater affinity for chlorine than the gold itself; and consequently when they occur in large quantities, in the sulphurets, they involve the necessity for the use of a much larger amount of chlorine than usual; so much so as to add seriously to the cost of the process, aside from the annoyance of separating the products after the precipitate has been obtained. This difficulty has, doubtless, in some instances occurred where its true nature was not understood, and has resulted in great loss of gold. Perhaps there may be cases where sulphurets containing magnesium or lime have been submitted to a test process of chlorination, and have been pronounced as too poor to work. We have heard of one or two such cases, where much expense and delay have been incurred by our mine owners in consequence. In the instances alluded to, however, the true nature of the difficulty has since been learned, and the proper remedy applied.

The remedy is simple, cheap and efficient. Whenever sulphurets are to be submitted to this process, they should always be first examined for magnesium or lime; and if found to contain either, all that is required is simply to convert the magnesium and lime into a chloride, in the furnace, by the addition of salt (chloride of sodium)—proportioned to the quantity of magnesium or lime present—at the proper time. It will then go into the chlorination vat as a chloride, in which condition it is not taken up by the gas, and consequently does not interfere with the action of the chlorine on the gold. But if it goes into the vat as a carbonate (which it will do without the use of salt in the furnace), it takes up the chlorine so readily as to prevent the proper action of that gas on the gold—hence, the loss and trouble alluded to. Miners will do well to bear this fact in mind, as it may seriously interfere with the yield of their sulphurets, where they are subjected to the chlorination process, without due precaution as above.

**TREATMENT OF SULPHURETS.**—The Amador Ledger appears to be still in doubt with regard to the possibility of the successful working of auriferous sulphurets in California. We again assure our contemporary, most positively, that there is no portion of the globe in which such ores can be worked closer or more scientifically than in California. If the mines of Amador have sulphurets that will pay anything like the amount claimed by the Ledger, there will be no difficulty in having them worked in this city, or in finding persons here who can treat them successfully on the ground. Buyers can be found in San Francisco for all sulphurets that will assay from \$75 to \$100 to the ton, at prices that will well repay to save and transport them hither.

**THE SAN FRANCISCO GLASS WORKS.**—This important establishment, having just been subjected to extensive repairs, is now again in operation, and ready to receive orders for every description of hollow glass ware, such as German flint, prescription, vials, lamp chimneys, brandy and wine bottles, soda bottles, chemical ware, etc., etc. This branch of our home manufactures is becoming one of large importance, and is almost indispensable to numerous branches of business on this coast. As such its productions should always be selected in preference to those of eastern or foreign manufacture. See their advertisement in another column.

**PATENT OFFICE REPORT.**—We acknowledge the receipt of two copies of this report for 1862, from our Representative in Congress, Hon. D. C. McRuer.

## Mining Experiments.

An unusual degree of attention is being directed at this time, throughout the Pacific Coast, to thorough and economical methods of roasting or desulphurizing ores; especially those containing gold and silver. The great cost involved in the construction and operation of the ordinary reverberatory furnace, and the limited extent of sulphurets requiring furnace treatment, usually found in any given locality, renders a thorough inquiry into this matter a thing of especial interest here. In the absence of any governmental establishment where experiments should be undertaken at public expense, for the benefit of the public, each person or company in this country is compelled to institute experiments at his own cost; hence, the necessity that experiments, whenever conducted, should be reported for the general benefit of all. There is one serious drawback, however, inseparable from this mode of obtaining information—the difficulty of procuring correct data.

The value of the report of an experiment depends upon its accuracy, and the minuteness of the detail. Unfortunately private experimenters are very seldom sufficiently careful in this particular, and the reporter is therefore unable to communicate results which will be altogether satisfactory. Such is particularly the case with the Brown's Valley experiments, which we gave in our issue of the 16th instant, and which are reviewed in another column of to-day's issue. Of course all such experiments can only be suggestive—they do not afford data for definite conclusions. The above remarks are also, to a certain extent, applicable to the furnace experiment which we now propose to give, and which our readers must take as they find it.

It is well known to most of our readers that Mr. Mosheimer has established a plant of metallurgical works at the North Beach, where he is engaged in working ores, in an experimental way, for such parties in the interior as may desire to have their ores so tested. Mr. M. has paid considerable attention to the various methods of roasting the ores submitted to him for treatment, and in so doing has used several different kinds of processes. The last which he has tried is an improvement of his own, which he calls

## THE UPRIGHT OR SHELF FURNACE,

In connection with a reverberatory. This furnace consists of an upright stack or chimney, from twelve to fifteen feet high, and three by four feet of interior sectional area. The two narrowest walls—three feet—are built up with shelves, two feet apart, and so arranged that the shelves on the opposite walls break joints, and overlap each other about eighteen inches. The arrangement of the shelves would consequently be represented by the following diagram:

A 15-foot furnace would consist of fifteen shelves. The feed is at the opening on the top. Just over each shelf is a small opening through which the operator can introduce a proper instrument to throw the sulphurets from one shelf to the next below, and so on to the bottom. This gradual movement of the mass, from top to bottom, answers the place of stirring. The bottom of the furnace consists of a reverberatory hearth, upon which the ore falls for its final and complete roasting. While the ore is

passing over the five or six lower shelves, it may be subjected to the action of a small jet of steam, which is introduced by means of proper pipes. We are assured by Mr. Mosheimer, that he is able to reduce his sulphurets in this furnace in about one-quarter of the time required by the reverberatory alone. The economy of fuel must be apparent to any one; and we are assured that thus far it has required less than one-half as much as the ordinary reverberatory. The attention necessary is not only much less than in the reverberatory, but it is much lighter, and may be safely entrusted to a boy; while in the old way an experienced and trustful man is required. Mr. Maltman, who is proprietor of chlorination works in both Nevada and Grass Valley, is now putting up one of these furnaces to take the place of his reverberatory; having been satisfied, after a careful inspection of the one at Mr. Mosheimer's works, that there is economy in it. The cost of such a furnace is not more than half that of a reverberatory, to do the same work. The difference in cost is saved by being able to do the same work with a reverberatory of 500 pounds capacity, which, without the upright shelf-stack, would require a reverberatory of 2,000 pounds capacity. The heat produced by the burning of the sulphur, is utilized in the upright or shelf-stack.

**PERSONAL.**—Among the strangers now sojourning in this city, we would particularly mention the name of Capt. J. R. Caldbeck, F. R. G. S., who has been for many years prominently connected with the Peninsular and Oriental Steam Navigation Co., most of the time in command of some one vessel of the fleet. Capt. Caldbeck—who, by the way, is a near relative of our Commissioner for the collection of mining statistics—arrived in this city by the Golden City, and will leave on Wednesday next, by the Colorado, en route for Singapore, where he will remain as resident manager of the Company's interest at that port. The Captain has taken a particular interest in the study and development of the condition and resources of the Pacific Coast of America—having, some two years ago, been sent out as Commissioner by some of the leading merchants and bankers of London, with the view of establishing more extensive steam communication between England and the ports of the Pacific. Having discharged the duties of that commission, he is now, as already observed, on his way to Eastern China, in the employ of the Company he has so long and so faithfully served in various positions of honor and trust.

We have every reason to believe that the Directors of that Company—whose headquarters are at 122 Leadenhall street, London—look with much favor upon the American steamship line just initiated between this port and China and Japan. They take a truly liberal and comprehensive view of the enterprise, and have no idea that it will in any way injuriously affect their own interests, but on the contrary, that it will result in establishing more intimate and more extensive commercial relations between the great centers of Asiatic populations and the Anglo-Saxon peoples of Europe and America, whereby their own Company, as well as the world at large, will be greatly benefited. Such improved commercial facilities cannot fail to add a great impetus to the travel and traffic between those opposite quarters of the globe. While we look for grand results to accrue to our own people and State from the pushing energy and popular prestige of Americans among the more facile peoples of China and Japan, we trust our English friends will never have occasion to look upon our growing interests there in any other light than that of friendly co-workers in the great work of elevating and bringing to the full standard of European civilization the countless millions of Oriental Asia.

**A PIONEER PROSPECTOR.**—J. M. Kirkpatrick, has shown us a splendid specimen of Rocky Mountain gold, weighing seven ounces four pennyweights, (value about \$128, being worth over \$18 per ounce.) It was taken from gold diggings in Montana, near head waters of Elk Creek, within 900 feet of the summit of the Rocky Mountain range. Mr. Kirkpatrick is one of the original discoverers of the famous Poorman lode, Owyhee, and has proven one of our most efficient prospectors. He intends this summer to start out on an exploring expedition through the district ranging above Fort Tejon. Mr. Kirkpatrick will only have a small party of working prospectors. He is thoroughly acquainted with the Indian ways and with their language, and prefers to go into their country with a few men of the right kind, rather than with a large and unmanageable crowd of those who are unacquainted with frontier life. It has become a maxim that large parties make small discoveries.

It is to such hardy prospectors as Mr. K. that we are indebted for the opening up of our resources. They take the initial steps, and lay out the work for those who come after. Restless spirits, they find their reward in the constant excitement of adventure; rarely laying up for themselves the gold and silver treasures which they point out to others.

**MANUFACTURE OF JEWELRY BOXES, ETC.** Very few, except jewelers, confectioners, and some others who deal in certain kinds of small fancy articles, are aware, perhaps, even of the existence of an establishment in this city for the manufacture from velvet, silk, morocco, and paper, of a certain class of goods, such as pocket-books, portfolios, boxes for silver sets, etc., etc.; much less of the number, variety and value of the products turned out from the same during the past ten years. Mr. Breidestien, the proprietor, whose rooms are at No. 652 Washington street, called our attention to a delicate little instrument for cleaning the glasses of spectacles, which seemed so much better suited for the purpose than one corner of a silk handkerchief, that a brief description may not be amiss. Two little circular pads stuffed with cotton and covered with chamois skin, are attached to the end of the arms of a zinc spring, which brings the faces of the pads gently together, when pressed by the hand. The glasses are inserted between the pads and cleaned effectually, almost by a single turn of the instrument.

**AGRICULTURAL IMPROVEMENTS, ETC.**—All interested in the development of the mining and agricultural interests of the coast, will be pleased to learn that Messrs. Baker & Hamilton, one of the oldest and most popular firms of Sacramento, and for many years known as extensive importers and dealers in engines, hardware, agricultural and other implements, have just opened a similar establishment in the large new structure, known as Yankee Block, on Front street, between Pine and Market. A fine cut of Wood & Mann's portable engines appears to-day, but too late to receive that attention we hope to give it hereafter.

**THE OAKLAND COTTON FACTORY.**—It was announced, some months since, that Mr. Rector, of the Oakland Cotton Factory, was making arrangements to introduce woolen, in addition to cotton machinery. The new machinery was received about three months since, and has just been put in operation. It is not the intention to make all wool goods, but only the mixed goods, known as "jeans." These goods, of our own manufacture, will soon be in the market.

**CALIFORNIA BLACKING.**—Messrs. Korn & Hawkins, "Sole manufacturers, San Francisco," have shown us a sample of this article made by them. They intend to turn out, not only Paste Blacking, but a liquid ditto, which will take the "shine" out of every thing else of the kind.

## BAKER & HAMILTON, IMPORTERS AND DEALERS IN Agricultural Implements, Portable Steam Engines, Hardware, RUBBER BELTING, Etc., Etc.

Nos. 17 and 19 Front street, San Francisco, and 9, 11, 13 and 15 J street, Sacramento.

### Wood & Mann's Portable Steam Engines, 6, 8, 10, 12 and 15 horse power,

With newly invented Water Bottom, which entirely surrounds the fire, grate and ash-pit, forming underneath the ash-pit, as up the sides of the furnace, a three or four inch water space, by which additional heating surface is obtained, the accumulation of sediment around the fire-box or furnace is entirely prevented and renders it perfectly safe to use near any barn, or in any farm yard, or in any building where a stove would be allowed, as no sparks can possibly escape from the furnace or ash-pit. The sediment has a free passage to the bottom of the fire box, and can be blown off daily by the blow off cock underneath the ash-pit, by which means the Boilers may be kept clean much longer than under the old system. The great saving in repairs which is effected by the use of these water bottom, and the constantly increasing demand for them, prove their superiority to any others yet constructed.

### Hoadley's Thrashing Engines.

### HITTINGER & RAWSON'S IMPROVED HOISTING ENGINES, 6, 8, 12 & 20-horse power.

### A. S. Hallidie & Co.,

MANUFACTURERS OF

### FLAT & ROUND WIRE ROPE,

For Mining, Shipping, Ferry,  
AND GENERAL PURPOSES.

Office—412 Clay street. Works—North Beach

**NOTICE.**—THE FIRST COST OF WIRE ROPE IS MUCH less than that of any other kind of Rope of equal strength, and it is four times as durable. Wire Rope does not stretch or shrink by atmospheric changes; it has but one-fifth the bulk of Hemp Rope; is spliced and repaired in the same manner.

The attention of Mining Companies is particularly called to our Flat and Round Hoisting Ropes, which have been in use for a number of years by the leading mines on this Coast, and to any of whom we refer those interested as to the great advantages over any other kind of rope, effecting an immense saving in expenditure for ropes, fuel, wear and tear of machinery, stoppage of works, etc., besides increasing safety of life.

Mining Companies, in erecting Hoisting Works, should be sure and have their drums and pulleys of sufficient size, whether for wire or hemp rope.

We manufacture of all sizes, and in any length—

Round Wire Rope—Iron or Steel, for Hoisting.

Flat Wire Rope—

Soft Steel Wire Rope—For Derrick Fall Ropes—very strong and durable—one third the weight of hemp of equal strength, (saving in freight for remote localities). Suitable sheaves and blocks furnished when required.

Galvanized or Ungalvanized Round Wire Rope—For Ships' Rigging, Derrick Gays, Ferry Ropes, and all standing purposes.

Steel Ferry Ropes—For wide streams. Ferry Blocks supplied.

Iron and Copper Wire Cord— $\frac{1}{2}$  to  $\frac{1}{4}$ -inch diameter, for hanging window shades; Signal Cord; Sash Pulleys on hand.

Comparative Weight, Size and Strength of Iron Wire Rope, Steel Wire Rope, Hemp Rope, and Chain.

Iron Wire Rope.	Steel Wire Rope.	Hemp Rope.	Chain.	Equivalent Strength.

Pamphlets containing data, with prices annexed, forwarded free, by mail or express, on application to manufacturers. 25v13:6mp

Established in 1849--Corner First and Mission streets, San Francisco.

HAVING INCREASED OUR FACILITIES IN EVERY DEPARTMENT, WE ARE NOW prepared at the shortest notice and at the most reasonable rates, to furnish all kinds and description of Machinery, including Steam Engines, Quartz Mills, Mining Pumps of all kinds, Hoisting Gear, Gas Work, Laundry Machinery, Architectural and Ornamental Castings, Sugar Mills, Saw and Flour Mills, Water Wheels of all kind, Hydraulic, Hay, Rags, screw and Drop Presses, Coining Machinery, Pile Drivers, Bark and Malt Mills, and all kinds of Castings.

**ENGINES.**—Marine Engines, Oscillating and Beam, Stern and Side Wheel Boats, Locomotives, Stationary Engines, Horizontal, Upright, Oscillating and Beam, from six to fifty inches diameter. Also, Scott & Eckart's Adjustable Cut-off Regulator—best in use; W. R. Eckart's Balance Valve for Stationary Engines; Woodward's Patent Steam Pump and Fire Engine.

**BOILERS.**—Locomotive, Flue, Tubular, Upright, Cylinder and Cornish, and every variety of Boiler Work. All sizes of tubes and pipes for pumps.

**PUMPS.**—The Excelsior double-acting Force pumps are manufactured by us. These very superior pumps are warranted the best, and are fast replacing all other Force Pumps.

**AMALGAMATING MACHINERY.**—Wheeler & Randall's Improved Tractory Curve Pan, Zenus Wheeler's Improved flat bottom pan, Beldin's pan, Veatch's tubs, Prater's concentrators, Waklee's pans, Beck's pan, German Barrels, Astra Gearing, Chile Mills, Settlers of all descriptions, Retorts of all sizes and shapes, for Silver and Gold, Portable Stamp Mills, Straight Batteries, for wood or iron frames, Dry Crushing Batteries, or machines with the latest improvements, every variety of Stamps, Mortars, Cams, Pans and Tubs. **BLAKE'S PATENT QUARTZ CRUSHERS**, of all sizes.

**OIL BORING TOOLS AND MACHINERY.**—Of the latest and most approved construction, made from drawings lately made by Prof. Blake at the oil wells in Pennsylvania. We have the facilities for working gold and silver quartz and other ores, to test their value, by the hundred weight or ton.

Russia Iron Screens, of all degrees of fineness and of all qualities of iron. All work done in the best manner at the lowest cash prices.

All kinds of Sheet Iron and Water Pipe, Cast Oil Stills, Wrought Iron Worms, etc., etc. Manufactured to Order.  
**Old Boilers Repaired**  
**D. CAMERON.**  
6v12-1y

AN EXPERT.—Our readers will remember the article on auriferous sulphurets in our issue of Feb. 23d. We were reminded of the experiments therein detailed, and also of the ignorance which is too often exhibited on the subject, by the following from the *Alpine Miner* of a late date:

"Last summer, Mr. Wade of the Pioneer mill, Markleeville, obtained at great expense the services of an accomplished and experienced amalgamator, from Silver City, and on the assumption that there would be no bungling this time, several of our mining companies hauled their ores down for treatment. The Winchester Company, of this place, took down three tons, showing a value by assay of from \$6 to \$90 per ton, which underwent the skillful manipulations of this expert from Washoe, and turned out a lump of crude amalgam about as large as a chestnut. We were in the mill while the tailings were being run off, and noticing that the sluices ran an inch deep with bright, clear sulphurets, we asked the 'man on whom Alpine could rely,' if it might not be possible that the precious metals were in this ore, combined with these sulphurets, and were told that those were only iron pyrites and never contained anything of value!"

No CHANCE FOR THIEVES.—At the Nevada mill, Virginia, Nev., the amalgam strainers are encased in stout sheet iron, and furnished with a lid of the same material, kept secure from amalgam thieves by means of a padlock, the key of which is in possession of the foreman.

**TOWNE & BACON,**  
Book and Job Printers,

**Superior Workmanship**  
of Mr. LOCHHEAD, who has been in the business in San Francisco for the last fourteen years, and enjoys the reputation of having built ONE HUNDRED AND SEVENTEEN STEAM ENGINES.  
Screw Propellers of all kinds, and Steam Boat Machinery generally, made to order, and warranted to give perfect satisfaction in every particular. 25v12-3m

**SKELETON LEAVES.**—Dr. G. Dickson, of Edinburgh, Scotland, communicates to the Botanical Society of that city, the following method of preparing these leaves: "A solution of caustic soda is made by dissolving three ounces of washing soda in two pints of boiling water, and adding one and a half ounces of quicklime previously slacked; boil for ten minutes, decant the clear solution and bring it to boil. During ebullition add the leaves; boil briskly for some time—say an hour—occasionally adding hot water to supply the place of that lost by evaporation. Take out a leaf, and put it into a vessel of water, and rub it between the fingers under the water. If the epidermis and parenchyma separate easily, the rest of the leaves may be removed from the solution and treated in the same way; but if not, then the boiling must be continued for some time longer. To bleach the skeletons, mix about a drachm of chloride of lime with a pint of water, adding sufficient acetic acid to liberate the chlorine. Steep the leaves in this until they are whitened (about ten minutes,) taking care not to let them stay in too long; otherwise they are apt to become brittle. Put them into clean water, and float them out on pieces of paper. Lastly, remove them from the paper before they are quite dry, and place them in a book or botanical press."

**ITALY VS. ENGLAND.**—An Italian house has carried off an enormous contract for basin, docks, factories and other works connected with the enlargement of the Chatham (Eng.) dock-yard, over the heads of the English bidders.

There are nearly twice as many papers published in the United States as in the rest of the world put together.

**To Owners of Copper Mines and Smelting Works.**

A PERSON OF LARGE EXPERIENCE IN COPPER Smelting, both in the Atlantic States and California, wishes a situation as Superintendent of an establishment for Smelting Copper. Address "W," care of Mining and Scientific Press. 5v141f

## THE PACIFIC IRON WORKS,

First & Fremont Sts., between Mission & Howard, San Francisco.

The proprietors of the above Works invite the attention of all parties interested to their greatly improved and unequalled facilities for manufacturing Steam Engines and Boilers, both Marine and Stationary, of any required size and pattern, Quartz Mills, Amalgamating, Pumping and Hoisting Machinery of the most approved construction. Flour, Saw, and Sugar Mills, Water Wheels, &c. Our pattern list is most complete and extensive, embracing the late improvements in all classes of machinery adapted to use on this coast. We would call especial attention to the fact that we have secured the exclusive right of manufacture for the Pacific Coast of the celebrated Green Engine, conceded to be the most economical and perfect working Engine now in use. We are also exclusive manufacturers of the celebrated

Bryan Battery, Varney's Amalgamators and Separators, Ryerson's Superheated Steam Amalgamators and Rotary Crushers, Stone Breakers, &c. Orders respectfully Solicited.

GODDARD & COMPANY.

## ROWLAND, WALKER & CO., GROCERS,

Nos. 516 and 518 Washington street,

Also offering a complete assortment of GROCERIES at the  
LOWEST RATES. Quality guaranteed.

Goods delivered at any point within the city limits.  
22v13-1y

**NEW YORK PRICES.**

## REMINGTON'S ARMORY.

Agency, 310 Washington st., San Francisco.

## PRICES REDUCED!

These arms have been preferred by the United States Government, and stand unequalled by any in the world. Revolvers, Army, Navy, Bolt and Pocket, Double and Single Action; Repeaters, and vest-pocket Pistols, with copper ammunition; Police Revolvers, a new model, navy size ball, 4½ to 6 inch barrel; Rifle Cases—an entirely new model—having a range and accuracy equal to a rifle, and a most perfect Cam. All the new models for sale very low.  
12v131f

ALBERT E. CRANE.

**Economy in Advertising.**—The Mining and Scientific Press is the best and most economical mining advertising medium in this city. Our terms are less than one-half the rates now charged by daily newspapers, and the mining community are beginning to appreciate our reasonable rates of advertising. The Press contains proportionally a larger amount of mining advertising than any other paper on the Pacific coast. Its character renders it the proper journal for the concentration of mining patronage.

## RADICAL CURE

19v12-1y

EUROPEAN  
METALLURGICAL WORKS,

Practical Mining School,  
Bryant Street, Between Third and Fourth,  
SAN FRANCISCO.

THE Proprietors are at all times prepared to work or test  
Ores sent to this establishment—either in large or small  
quantities—by such process as may be found best adapted to  
their chemical character, after a careful analysis has been  
made. Test lots of Ore adapted to the smelting process at-  
tended to. Sulphuret, pyrites, and the (so-called) "rebel-  
lous ores," are having especial attention paid to their suc-  
cessful treatment. Assaying in the humid and dry way.  
Also, refining by cupellation, done at moderate rates.

## PRACTICAL MINING SCHOOL.

The proprietors—encouraged by numerous applications  
from gentlemen desirous of pursuing the study of practical  
metallurgy—have concluded to admit parties on reasonable  
terms. Having in their Mill all the necessary appli-  
ances for crushing, roasting, amalgamating, smelting, re-  
fining and assaying, as also a well extended Laboratory for  
the analysis of Ores and Minerals, a good opportunity is  
here offered to acquire a sound practical knowledge of the  
business.

S. P. KIMBALL, J. R. MURPHY,  
10v10

MOSHEIMER'S  
Metallurgic Works

And Practical School for Assaying  
and Metallurgy.

THE UNDERSIGNED HAS REOPENED METALLUR-  
gic Works, and is prepared to reduce any kind of Ores,  
by Smelting, Amalgamating, or other processes, that the  
nature of the ore may require.

Practical instructions given in Assaying, all branches of  
Metallurgy and Technology.

Furnishes Plans and Estimates for the erection of Quartz  
Mills, Smelting and other Reduction Works.

Having carefully studied the science of Concentrating  
Ores, I can offer better concentrating machinery than any  
in use in California, and especially such as will save the  
fine or floating gold and sulphurets.

CONSULTATION OFFICE:  
328 Montgomery street, San Francisco.

SILVER SPROUT MINING Co.—This com-  
pany, which filed its certificate of incorpora-  
tion with the Clerk of the County Court, on  
the 27th inst., has for its object the working  
of gold and silver mines in the Kearsage  
mining district, Inyo county, Cal. The  
capital stock is two hundred and fifty thou-  
sand dollars, in two hundred and fifty  
shares, one thousand dollars each. The  
trustees are as follows: Nathaniel Page, A.  
Wingard, F. H. Alberding, W. N. Wade  
and Almarin B. Paul.

NORRIDGEWOOD MINING Co.—This com-  
pany filed its certificate of incorporation on  
the 26th inst. It proposes to work the Mat-  
tingley ledge, in Nevada county, two miles  
from Nevada city. Capital stock, \$20,000,  
divided into 2,000 shares of \$10 each.  
Trustees: J. W. Clark, George H. Weaver,  
and James E. Perkins.

ROYAL PRUSSIAN SCHOOL OF MINES.—We  
acknowledge the receipt from Messrs. Ad-  
delberg & Raymond, of New York, and Mr.  
Chas. A. Stetefeldt, of Austin, Nevada—of  
copies of a pamphlet concerning the Claus-  
thal School of Mines, mentioned in our last  
issue.

## Quartz Mill Construction and Superintendence.

THE UNDERSIGNED IS AT PRESENT OPEN FOR AN  
engagement as a working Superintendent in the con-  
struction or operation of a Quartz Mill. Has had five years  
steady and successful experience in working and superintend-  
ing and is prepared to give the most reliable and practical  
advice in saving sulphurets and the treatment of  
rebellious ores. Is prepared to furnish references for all  
the necessary qualifications of an intelligent, faithful and  
reliable quartz mill operator. Address, F. M. SHAW,  
San Francisco, care Mining and Scientific Press. 19v14-3m

cific Mail Steamship Co's office, corner of Sacramento and

Leidsdorff streets.

OLIVER ELDRIDGE, Agent.

TO VICTIMS OF RHEUMATISM IN  
ALL ITS FORMS.

BE IT KNOWN TO ALL WHO ARE AFFLICTED WITH  
this terrible and excruciating disease, that the means  
of a safe, speedy and permanent cure are within the reach  
of every sufferer, by using

RICHARDS' REMEDY!

For Inflammatory, Chronic, Hereditary and Mercurial  
Rheumatism, Rheumatic Gout, Lumbago, Sciatica, and all  
the modifications of the disease, whether confined to one  
portion of system or entire in its character. Combined  
wholly of VEGETABLE EXTRACTS, it exterminates the  
complaint without injuring the constitution. None but the  
TORTURED SUFFERERS who have been relieved from  
the agony by the operation of this remedy, can realize the  
ecstasy which the mere cessation of long-continued tor-  
ment imparts. Sleep returns, strength returns, health and  
hope return to the pain-worn and debilitated patient, and  
once cured, nothing but the grossest impudence can lead  
to a relapse. The confidence with which these statements  
are made to the public, is the result of many years' ob-  
servation and experience. The reputation of mere palli-  
atives soon dies out, but that of a STEERING MEDICINE,  
which produces, year after year, in all cases, the same ben-  
eficial effects, NEVER DIES. This has been the history of  
Richards' Remedy. Try it!

RICHARDS' REMEDY is for sale by  
H. BOWMAN, Druggist, Sacramento,  
and by Druggists generally.

## Machinery.

STEWART'S  
CELEBRATED HINGED  
Grinder and Amalgamator.

## Is the Cheapest and Quickest Pan

Now used. It is flat-bottomed, loses far less power in throwing the pulp, and circulates the same under the miller to better advantage than any other Pan in use, while the steam, owing to the thinness of the cone, has a more direct effect in heating the pulp. E is the miller plate; F the Grinding Shoe, attached by an adjustable hinge joint in the middle of the same—the bottom wearing down even with the dies.

Mr. J. H. STEWART, the inventor, has had ten years of experience in mechanical operations, and may be addressed at San Francisco, or called on at the Miller's Foundry, First street, where his Pan is manufactured, and is to be seen at any time in operation. 3v14tf

HUNTER'S  
IMPROVED CONCENTRATOR.

THE INVENTOR OF THE ABOVE RECENTLY IMPROVED Machine, is now prepared to take contracts for concentrating gold or silver ore on shares, receiving a certain per cent. of the sulphurets may be agreed upon, and will guarantee twenty per cent. more sulphurets than from any rocker or concentrator built on the Pacific coast, saving at least ninety per cent. of the sulphurets contained in the ore. The sulphurets, if desired for shipping, will contain less than one per cent. of sand.

Persons who have sulphureted ores will do well to have their sulphurets saved; as the many failures in mining can often be attributed to the waste of sulphurets. For particulars, address

One of these Machines can be seen in operation at the Union Foundry, in this city, up stairs.

ANDREW HUNTER, Inventor, 22v13-3m San Francisco.

VARNEY'S  
PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the miller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Sellers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the

PACIFIC FOUNDRY, San Francisco.

## Steam Pumps,

FOR DRAINING MINES OR ELEVATING WATER TO ANY HEIGHT.

BRUCKNER'S  
Mechanical Roasting Furnace

AWARDED A

PREMIUM SILVER MEDAL

—BY THE—

The Mechanics' Institute.

Patented December, 1896,

THESE FURNACES ARE NOW MANUFACTURED AFTER AN IMPROVED mode of construction, which GREATLY SIMPLIFIES THEIR OPERATION,

and afford a much larger oxidizing surface to the action of heat and atmosphere.

The weight of a Furnace nine feet long by four feet in diameter does not exceed one ton.

THE IMPROVED FURNACE

May be seen in operation, for desulphurizing or roasting and chloridizing, at Central Mill, Virginia City, Nevada.

Parties wishing to erect such Furnaces, are requested to leave their orders with

I. KALLENBERG,

19v12 416 Market street, San Francisco.

## Brodie's Patented Improvements

FOR THE TREATMENT OF

## Gold and Silver Ores.

BRODIE'S PATENT IMPROVED QUARTZ CRUSHER. The attention of all interested in Mining is respectfully called to this improved Machine for breaking or Spalling Quartz or other Rocks, possessing, as it does, simplicity of action and lightness of construction, so far as is compatible with strength and durability. In consequence of these advantages, the advertiser is enabled to offer these machines to the public at the following low terms: No. 1—Or 10 inch Crusher, capable of reducing from three to four tons of quartz per hour, no piece being larger than a walnut—price, \$600. No. 2—Or 15-inch Crusher, capable of similarly putting through five to six tons per hour—850. No. 3—Or 18-inch Crusher, will in a similar manner crush from seven to eight tons per hour—1,300.

EXPLANATION OF THE ABOVE ENGRAVING.

The frame is made of cast iron, bound with heavy wrought iron bands, making it very strong, and at the same time light and portable. The crusher is bolted to a wood frame of sufficient height to clear the fly-wheel, and allow the crushed quartz to pass direct to the dotted lines showing the movable and stationary jaws. Letter A represents the eccentric shaft by which the power is applied direct to the movable jaw. B represents the movable jaw, and C the fixed jaw. D represents the link or radius bar. E represents the bolts for regulating the opening. F, which can be regulated at pleasure, so as to graduate to the size to which it is intended the quartz shall be crushed. G represents the feed opening, by which the size of the machine is designated. The arrow on the fly-wheel shows the direction to drive the eccentric, which, in combination with the link, D, gives the movable jaw, B, a forward and downward motion at the same time, and which makes the hardest rock yield and separate into fragments of any desired size.

The above Crushers have been recently erected and are now successfully employed at Bear Valley, Mariposa county, Rawhide Ranch, Tuolumne county, Excelsior Mine, Lake District, Nevada county, and can be seen in operation at the Fulton Foundry, First street, San Francisco. The following testimonial respecting the effectiveness of this Crusher, has been received from the Superintendent of the "Rawhide Ranch" Mine, in Tuolumne county: "I have used your Crushers at the Rawhide Ranch, and they have given me great satisfaction. They are the best I have ever used, and I have no hesitation in recommending them to all who are in need of a machine for rapidly, cheaply and properly preparing quartz for the stamps. Yours truly, R. F. JOHNSON, Supt. Rawhide Ranch Quartz Mill."

JAMES BRODIE, Esq., San Francisco—My Dear Sir: It gives me pleasure to inform you that I have for the past three months and one of your latest size Rock Crushers in use, at the Rawhide Ranch Mining Company's Mill, which is entirely met my expectations; and I have no hesitation in recommending it to all who are in need of a machine for rapidly, cheaply and properly preparing quartz for the stamps. Yours truly, R. F. JOHNSON, Supt. Rawhide Ranch Quartz Mill.

BRODIE'S PATENT IMPROVED GERMAN AMALGAMATING BARREL.—This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, in 1894. Further particulars will be afforded on application to the subscribers.

Those infringing the patent rights to the above Improved Barrel, are hereby informed that on and after the 1st November, 1896, the royalty charged for using the same will be raised to the sum of \$10 per barrel. A diagram, with explanations of this machine, will be found in the "Mining and Scientific Press," of September 29th, 1895.

BRODIE'S PATENT WIND-BLAST SEPARATOR FOR DRY CRUSHING.—This Dry Crusher has been found the most economical and effective mode of crushing ores in Mexico, California and Nevada. Diagrams and explanations afforded on application to the subscribers. A drawing and full description of this machine will be found in the Mining and Scientific Press of Sept. 29th, 1895.

Express Building, 402 Montgomery street, San Francisco. 12v13tf

## Foundry for Sale.

A One-half Interest in the

## UNION IRON WORKS,

SACRAMENTO,

Owned by William R. Williams, is offered for sale on the most favorable terms.

## A Good Bargain

May be had, as the proprietor is going home to Europe. It is seldom that so good an opportunity is offered for a sure and permanent investment. The business of the establishment is exceedingly flourishing, as can be shown. The Shop is of brick, new and well built. The lot is 55 feet front by 163 feet in depth, in a good location for this business, on Front street, between N and O streets.

Inquire at the office of the Foundry, or address WILLIAM R. WILLIAMS, Sacramento, Cal. 26v13tf-19p

## Notice to Miners,

## Well-Borers and Water Companies.

M. PRAG IS NOW PREPARED TO MANUFACTURE Hydraulic and Artesian Well Pipes in the best workmanlike manner, and at the lowest market rates. Having made large additions to my stock of machinery for that branch of business, and am prepared to fill all orders with dispatch, and guarantee entire satisfaction. I also manufacture Mississippi Stoves, of the latest improved patterns, for vessels of all classes. Also, Ship Plumbing done. M. PRAG, 8v13-1y Stove Store, No. 125 Clay street, below Davis.

## To Quartz Miners and Others.

## NOTICE!

I WISH TO CALL YOUR ATTENTION TO A PULVERIZER of my own invention, which I have called the HITCHENS' ORE PULVERIZER.

It is now in operation at the South Park Saw Mill, on Brannan street, between Third and Fourth streets. I am prepared to reduce, to an impalpable powder, quartz, sulphurets, tailings, cement, manganese, charcoal, sands, marble, plumbago, copper ores, etc.

In view of the importance of reducing ores, etc., to an impalpable powder, and being satisfied my invention to be a perfect success, I invite all interested in the subject to examine it. Patent applied for. 1v14-3m JAMES HITCHENS.

STRONG & CO'S  
CELEBRATED UNION PAN!

A fast Grinder and thorough Amalgamator; has double Millers, Rolling Shoes and reverse action. Millmen and others are respectfully invited to examine this Pan, before purchasing others, as it gives the best satisfaction. Can be seen in operation, daily, at the San Francisco Foundry, Fremont street, near Mission. Ores, in lots not exceeding 2,000 pounds, tested by 22v13 O. W. STRONG, Assayer.

AGENTS FOR

## Thomas Firth &amp; Sons' Cast Steel, Files,

Etc., Shear, Spring, German, Flow, Blister and Toe Call Steel; manufacturers of Mill Picks, Sledges, Hammers, Picks, Stone Cutters', Blacksmiths' and Horse-Shoers' Tools, 319 and 321 Pine Street, Between Montgomery and Sansome, San Francisco. 1v14-1p

## FOR SALE!

PATENT RIGHT OF HUNT'S WINDMILL for the State of California or the whole Pacific coast.

This Mill is superior to any other, can be built cheaper, and is more durable.

Full sets of patterns for four sizes Self-Regulating Mills, and three sizes of Adjustable Mills, will be sold with the right.

This Windmill has been extensively advertised all over this coast, and is favorably known.

Apply to E. O. HUNT, 28 SECOND STREET, 1v14-1m San Francisco.

## Nitro-Glycerin!

WE ARE INFORMED THAT CERTAIN PERSONS ARE endeavoring to manufacture and sell Nitro-Glycerin, to be used for Explosives in Oil Wells, Blasting or other purposes.

This is to notify the public that the United States Blasting Oil Company is the sole owner of the Nobel Patents for manufacturing Nitro Glycerin, and for exploding the same; and that any and all infringements of the Company's rights will be prosecuted in law.

The Company is now prepared to supply any desired quantity of the best quality of Nitro-Glycerin to the public, with instructions how to use it and avoid accidents. Orders to be addressed to JAMES DEVEAU, Secretary, 32 Pine street, New York.

T. P. SHAFER, President U. S. Blasting Oil Company, 32 Pine street, New York. 1v14-1m

## Pratt's Abolition Oil.

FOR ABOLISHING PAIN—THE BEST REMEDY IN existence for Rheumatism, Neuralgia, Paralysis, Headache, Toothache, Sore Throat, Diphtheria, Weak, Swollen and Stiff Joints, Contracted Coils and Muscles, Cramps, Colic, Diarrhoea, Cholera, Pains in the Breast, Lame Back, and all aches and pains. It is the poor man's friend, and the best family physician. Full directions accompany each bottle. Price 50 cents and \$1 per bottle. For sale by all dealers in medicines. Sole Proprietors, A. McBOYLE & CO., Druggists and Chemists, 524 Sacramento street, opposite What Cheer House, San Francisco. 1v14-1y

STREET RAILROADS IN ENGLAND.—The English prejudice against street railroads is fast giving away before the logic of events. The authorities of London, after putting themselves in communication with the city officials of various American towns and cities, in which these modern conveniences have been introduced, have come to the conclusion that, after all, they are something more than mere "Yankee notions." The English are a slow people with regard to social improvements; and usually hesitate long before introducing any innovations into their long established customs and ways of doing business. We may instance, as a case in point, their persistence in employing closed cars upon their railroads, and refusing to establish any direct communication between the passengers and the engineer, even at the expense of numberless horrible accidents and outrages, which such a simple change would obviate without any possible harm, except to prejudiced notions. In the matter of street railways, however, it is more than possible that by the time they become well introduced into English cities, a better thing will find its way into American streets. The experience at the East, as well as in this city, is fast raising serious objections to the employment of such conveyance for city traffic. The rail is found a most intolerable nuisance to carriage travel, and rendered doubly worse than it need be by the persistence of street railway companies generally refusing to keep their portion of the street in order, according to the terms of their charters. They are, moreover, quite too apt to think their improvements are of so much value to the public, that there is no need of any special accommodation from either the companies or their employes. Hence, constant irritation and ill feeling is kept up, which, if continued, will eventually destroy the value of such property by the introduction of a different mode of conveyance. There is no difficulty in the way of such a result. A continuous Nicholson pavement, and low-wheeled, easy-riding carriages, would readily supplant street railroads in this city, or any where else, when the experiment should be fairly tried. Our English friends might do well to make a note of this.

PETROLEUM FUEL.—We read very favorable accounts of the improvement lately made by Mr. C. J. Richardson in connection with this subject, which seems chiefly to consist in the introduction of steam among the ignited fluids, by means of which it is stated the heavier oils may be burned, and these, burning, caused to yield a much larger equivalent of heat than can be obtained from the more volatile products. The convenience of a liquid fuel, in many respects, is very manifest, and if it can be brought within the requisite economic limits, its applications would be numerous and important.

THE VENTILATION OF MILLSTONES.—A very important case has been lately decided in the English patent courts with regard to the above subject, the verdict being against the claimant or patentee, and securing to the public right to use the process, which seems to be of great value, enabling more than three times the quantity to be ground, which could be otherwise worked in the same time. The process consists simply of an application of fans, to induce currents of air through the stones in company with the grain and flour, and of porous material to separate the flour from the escaping air.

TO COPY MANUSCRIPTS.—The following method for obtaining copies of manuscript papers will be of great service to those who wish to preserve copies of what they write: "Put a little sugar in common writing ink, and with this write on common paper, sized as usual. When a copy is required, take some unsized paper and moisten it lightly with a sponge, then apply the wet paper to the writing, and pass lightly over the unsized paper a moderately heated iron, and the copy is immediately reproduced."

MORE CO-OPERATION.—Another mammoth scheme of co-operative labor has been announced among the iron workers at Darlington, England. Extensive rolling mills are to be erected. This is better than "strikes."

**LEAKS.**—The Gold Hill News of March 11th has the following: A few days ago, Mr. Pierce, a new superintendent of the Union mill, in Gold Hill, had occasion to dig into the earth under the mill to construct a subterranean drain, and on examination of the soil, he found it filled with crude amalgam and quicksilver. Workmen are now engaged in digging up the earth underneath and putting the whole through an amalgamating mill process. The probability is, that enough money will be realized from this source to pay off some of the debts hanging over the property.

**THE AIR TREATMENT FOR WOUNDS.**—M. Boisson has introduced a method of treating superficial wounds by a jet of air from the common bellows, immediately forming a dried film over the exposed flesh, beneath which healing is greatly facilitated and other advantages secured. Burns which have removed the skin may be treated advantageously in this way.

**Perry Davis' Vegetable Pain Killer.**

The Great Family Medicine of the Age! Pain Killer, taken internally, should be indicated with milk and water, and sweetened with sugar if desired, or made into a syrup with molasses. For a Cough, a few drops on sugar eaten will be more effective than anything else. For Sore Throat, gargle the throat with a mixture of Pain Killer and water, and relief is immediate and the cure positive.

It should not be forgotten that the Pain Killer is equally as good to take internally, as to use externally. Each bottle is wrapped with full directions for its use.

Please read the printed directions.  
Sold by all Medicine Dealers everywhere. 9v14-1m

**Allen's Lung Balsam**

Is warranted to break up the most troublesome Cough in an incredibly short time. There is no remedy that can show more evidence of its merits, than this Balsam, for curing Consumption, Coughs, Colds, Asthma, Croup, etc.

To Physicians—Physicians having consumptive patients and having failed to cure them by their own prescriptions if they desire to try Allen's Lung Balsam, by writing to the proprietors they will send a formula which will enable them to judge whether the ingredients are of a superior quality or not. The medicinal properties are extracted by a chemical process. The apparatus by which some of them are extracted cost many thousand dollars.

Dr. H. F. Mearns, Resident, Office No. 137 West Sixth Street, Cincinnati, states as follows: "About one year ago I took a cold which settled on my lungs. A violent cough was the consequence, which increased with severity. I expectorated large quantities of phlegm and mucus. During the last winter I became so much reduced that I was confined to my bed. The disease was attended with cold chills and night sweats, a diarrhoea set in. My friends thought I was in the last stages of consumption, and could not possibly get well. I was recommended to try ALLEN'S LUNG BALSAM. The formula was shown to me, which induced me to give it a trial, and I will only add that my cough is entirely cured, and I am now able to attend to my business as usual."  
P. MERRITT.  
Sold by all Medicine Dealers everywhere. 9v14-1m

**Gaston's Screw Grinder and Amalgamator**

—IS—  
**The Best Yet Invented.**

For rapidity and thoroughness of work, the machine above illustrated is unequalled by any. It wastes no appreciable quantity of quicksilver, and is of itself a perfect settler. Fig. 1 represents the pan with part of its side removed, and fig. 2 the screw muller, and its shoes. The letters c show the threads of the screw; H, its shoes, and D a low cylinder within which the screw rotates; E, represents open spaces through the base of the cylinder, and F, inclined partitions filling (at those points) the spaces between the cylinder and the shell of the pan. These inclined partitions are to intercept the current of pulp around the pan, as it issues from under the muller, and turn it toward the center again, over the screw. The dies are not shown in the figure—there are eight. Mercury is not ground, nor floured in this pan. The pulp is ground to a slum, with great rapidity; the muller is raised a little and the quicksilver is poured in *en masse*, forming a layer upon the bottom of the pan. The revolution of the screw then forces the pulp down into contact with the quicksilver, into which it is effectually rubbed by the shoes, while the screw, being constantly fed by the pulp from above it, presses all under the muller outward—still in contact with the quicksilver, through the spaces, E, and thence over toward the center of the pan, when it is again seized by the screw and forced down into the quicksilver, rubbed into and forced off in contact with it, which process is continued as long as desired. The pulp can thus be forced into contact with the mercury at the rate of 1,000 pounds in three minutes, or twenty times per hour, and none can escape contact with the mercury, that contact being under the immense pressure of the perpetual screw, in addition to that of gravity, which (gravity) is the only available force in the other pans for bringing the pulp into contact with the quicksilver. "A word to the wise is sufficient." The Screw Amalgamator is the cheapest and most efficient pan manufactured. Millmen! call and see one running at the Pacific Foundry.

For particulars, address the inventor, H. A. GASTON, at Cosmopolitan Hotel, San Francisco; or R. L. THOMAS, Esq., Virginia City, Nevada. 1v14qr

**Portable Steam Engines!**

"Hoadley's" and "Hittinger's" Make,

**HOADLEY'S.**

**FOUR SIZES,**

8, 10, 12, and 15-Horse Power,

**HOADLEY'S.**

3 to 40-Horse Power.

**HITTINGER'S.**

**THREE SIZES,**

5, 7, and 10-Horse Power

**HITTINGER'S.**

**TWO SIZES,**

5 and 7-Horse Power,

COMBINING THE MAXIMUM OF EFFICIENCY, DURABILITY, and Economy, with the Minimum of weight and price.

These Engines are favorably known, a large number being in use on this coast for hoisting, pumping, threshing, milling and mining purposes.

Steam can be got up on these Engines in fifteen minutes after reaching the place of operation, and the time, expense of setting boilers, machinery, and "construction account" saved, (which is often the difference between the successful and unsuccessful prosecution of mining enterprises,) in fact, the portable principle is the miner's friend, and enables him to draw engines on their own wheels, to his cabin door, and plant on the outermost confines of civilization the saw and grist mill, and it has done and will do more to help subdue the continent than any other of the modern motors which are crowding society and normalizing the world.

All sizes on hand from 3 to 30 horse power, with an without carriages.

Also, Portable Saw and Grist Mill.

## HENDY'S LATEST IMPROVED CONCENTRATORS,

FIG. 1.

FIG. 2.

### FOR GOLD AND SILVER ORES,

With Revolving Stirrers and Rotary Distributor.

Can be seen in Operation at the Union Foundry, First St., San Francisco.

#### Directions for Operating Hendy's Concentrators:

The sulphurets are drawn off while the Concentrator is in motion, in the following manner:  
FIRST—Set the Pan, A, level, by its inner rim.  
SECOND—While in operation, keep the Pan, A, about half full of sulphurets. [See Figure 2, marked S.]  
THIRD—Open the gate, E, sufficiently to discharge the sulphurets as they accumulate over the amount above mentioned.  
FOURTH—The crank shaft to make 200 to 220 revolutions per minute.

#### References:

Reference is made to the following mills, which have HENDY'S CONCENTRATORS in use:  
EMPIRE MILL.....Grass Valley, Nevada County.  
GOLD HILL MILL.....Grass Valley, Nevada County.  
CONEY & BIGELOW MILL.....Jackson, Amador County.  
SPRING HILL MILL.....Amador, Amador County.  
GOLDEN GATE MILL.....Volcano, Amador County.  
OPHIR MILL.....Placer County.  
C. H. SCHNABLE'S MILL.....Doty Flat, Placer County.  
GOLDEN RULE MILL.....Stewart Flat, Placer County.  
BENTON MILL.....Bear Valley, Mariposa County.  
LOUISIANA MILL.....Coulterville, Mariposa County.  
RAWHIDE RANCH MILL.....Jamestown, Tuolumne County.  
PEOPLE'S MILL.....Allegany, Sierra County.  
TYRON & CO'S MILL.....Prescott, Arizona.  
WOOLSEY & CO'S MILL.....Prescott, Arizona.  
NOYES & CO'S MILL.....Prescott, Arizona.  
GUADALUPE & SACRAMENTO G. & S. M. CO.....Sinaloa, Mexico.  
TRIUNFO G. & S. M. CO.....Lower California.

And in use in many other parts of this coast.

For description, etc., see files of the MINING AND SCIENTIFIC PRESS.

Those in want of Concentrators would do well to visit some of the quartz mills that have Hendy's Patent Concentrators in use, and satisfy themselves before purchasing other Concentrators of pretended merit.

#### Remarks:

Many Concentrators have been gotten up in this city. Some of these claim foreign origin; others are of home production. The sonorous Greek names, with which some of these have been dignified, ought, it would seem, to have entitled them to a better fate than that which has befallen them. A large proportion of these machines are now "numbered among the things that were." A few were still-born; never having had an existence except in the shape of advertisements and cuts, prematurely prepared by their too confident projectors. For one of these it was claimed, with a grand flourish of trumpets, that it had no "tilting-traps or other gimcracks, to be ever out of order or in the way." Unfortunately, however, although it had a reasonable supply of legs, it obstinately refused to run. Amputation failed to remedy the defect, and it now lies forgotten among a heap of old iron,—a mechanical abortion.

For further particulars, read article on Concentrators in the Circular of the Union Iron Works, for 1866, pages 51, 53.

#### CAUTION.

All of HENDY'S PATENT CONCENTRATORS are marked thus:

"J. HENDY, Patented February 27th and April 17th, 1866."

Orders or letters of enquiry, address,

JOSHUA HENDY, Patentee,

## Pacific Business College

### Telegraph Institute,

(MECHANICS' INSTITUTE.)

Post street, between Montgomery and Kearny.  
THIS INSTITUTION is designed to prepare Boys and Men for

**Business Pursuits,**  
And to impart a thorough

**Commercial Education.**  
It is conducted upon actual business principles. The student, upon entering the College is furnished with a

**Capital in Cash and Merchandise,**  
Rents a place of business, opens an account with the bank, insures his goods with the insurance office of the College, and enters upon the area of business. He

**Commences Speculation,**  
Carrying out all the details of trade—buying and selling goods, depositing in and checking from the bank, making and negotiating notes, drafts, bills of exchange, etc., recording the transactions and keeping the books in a regular and scientific manner. From this he advances to other capacities, until he finally takes his position in the

**Union Business College Bank,**  
A regularly established institution, complete in all its appointments, and having a circulation of

**One Million in College Currency.**  
This course saves from four to six weeks' time in copying useless manuscripts.

**Pennmanship.**  
PROF. F. SEREGNI, our instructor in Pennmanship, is well known to be a thorough and systematic teacher. And no College at present on this coast advertising to teach Pennmanship, has ever taught the same by a regular, systematic plan, and we unhesitatingly declare, that for practical and systematic instruction in this branch, we challenge competition.

**Telegraphing.**  
The large and increasing demand for good Telegraph Operators has induced us to organize a separate department or thorough instructions in this branch, and we are now enabled to present advantages in this line equal to any that can be afforded on the continent. Several instruments are in operation, and others will be added as occasion requires. So great is the demand for operators, that no young man, well qualified, need be wanting a situation. A skillful and accomplished operator has charge of the departments, and will devote his special attention to the advancement of the students under his charge.

There is no vacation, and students can enter upon any business day during the year. The public are invited to call and examine the various departments. Sessions day and evening.  
For Circulars and further information, address

### An Improved Cesspool Cover.

We give annexed a representation of a very important and useful device, invented by Mr. Taylor, of the firm of Taylor's Sons, 429 Pacific street, the object of which is to prevent the escape of gas from sewers, cesspools, etc., which is often a source of very great annoyance, and not unfrequently the producing cause of fatal disease. The principle of the device will be readily understood on reference to the illustration. The upper portion is termed a "garbage box,"

and is constructed like an ordinary "steamer" for culinary purposes. Its use is to drain off the useless liquid when it is desired to save the garbage from the kitchen, for swine. This can be removed at pleasure, and the "slops" from the house, when poured into the iron pan beneath the garbage box, pass down into a globular projection below the cesspool cover, across the interior of which is a partition reaching to near the bottom, under which everything must pass on the way to its exit from the discharge orifice, seen on the left. This globular projection being kept constantly filled with water, from the hydrant or otherwise, the entrance to the cesspool must be constantly and effectually sealed, so that no gas can escape from it to the outer air.

The device is a most important one, in view of the preservation of health in crowded communities, and should be universally introduced.

### Hooker's Patent Pump Valve.

A patent for this improved pump-valve was recently obtained for the inventor, Mr. W. D. Hooker, through the MINING AND SCIENTIFIC PRESS PATENT AGENCY.

WOOD & MANN'S PORTABLE STEAM ENGINE.

The valve may be made of iron or other metal. A, A, A, are the guides which work in the corners of the valve chamber, and secure the valve from turning. B is the body of the valve. F shows the edge of the india rubber facing, which is secured to the bottom of the valve by a washer and screw, the end of which is seen at C.

Fig. 1.

Fig. 2.

Fig. 2 represents the valve-seats and chamber in which the valves operate. The advantages claimed for this valve are:

1. Cheapness of construction. 2. Greater durability. 3. As it rises square from the seat on all sides, the area for the passage of water is largely increased at a small elevation of the valve, thus insuring the discharge of more water than the common

pump valve. 4. With this valve a pump may run at a high rate of speed, and insure a large supply of water.

The efficiency of this valve has been well tested by its use in the Excelsior Pump, invented by Mr. Hooker, and before noticed by us. These pumps are manufactured of various sizes, by Messrs. H. J. Booth & Co., at the Union Iron Works, in this city. Some of our most practical mining engineers have adopted them into use, and so far as we learn, they have given satisfaction. Mr. Hooker is a California inventor of no ordinary genius, and we are pleased to note that his pump has been steadily growing in favor.

We are informed that patent rights, for the use and manufacture of this valve, can be purchased by applying to Capt. V. Cushing, No. 120 Front street, San Francisco.

PERSONAL.—Mr. Charles Liebenau, mining engineer and metallurgist, a Freiberg graduate, and one who has spent a considerable time in examining the mines and metallurgical works in Saxony, and other parts of Europe, has called upon us. He is about to leave for Oro, Flint District, Owyhee county, Idaho; whither he goes with the intention of practicing his profession. He comes highly recommended, and refers, by permission, to several gentlemen in this city, as well as in New York.

ENSLEY'S GAS.—A trial of this new patent illuminating material was made last night at the Pacific Woolen Mills. It proved a complete success.

### Portable Steam Engines.

The steam boiler and engine in a portable form, long ago became an object of special interest as a motive power in certain departments of industry in England; but due credit is to be awarded to the American intellect—ever quick to take advantage of every new step in the way of progress—to greatly enlarge the boundaries of its application by simplifying, cheapening and otherwise improving upon its manufacture.

We give herewith an illustrated description of a medium-sized engine, with boiler, as a representative of this class of machines, manufactured at the works of Wood & Mann, Utica, N. Y., who, from having for the past fifteen years made a specialty of this particular class of engines, have done much towards its introduction into general use, and adding to its popularity as a motive power, taken in connection with the fact that it possesses in a great variety of cases advantages far superior to those of the stationary kind. Saying nothing, as to very obvious advantages to the farmer for driving his threshing and separator, to the architect for raising the material for his building, to the pile-driver and others, and with a mere allusion to its almost universal adaptability as a motive power for wood-sawing, pumping, reaping, threshing, for planing and shingle mills, portable sawmills, and for various other purposes which will readily occur to the mind; we would call the attention of our readers to those points of advantage it possesses for facilitating some departments of labor associated with our mining operations, where the stationary engine would be far more expensive and cumbersome—often wholly unfit for the demand of the hour.

It is, for instance, just the kind of power needed by the river and hydraulic miner, for hoisting or pumping, being readily transferred from point to point as occasion or necessity requires.

To the quartz operator, it evidently possesses advantages in certain instances, which cannot be claimed for the stationary engine, generally in use, requiring no machinist at high wages to superintend its erection, to put it in operation, and to make the necessary and often expensive alterations, so frequently causing vexatious delays, if not financial ruin; but is always in order and ready to be fired up, on arriving at its place of destination, to work at mill, shaft or pump, wherever and whenever its services are called into requisition.

To quartz prospectors it must be invaluable, varying as it does in capacity from a 4-horse power, easy of transportation and adapted to the lightest class of machinery, to one sufficient for all the purposes of a 20-stamp mill.

In this connection, we would suggest the hope that the day may not be distant when California ingenuity will find some mode of turning the late improved portable fire engine to good account in washing down our immense banks of auriferous gravel deposits. It is quite possible that the causes

of failure in any attempts hitherto made in this direction, are not beyond the reach of genius, enterprise and capital.

The machine here illustrated is well described in the *Country Gentleman*, as follows:

"It will be observed from the engraving, that the working machinery is placed *above*, instead of at the side of the boiler, as was the case in the engines formerly made by Mr. Wood. He is convinced that this is a decided improvement. The boiler includes perfect circulation of water around the furnace; an arrangement preventing water or "foam" from getting into the steam pipe; stands for the principal journals so made as to prevent their ever heating; two fly wheels instead of one, thus avoiding a one-sided strain, and furnishing power for two machines, if desired, at the same time in different directions; a governor, perfectly controlling the speed; a heater, by means of which the water enters the boiler hot, saving much fuel, as the heating is done by the exhaust steam which has already performed its work, and afterwards does still more by passing into the smoke-pipe, killing sparks and creating draft; good facility for cleaning the boiler tubes; and lastly, such an arrangement of the furnace that no sparks can escape from it or from the ash-pit.

All the work is made from drawings, and every part is carefully modeled according to a fixed scale, and can at once be replaced should it be broken or lost, one part being a duplicate of the other."

These engines may be seen at the establishments of Messrs. Baker & Hamilton, both in this city and Sacramento.

**IRON WORK FOR THE STATE CAPITOL.** We had the pleasure, a few days ago, of seeing at the Miners' Foundry some of the various drawings and designs for the iron work intended for the State Capitol, all of which appears to be in good taste; while some of them—more particularly the ornamental—may be said to be really beautiful, doing much credit to Mr. Cummings, the architect, who executed them. Among the latter, as deserving special attention, is the coat-of-arms for the State, to be executed *in relief*, one of which is to be placed over the doors of the principal halls and of the library. The contract, which was awarded to the Miners' Foundry of this city, will require nearly 1,000 tons of iron, at a cost, including labor and transportation, of about \$100,000. Among the heavier articles, we noticed no less than twenty massive columns, weighing each eight tons, or 160 tons in the aggregate.

This foundry has also recently received an order for machinery from a New York company—the Combination Silver Mining Company—who have a location of 5,000 feet in the celebrated High Bridge ledge, Philadelphia district, in the State of Nevada. They have ordered a 40-stamp mill, together with all the necessary fixtures and machinery for the same, with the intention of adding forty stamps more before the winter sets in. We have learned from sources wholly reliable, that this company have not only rich rock—working by mill process from \$200 to \$500 per ton—but apparently a great abundance of it; the ledge being said to crop out for 5,000 feet, with a width of from ten to thirty feet.

**SOUTH BEACH IRON WORKS.**—Messrs. Newsham & Bigwood—long known here as practical mechanics—have recently set in operation, on King street, near Third, an enterprise for the purpose (as may be seen in their card) of forging all sizes of high and low pressure marine engines, every imaginable description of iron work for mills or houses, and also everything pertaining to a general ship-smithing business. They can ask no better guaranty of success than the reputation which they bring with them to this new enterprise by means of the skill which they are said to have exhibited here in some of the largest and most difficult manipulations in this department of mechanics.

**THE LAST REBEL.**—Tho Memphis *Avalanche* claims that Gen. B. C. Hill, of Warren county, Tennessee, was the last Rebel officer who surrendered himself and forces, and who fought the last battle of the war. He was paroled at Chattanooga on the 17th of May, 1865.

## Communications.

IN THIS DEPARTMENT we invite the FREE DISCUSSION of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[Written for the Mining and Scientific Press.]

### The Reduction and Concentration of Auriferous Ores.

BY DR. L. LANSZWEERT.

[Continued from Page 194.]

This is a table from ten to fourteen feet long, and from four to six feet wide; slung by means of four chains leading back, and with its head resting against a block of timber. It is pushed forward by means of a lever, and when released swings back against the block with a smart blow; making from twenty to fifty blows per minute. The sand and water is run on to the head of the table and flows down it, carrying off the lighter material, the heavier being retained on the table, and gradually brought up to the head by the force of the percussion blow. In dressing ordinary ores, a table of the size mentioned will put off from one to one ton and a half in twelve hours, and the material retained on it still mixed with such a proportion of the poor waste, as to require a second and sometimes a third dressing. These known defects evidently rendered the percussion table inappropriate to the concentration of sulphides in Australia, where material and labor are so costly, however useful it may be under more favorable conditions in this respect. The object in trying this table was, therefore, to see if its defects could not be remedied, or the percussion principle applied to more advantage. Careful observation of the working of a small percussion table soon led to the conclusion that the cause of its imperfect action was the *heavy bank formed upon it by the sand* which prevented the blow from producing its full effect on the heavier particles; and it was evident that the action would be much improved if the sand on the table could be kept loose, in a semi-fluid state, so as to allow the blow to produce a maximum effect.

When finely ground ore is suspended in disturbed water, a blow given to the side of the vessel containing the mixture will check the current, and tend to settle the materials in suspension in the order of their specific gravity—the heavier particles falling first; and even where gold or any of the sulphides are in such a fine state of division as to float on the surface of the water, a similar blow will at once cause them to sink, and at the same time draw them towards the point where the blow is applied. This is the action of the percussion table; and when the sand on the tables is kept loose, the pyrites, however finely crushed, are thrown down by the sudden check given to the current of water by the percussion blow, and drawn below the surface of the sand on the table, where it is protected from the action of the water, and gradually accumulates towards the head, the point where the blow is given. To apply this principle with success, several details require to be attended to. If the sand is allowed to form a hard bank on the bed of the table, the pyrites cannot settle into it readily; and if the sand is kept too loose, the motion of the table forms a wave, which tends to throw the pyrites to the surface and again exposes them to the risk of being carried off by the current of water.

Numerous experiments were made to ascertain the form of stirrer best calculated to meet these requirements. That finally adopted is not unlike the prong of a sluice fork, and is made of quarter-inch railroad iron. They are set about an inch and a half apart, in rows, each row being fixed into an axle working on gudgeons nine inches above the bottom of the table, on which the curved ends of the stirrers always rest, the axles allowing each row of stirrers to rise or fall with the table. The bed of the table is covered with light boiler plate to reduce the wear, as grooves are soon formed in a wooden

bottom over a disturbing board, which delivers them in an even sheet over the sloping head, clear of the sand in the table. The suspending chains have regulating screws on each, for the purpose of adjusting the levels.

The upper chains are fixed, but the lower ones pass over and are attached to a roller, by means of which the inclination of the table can be altered at pleasure, without disturbing the cross levels. When put to work, the table is set with a slight inclination to the head, and is gradually lowered whenever the sand at the head collects to over two inches and a half in depth. The tailings should then be diverted to a spare machine, and clear water only allowed to run over the table. After working a longer or a shorter time, according as the sand operated on may be poor in sulphides or the contrary, the table will become loaded with pyrites. For a few minutes the bulk of the pyrites will have collected at the head, when the table must be stopped, the pyrites shoveled out, and then the work resumed as before.

Hitherto the machine has only been worked at the Good Hope mine, the table used there being a small one, two feet nine inches wide, with a bed seven feet long. Through this was passed the waste tailings from heads of stamps—*thirty-five to forty tons per week*—and carefully sampled, at short intervals, before going into the table and after leaving it, the samples being all filtered through close-woven calico. The assay of these samples, made at the office of the Port Phillip Company, gave the following results: Gold contents of waste tailings before going on to the table, 17 dwts. 22 grs. per ton; after leaving the table, 3 dwts. 4 grs. per ton; amount of gold retained in sand on table, 14 dwts. 18 grs. per ton—equal to 82.3 per cent. of total gold contents. The gold-bearing material saved on the table consisted principally of decomposed pyrites converted into oxide of iron. It is probable that each of these particles of oxide contains a nucleus of undecomposed sulphide; yet, the partial oxidation is sufficient separation from the quartz sand, and the saving of such a large proportion of this material is equivalent to a saving of from ninety to ninety-five per cent. of the undecomposed sulphides. Three of these tables are now in course of erection at the Good Hope mine, and one at Chunes, where it is being worked on different kinds of material with great success. Hitherto the close concentration of the sulphide in the waste tailings could not be effected without such an increase in the loss as more than balanced the gain through having to treat a smaller quantity of pyritous sand. With the table a much higher degree of concentration can be effected, without the risk, than by any other means previously discovered, and there will be a corresponding decrease in the cost per ounce extracted. No doubt experience will lead to improvements in the working and construction of this table, but even in its present form it surmounts the difficulty which has so long stopped the way; it is simple, inexpensive, and easily erected; and when worked in conjunction with the system now in use at Chunes for extracting the gold, will obtain from seventy to seventy-five per cent. of the gold at present lost in the waste tailings, at a cost not likely to exceed 10s. per ounce.

### Central Nevada.

**EDITORS PRESS:**—The southeastern portion of the State of Nevada is certain to attract great attention during the coming summer. It presents a fine field for capitalists, merchants, prospectors and miners. A few facts will show that it is indeed the poor man's country.

SILVER BEND is the term now generally applied to the southeastern of what has hitherto been called the Reese River country, and includes Philadelphia, Hot Creek and Reveille districts. The celebrated mines of the Philadelphia district were discovered in October, 1865; but their great value became known only in May following. The Highbridge mine, located by a "broke" prospector, was sold by him for \$10,000. It may now be sold at any time for a quarter of a million dollars! A person in whose name 200 feet on the Transylvania ledge was located, that he might deed back to another party, gave the ground away for \$100. By the \$100 purchaser it was sold for \$11,000; and recently Col. Buel sold it for \$70,000. These are a few specimens of the chances possessed by the poor man in the Silver Bend country. J. D. E.

[Written for the Mining and Scientific Press.]

### The Occurrence of Tungstate of Manganese in Nye Co., Nev.

WESTON, Mammoth District, }  
March 17, 1867. }

**EDITORS PRESS:**—In your issue of the 2d ult., you refer to the mineral, tungstate of manganese. You are correct in surmising that the specimen submitted by you to Prof. Blake, and the mineral referred to in Siliman's *Journal of Science* (copied from the Reese River Review) are from the same locality; as they were both from the Enterprise mine in this district. The other mine mentioned (the Erie) also produces it in small quantities. These lodes are large and well defined veins of quartz, and are among the most noted of our silver lodes. In the former the mineral occurs in a compact streak, about two inches in width, occupying the outer edge of the quartz next to the "foot wall;" the other part of the lode carrying silver with the line of division well marked. At the surface there was no indication of this mineral; the entire width of quartz being rich in the various combinations of silver; chlorid of silver, and brittle ore of silver predominating. At the depth of twelve feet, it made its appearance as described above, and extended down for forty feet, where it "gives out" as abruptly as it "comes in," giving place to sulphuret of silver.

Without denying to Mr. Hubner (whose name the new mineral bears) the credit of its discovery, or rather its properties, I will mention a much earlier notice of it.

Dr. A. Blatchley, then residing at Austin, and being in Mammoth early in the spring of 1865, I called his attention to this strange looking mineral, and he pronounced it to be tungstate of manganese—entirely new to the scientific world. This, I am of opinion, was previous to Messrs. Riote and Hubner's analysis.

Prof. Adelberg goes wide of the mark, when he says it occurs in metamorphic clay slate; for the only lodes in Central Nevada known to produce it, are in this district (and are undoubtedly the same referred to by Prof. A.) They traverse a wide belt of coarse feldspathic granite; associated with the lode is porphyry and fluor spar, the latter beautifully crystallized, and with the former occur the most perfect and remarkable twin and other formed crystals of feldspar. Very respectfully,

A. J. HOWE.

**WILCOX & GIBBS' IMPROVED NOISELESS SEWING MACHINE.**—This machine, concerning which but little noise has been made, at least on this coast, is a neat, compact, and apparently durable little instrument, simple in mechanism, easily worked, and not liable to get out of order. It can be seen daily at the rooms of Mr. Samuel Swift, agent, 203 Kearny street, nimbly plying away at its task for hours at a time, without dropping a stitch or breaking a thread. If its seam is stronger, more elastic, and less likely to rip in use or wear than the lock-stitch, or if it possess half the merits claimed, it is destined, in spite of the host of excellent competitors already in the field, to work its way here as in the East to a full share of public favor, as rapidly and effectually as it now appears to perform its work.

**THE ERIE CANAL.**—Gov. Fenton recommends the enlargement of the locks of the Erie canal so as to permit steam vessels to pass of 600 tons burden. He does not favor the construction of a ship canal around Niagara Falls, lest it carry commerce from the State by the St. Lawrence.

**EXTRAORDINARY DISCOVERIES.**—Mons. Lejean, who has been sent by the French Government on a journey of scientific exploration to the Persian Gulf, reports having discovered ante-Sanscrit languages, spoken by the mountain tribes between Kashmir and Afghanistan. He has also found two ruined cities of the Persepolitan period.

**SAILING OF THE "COLORADO."**—This fine steamer sailed at noon, on the 3d inst., on her second trip to Yokohama and Hongkong. She carried as passengers, twenty-two in the cabin, and two hundred and fifty-four Chinese in the steerage; and some 1,200 tons of freight.

## Mechanical.

## Cast Iron vs. Wrought Iron.

The value of cast iron over wrought iron, so far as the relative power of the two to resist corrosion is concerned, has long been acknowledged; but is not often duly considered. The purer the iron, the more readily does it corrode. Cast iron is a carbonate of iron—a very impure iron; and in proportion to the amount of carbon it contains, so is it enabled to resist corrosion. Wrought iron water pipes under ground, soon rusts out; while cast iron of the same thickness, remains good after many years use—in fact are considered practically to suffer no deterioration. Wrought iron in boilers decays internally, the most rapidly where moisture and air operate alternately, as in the upper side of mud drums, while they are often, also, eaten through from the outside, by trifling leaks and the constant trickle of water over the surface. A large proportion of boiler explosions are due to corrosion induced in this manner. The British Association for preventing boiler explosions, in their report for 1863, say that no less than forty-seven explosions, attended with a loss of seventy-six lives, were due to that cause of corrosion alone.

One of the great advantages of the Harrison boiler is claimed to be its construction of cast instead of wrought iron. Cast iron was the first material used for steam boilers, and there is much in the present signs of the times to augur a return to first principles in that respect. In proportion to its tensile strength, cast iron is much safer than wrought iron. In a leading article in the *Engineer*, for 1864, it is said:

"It has been so long the custom to consider cast iron as a brittle material, hardly to be trusted under pressure, that it requires some amount of reflection to perceive where in it possesses manifest advantages over wrought iron. The resisting strength of a properly made cast iron boiler is calculable, and a good *a priori* case could have been made out in its favor, long ago.

May not the very brittleness of cast iron, when used in a steam boiler, prove an element of safety? It is a well known fact, as stated by a writer in the *American Artisan*, for Nov. 22d, 1865, that cast iron is *not* liable to be strained by inequality of temperature, it is liable to *break* from such cause, and will give out at once if badly proportioned or improperly used. Wrought iron in steam boilers is liable to be strained by inequality of temperature, and not fracturing at once, goes on straining until its structure is destroyed, and the parts thus strained inevitably give way, death and destruction too often following. Put cast iron in such form as will prevent harm in case of rupture, and it becomes the *very best* material for steam boilers, and one of its best qualities is in giving out when badly treated, a warning not to treat so again. Not so wrought iron; its very tenacity begetting a false security which might lead to disaster at any moment."

It certainly appears strange at a first glance, that such a seeming bad quality as brittleness in any material, should make it more reliable than a more tenacious one, for purposes needing strength. It would appear more strange, if this should prove true, in a material for steam boilers; yet present indications are such as to look very decidedly in that direction.

**DURABILITY OF THE STEAM ENGINE.**—The maintenance of a well made steam engine when entrusted to competent and careful hands, is a thing of but slight import, and such an engine will last for a generation. In fact, it is said that there are engines now doing good service in England, which were built by Watt and his contemporaries. But where are the boilers that started with those engines? Gone, and many succeeding the first, gone also. Well it is, if no human life has been sacrificed in their sudden "going."

**THE LARGEST ANCHOR** in the world has been completed for the Great Eastern, at Wolverhampton, England. Its weight is eight tons, exclusive of the stock; length of the shank, twenty feet six inches; length of the wood stock, nineteen feet six inches; tread of arms, seven feet four inches. The anchor has been proved, and found to stand the strain of one hundred tons.

## Punching Heavy Cannon.

Great improvements have recently been made in machines for punching. It is but a short time since the mechanical world was astonished at the remarkable feat of punching out railroad locomotive wheels, so as to avoid the necessity of welding, which was always uncertain. But we are now told that an English firm has perfected a machine with which they are punching guns of 10½ inch caliber, down through a steel ingot *four feet high*, and weighing three tons! The *modus operandi* of this wonderful achievement, is described as follows by an English correspondent of the *Scientific American*:

The punching is done with a fine pointed punch, in the first place; the hole being started at both ends of the block, and the punch driven in till the two holes nearly meet in the center. Blunt punches of a larger diameter are then driven in to expand the hole, and the diaphragm separating the two holes is forced out. This operation at once reveals any defect in the metal by the severe strain put upon the grain, and so enables a defective block to be rejected before any further labor has been wasted upon it. The hollow cylinders thus formed are beated and a mandrel inserted in the hole, and they are then drawn out under a hammer into tubes, the presence of the mandrel making the thickness of metal acted upon very small compared with a solid forging of the same size, thereby securing a more thorough working. The tubes are again heated and a mandrel having a long stem of somewhat less diameter is introduced into the bore. The tube is then passed through grooved rolls, the mandrel being held stationary by a collar on its stem secured in a frame in front of the rolls, in such a position that the head of the mandrel shall come directly in the center between the two rolls so as to sustain the pressure. The motion of the rolls draws the tube off the mandrel. Another slightly smaller mandrel is introduced and the operation repeated till the tube is brought down to the diameter required. It will be seen that it is quite possible also in this way to produce tubes with a solid end which are well adapted for guns. For gun barrels there is a set of rolls with recesses cut in the grooves to produce the enlarged section required for the breech. The rolls are made to stop for two seconds at each revolution, so as to allow the tube to be properly inserted, though it has been found quite possible to do this without this precaution. This process is very valuable for making hollow railway axles, which aside from being light must necessarily be sound from the nature of the process. It is intended also to apply it to the manufacture of boiler tubes. The celebrated firm of Messrs. Peter Gaudet & Co. are also preparing to carry on this manufacture in France.

**A MAMMOTH SET OF ROLLS.**—Knapp, the famous German founder in Essen, is now engaged in the construction of a mammoth set of rolls, with the view to the rolling of iron plates of such a size as to admit of the making of steam boilers from a *single plate*, by the addition, merely, of the end pieces. These rolls will be *twenty-seven feet long and five in diameter*, each one weighing over 100 tons! In a recent article on some desirable improvements in the manufacture of steam boilers, we called attention to the necessity of just such a machine, with the added importance, however, of some facility for *welding* the joints of the sheet, instead of securing them with rivets, which inevitably work such a large percentage of decrease in the tensile strength of the iron. The same founder is putting up a new steam hammer which will weigh 240,000 pounds, and will cost over one million of dollars.

**A LARGE PUMP.**—The monster Cornish engine and pump, for the Chicago Water Works, the only one of the kind in the country, has been put up and subjected to a trial. It raises the enormous quantity of one million of gallons of water per hour, which is far beyond the capacity of the reservoirs to retain it, or the city's need. We are not told the height to which this water is raised or the horse power of the engine, one or the other of which data are needed to form any proper idea of the size and power of this "monster" engine.

Two of the most active poisons, chlorine and sodium, form our common table salt.

## Scientific Miscellany.

## The Rings of Saturn.

The chief interest which attaches to the planet Saturn, is due to the splendid luminous rings which encircle it in the plane of its equator. Late observations have shown that there are at least four, and possibly a still greater number of these rings. The distance of the inner surface of the inner ring from the surface of the planet is only 18,000 miles; while the outer surface of the outer ring is about 86,000 miles distant. The greatest space between the surfaces of any two of the rings is 1,752 miles. The space between the other rings, though less than this, has never been ascertained.

The thickness of the rings has been variously estimated at from 100 to near 1,000 miles; a moon between the two would probably be about the truth. It is so small as to be scarcely appreciable at the distance of Saturn from the earth. An observer standing upon the equator of that planet at the equinoxes, and at the noon of its day, and looking upward, would see a broad, but dimly defined arch extending directly overhead, from the eastern to the western horizon. As the sun gradually descended to the west, the eastern portion of this line would become illuminated, and present the appearance of a long curvilinear arc of light, gradually elongating until the sun passed out of sight, when it would as gradually disappear from the west, and soon after reappear and commence its increase in the east.

An observer in latitude 45 to 60 north or south of the equator, would, at alternate seasons of the year, be able to get quite a glimpse of the flat surfaces or sides of the rings, as the seasons advanced and receded. Possibly his vision might be able to penetrate through the dividing spaces between the rings; in which case he would behold a series of broad arches of light, one over the other, each as broad or broader than an ordinary rainbow appears, on the earth. Such a sight would be, indeed, magnificent beyond all description!

Of what these rings are composed, how they came there, what keeps them in position, what immediate purpose they serve, no man can tell; at least no one has yet answered these questions in any very satisfactory manner. One imaginative philosopher has suggested that they might possibly have originated from some wandering comet, which, in its eccentric motions, has, anacanda-like, wound its huge tail around the planet's disk; if so, the heavenly wanderer most assuredly caught a tartar, and has been glad to get off shorn of its caudal appendage.

It has been pretty definitely proven, however, that the rings are fluid masses, their density being a little greater than water. Prof. Pierce and Mr. Bond have suggested, and pretty clearly demonstrated, that they must be held in *equilibrium* mainly by the action of the satellites of that planet; and that to be sustained, they *must* be fluid. This would seem the more probable, from the fact that the satellites, eight in number, are all *outside* of the rings, and revolving in the same plane with them and the planet's equator. The rings also are supposed to revolve around the planet like a circle around a central disk. If so, their centrifugal forces would materially aid in keeping them in position.

Now, observe what must inevitably follow from this thing. The attraction of these satellites, which have revolutions of different lengths of time, must necessarily act unequally on the fluid material of the rings, producing a series of conflicting tides, in which the force of each satellite will be so opposed to each of the others, as to produce an immense amount of friction among the particles of the fluid mass of the rings. The inevitable tendency of this friction must be to gradually decrease the rotary motion of the rings around the planet, until in the

lapse of ages that motion must be so disturbed as to bring about a disruption of the outermost ring. This will, perhaps, be more immediately caused by the approach of a conjunction of all the satellites, gradually piling up an immense tide upon one side of the ring until the rupture occurs. In such a case, the chief mass, or perhaps the whole of the ring, would assume a spherical form; possibly, a portion at the point of *low tide*, opposite the conjoined planets, might come within the attraction of the most innermost ring and *fall into it*.

When that time arrives, as arrive it undoubtedly will, the announcement will be made from the observatories on this planet that Saturn has one ring less and one moon more! The astronomer of that day may watch with his telescope, and wonder, as he beholds with his eyes, a world in process of formation from a wildly agitated chaotic mass! He may actually see God's work in the formation of a world; for the change from a state of chaos to a beautifully formed sphere may possibly be included within the limits of a day—at least within that of seven days. We may wonder and look upon such an act of omnipotent power with awe and dread; but when we reflect upon the beauty, harmony and simplicity of God's laws, would that which we have foreshadowed be any more of a wonder than the thousand acts of creation which are daily passing before us, where the hand of God is constantly shaping and tinting the flowers of the field with all their beautiful colors and forms! We may not see the aggregation of the particles of matter as they are collected and elaborated, either in the formation of a world or of a flower; but we may yet live to see a beautiful world brought out of chaotic confusion in a day, as we often see a beautiful flower open for the first time its delicately tinted leaves, and the bud become a blossom while we are admiringly beholding it.

**SOURCE OF THE SALT IN THE SEA.**—The carbonic acid of the air is constantly acting upon the rocks on the surface of the earth, thus turning them to clay, and forming carbonates with the soda, potash, lime, and magnesia set free. These are carried down as carbonates to the sea, where the carbonate of soda decomposes the chlorid of calcium of its waters, and forms common salt and carbonate of lime. This series of actions is the source of the salt of the sea, of clays, and of limestones. Organic living things do not generate the carbonate of lime, but appropriate it, when formed for them by chemical reactions; and thus great portions of our limestone rocks are made up of fossil remains. In a volume of limestone there is separated and condensed from the air a large amount of carbonic acid gas; the early atmosphere was, therefore, very dense and unfit for the sustenance of the higher forms of life, until by far the greater portion of this gas had been removed by the formation of the carbonate of lime and vegetable matter now constituting coal and petroleum.

SILVER may be substituted for platinum in a Grove's battery, as appears from some experiments lately announced to the French Academy, provided one-quarter part of hydrochloric acid be added to the nitric. A film of insoluble chlorid in this case protects the plate. The fumes of chlorine, which must undoubtedly be added to those of nitrous acid, would, however, prove, we think, a serious objection to the use of this plan.

**EXPANSION OF RAILROAD TRACKS.**—The accumulated expansion of the rails in a line of railroad 500 miles long, would amount, at the highest summer temperature, to nearly one-fourth of a mile, as compared with the length of the same rails during the coldest weather of winter.

**REGENERATION OF BONE.**—Some French savans have offered a prize of \$4,000 for the best essay on the "regeneration of the bone." They declare that experience and observation seem to indicate that amputation may be almost entirely superseded by the creation of new bone.

STATE AGRICULTURAL COLLEGE.—The site for this institution was, on the 2d inst., determined upon by the State Board of Commissioners appointed for the purpose. It is a tract of land of over 100 acres, contiguous to the grounds of the College of California, three miles north of Oakland. The price paid was \$30,000. We consider the selection a good one. There is no question that an educational institution of any kind, requiring regular courses of lectures from scientific professors should, generally, be located in the immediate neighborhood of the metropolis. It is there that the men of letters "most do congregate," where they can have ready access to the various libraries of reference, and that frequent intercourse with each other in scientific and social converse, which is necessary to preserve their powers in all their brightness. More especially is this true with regard to an institution like this in its infancy. At a distance from the capital, it would assuredly languish. It must be borne in mind that this is a "Mining" as well as "Agricultural" College. The expensive works necessary for the illustration of all branches of the first of these departments, could certainly be located to better advantage in this city than elsewhere; will, in fact, be located here, in any case, without reference to the college, and might as well be taken advantage of. As regards the second department—here will be the depot for newly invented agricultural implements; here will be extensive chemical works, and the means of preparing on a large scale any new fertilizer that progressive chemistry points out to the farmer; and here will be the center of branching railroads which can convey the class of students, with their teacher, in a few hours, to any part of the country which may at the moment offer especial facilities for the illustration of any particular subject.

At the point selected, the soil is reported good, the view magnificent, and the climate agreeable. The background of hills serves to so divert the fog-bearing air-currents which sweep through the Golden Gate, that this favored spot is left intact.

P. S.—The above was in type before the error into which the city journals were led was corrected. The location was for the Deaf, Dumb and Blind Asylum. No site has as yet been selected for the Agricultural College. As an expression of our opinion, however, we allow it to stand.

**NEW INCORPORATIONS.**—April 3d—California Sugar Refinery. Capital Stock, \$300,000; 300 shares, of \$100 each. Trustees: Claus Spreckles, Peter Spreckles. Claus Mangels, Fred. Hagemann and Henry Horstman.

April 4th—South San Francisco Dock Co. To buy, sell, lease and convey real estate at South San Francisco, and to build wharves and other improvements on the water front of the property. Capital Stock, \$500,000 in 500 shares of \$1,000 each. Directors: J. B. Knapp, Joseph De Forest, B. C. Vandal, H. B. Brooks, H. Rosencrans, John S. Hittell, William W. Neal, Thomas Anderson and Samuel Tyler.

SOUTHERN RELIEF MEETING. — A very large and enthusiastic crowd assembled on Thursday evening last at the Academy of Music, for the purpose of making arrangements for the collecting of money for the relief of the Southern people. Speeches were made by several clergymen and others, and a commission was organized to procure a subscription.

G. L. WADLEY, M. D., physician and accoucheur, recently from La Porte, Sierra county, has established his professional office at No. 23 Kearny street, in this city. We have known the doctor as a successful practitioner in his mountain residence for eight years. His Sierra county friends will be pleased to note his address in San Francisco.

“THE NATIONAL PROBLEM SOLVED!”—  
We have received a copy of a pamphlet with  
the above title.

## Weekly Stock Circular.

Of Associated Brokers of the S. F. Stock and Exchange Board

SAN FRANCISCO. SATURDAY MORNING, }  
April 6 1867

## CITY STOCKS.

We note a little more animation in city shares during the past week as compared with our reference of the previous week. California Steam Navigation Company advanced from 67 to 75  $\frac{3}{4}$  cent., and closed yesterday at 70  $\frac{3}{4}$  cent. This marked appreciation is doubtless owing to the rumored consolidation of the various opposition lines with this company. S. F. Gas stock sold to a large extent at 69 $\frac{1}{2}$ @69, s. 30. This company paid its usual dividend on 1st inst. Spring Valley Water realized \$67.50 per share, and National Insurance Company \$72.50. The San Francisco and Occidental Insurance companies declared their usual quarterly dividends—4 $\frac{1}{2}$   $\frac{3}{4}$  cent. on their capital stock—during the past week. State Telegraph sold yesterday at \$29.

Legal Tenders sold quite freely at  $74\frac{7}{8}$ @  $74\frac{3}{4}$ . At the close  $74\frac{1}{2}$  is bid, and 75 asked.

### MINING SHARE MARKET.

We refer our readers to the following tabular statement, giving the dividends paid and assessments levied by the various claims on the Comstock Lode, for the first quarter of 1867, as compared with that of 1866:

[illegible]

The foregoing table presents very interesting figures in regard to the present productiveness of seven of the most prominent silver mines in the State of Nevada. It will be observed that while a distribution of \$790,000 was made in dividends by these companies during the past three months, only \$90,000 were so disbursed during the same period in 1866, showing an increase of \$700,000 in favor of 1867. We are pleased to record the gratifying statement as to the reduction of assessments levied by the various companies located on the same lode, which show a diminution of \$243,820 for the first quarter in 1867 as compared with the same period in 1866, a reduction of more than the whole amount levied during the quarter just closed. In February, 1866, no dividends were declared by the seven companies above named, but in the same month of the present year \$256,000 were disbursed. The dividends of these companies during the quarter closing with March, 1867, exceeded the assessments levied during the same period by nine other companies, on the same lode, \$559,220, while in the first quarter of 1866 the assessments exceeded the dividends \$384,600.

Considerable activity prevailed in the mining share market during the past week.

with a very general upward tendency in prices for most leading shares. A few stocks have advanced very materially under a legitimate improvement of the several claims, while others have been influenced by a strong "bull" operation—a movement not dependent upon encouraging advices, so far as we have been able to learn, lately received from these mines. The bullion receipts during the month of March have not been as large as usual, owing to the frequent interruptions on account of the weather; however, the supply of ore is quite large, and a considerable increase in the receipts is confidently expected in the future.

HALE & NORCROSS—held at previous quotations; no sales came to our knowledge during the past week. We are informed that the operations of this company are progressing very favorably. On the 24th ult. the new shaft had attained a depth of 210 feet.

**SAVAGE**—sold at enhanced rates, opening at \$2,025, advancing to \$2,200, receding to \$2,140, and closing yesterday at \$2,170. The ore extracted during the week ending March 30th amounted to 1,524 tons, the assay value of which is stated at \$55,362, equal to \$36.32 per ton. This ore was taken from the sixth and seventh stations. The dumps at the Curtis shaft being still inaccessible for wagons, no work was done during the week, except in starting the third station.

**YELLOW JACKET**—has been sold to a large extent at greatly improved figures, rapidly rising from \$820 to \$945, then selling at \$915, and closing at \$938. We are unable to gain reliable information as to the merits of this company's mine, since reports, as usual, are very tardy in reaching the office in this city, to the great detriment of many stockholders.

**CROWN POINT**—sold at \$870@ \$895, closing yesterday at \$890. This company is still working east and west from the 500-foot station, the former drift having attained, on the 29th ult., a distance of one hundred and thirty-one feet, and the latter eighty feet. During the week ending March 29th, 589 tons of ore were taken from the mine; the previous week, 523 tons were extracted.

**GOULD & CURRY**—declined from \$500 to \$400, seller 5, and at the close sold at \$375, seller 30. The bullion receipts of this Company for the month of March amounted to \$52,878.47.

**CHOLLAR-POTOSI**—advanced from \$253 to \$271 under large sales, then sold at \$262.50 and closed at \$290, b. 10. In the Santa Fe station the ore is said to be 42 feet wide—the best quality of the deposit being about 18 feet wide, and the balance is estimated at \$22 per ton. In breasting out south, over the winze in the north end, from the first station, new shaft, the ore is 18 feet wide and it is thought will yield \$40 to the ton. During the week ending March 29th, 1,342½ tons of ore were sent to custom mills; previous week, 1,093 tons.

IMPERIAL—has been sold to a considerable extent at an advance, improving from \$230 to \$250, closing at \$246 bid. This Company has commenced an incline on the front ledge of the Holmes mine, and it is said are producing more ore from this point than can be worked at their Gold Hill mill. The Imperial-Empire shaft is now down and timbered 842 feet.

OPHR--opened at \$232, and closed at \$234. Since the first instant this Company have been steadily drifting south on the tenth level.

EMPIRE—receded from \$185 to \$166, then sold at \$174, and closed yesterday at \$175. ... BELCHER sold at \$110 to \$112.50. ... CONFIDENCE at \$33 to \$36. ... OVERMAN, \$9 to \$14. ... Late telegrams from Aurora state that rich rock is now being taken out of the Monroe claim, part of the Wide West ledge.

The aggregate sales of stocks, Legal Tender Notes, etc., since Saturday last, amounted to \$897,710.50.

**HALE & NORCROSS.**—The sixth annual report of this company has been handed us. The President congratulates the stockholders on the fact that the mine is now a dividend-paying institution. The assessments have aggregated \$875 per foot. For the year just ended, \$1,225 per foot has been returned in dividends; in one year, therefore, repaying the assessments of five years and giving a surplus of \$350 per foot, in addition to an amount of cash still on hand equal to \$333.22 per foot.

To Those Whose Interests We Represent.

While there is every reason for gratification at the circulation which this journal has already reached, we are yet well aware that there are great numbers of miners, mechanics and lovers of science to whom it might be made a source of much usefulness and profit. We feel no hesitation or modesty in urging the claims of the paper upon the attention of all for whose especial benefit its publication is intended. Being the only journal of the kind this side of the Rocky Mountains, and having a wide circulation distributed throughout all the States and Territories on the Pacific coast, and among the most intelligent and thriving portion of our people, it presents a new and valuable medium for advertising—a feature which our columns show for themselves, is quite generally appreciated.

New subscriptions will be received at a times by mail or otherwise. Those who have friends that they think might be interested or benefited by the paper, will confer a favor both upon them and us by calling their attention to this matter, and at this time. By so doing they will place us under still greater obligations to themselves, and enable us by its increased receipts, to add still more to the value of the paper. It is thus that in the growing welfare of the country and people, this journal hopes to find its due share of prosperity, and a fair reward for its efforts in behalf of science, industry and of progress.

We trust that it is needless to urge upon our readers the necessity of promptly renewing their subscriptions. The two indexes for volumes XII and XIII, which we have already published, and the 50 sample pages of reading matter, apart from advertisements, to say nothing of our numerous engravings and illustrations, speak more for the value which we give for the price of a year's subscription than we can say in this connection. For the next year we can safely promise even more. Increased experience and enlarged means and facilities will secure this. Everything that untiring industry and reasonable expense can accomplish, will be done to render the *MINING AND SCIENTIFIC PRESS* a journal which shall be creditable to the interests which it represents, and of special value to its readers.

Jan. 1, 1867.

**THE PACIFIC BRASS FOUNDRY**, is another establishment to be added to the list of recent enterprises, which are continually springing up in the mechanical line. It is situated on Fremont street, between Mission and Howard, and conducted by a company composed of working men and practical mechanics, Mr. G. E. Smith being the business agent.

## Mineral Land Law Blanks FOR SALE.

## Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

## CALIFORNIA.

## Alpine County.

From the *Miner* of March 23d: In Mogul Dist. the Leviathan show rich smelting ore. The Tarshish has recently cut into quartz. Mr. Ray is working on the Mountain lode, a continuation of the Florence, and expects to see the color soon. The Winchester company will, as soon as any suitable reduction works are up, make another trial of their ores. In Silver Mountain Dist., the Mountain No. 1, and Pennsylvania companies, whose claims are on two of the mother lodes of that district, expect to tap their veins where they will pay, before another winter.

Nitro-glycerine is to be tried in the Mowyer tunnel for blasting purposes.

The Graff Smelting company has contracted to work 10,000 tons of ore for the Morning Star company.

From the *Silver Mountain Bulletin* of March 23d: The California Illinois company are now in with their tunnel 530 ft., having made seven ft. last week. The cutting in this tunnel has been in the hardest character of rock yet found in this district.

In the Pennsylvania the lower tunnel is now in 525 ft. The rock is difficult to work, except when a seam is struck; the distance run per week varying from seven to 11 ft.—two shifts.

Operations have been resumed on the George Washington. Considerable damage had been done to the buildings of the company by the snow. The tunnel is to be extended 300 ft. on the ledge. The rock is soft and easily worked. It is expected that two months' work will put the mine in such shape that there will be no difficulty in supplying the mill with ore. The furnaces are to be changed at an expense of \$1,200. Four of the Freiberg barrels are to be removed, and their places supplied by as many Wheeler pans.

The tunnel of Mountain company No. 1 is now in 1,063 ft.—11 ft. having been run the week ending Saturday, the 16th inst.

A telegram to the *Alta* from Markleeville, April 3d, says: The Schenectady company have struck a very rich ledge in the Tarshish claim, at Monitor, 300 ft. deep. Pure silver may be cut out of the rock, and the ore assays \$500 per ton.

## Anador County.

From the *Ledger* of March 30th: William Roberts, better known as "Old Bob," has sold one-half of his quartz claim, situated on Walker's field, adjoining town, for \$10,000. Mr. Jas. Morgan of the Oneida mine is the purchaser. Work will at once be commenced on the mine.

## Calaveras County.

From the *Chronicle* of March 23d: Paul & Co., in Chile Gulch, have recently struck through into pay dirt of great richness. The tunnel is 850 ft. long, through solid granite, and cost \$30,000. The gravel at the point where the tunnel breaks through the bedrock, pays an average of \$14 to the carload, and still the main lead has not been reached.

Martin & Co. have an extensive hydraulic claim in the same vicinity, which pays remarkably well. Water is conveyed to the claim through iron pipes a distance of 1,000 ft., with a fall of between 300 and 400 ft.

The tunnel in the "Henry Guy" claim, belonging to Mr. Shaw, has been driven to a point beneath the gravel, and as soon as a streak of extremely hard ledge is gone through, a shaft will be sunk to intersect the tunnel, and operations commenced.

Diacre & Co., who purchased the old "Bob Paul" claim, are doing exceedingly well. Last week they cleaned up \$400, the result of five days work.

From the *Copperopolis Courier* of March 30th: We were shown some very rich specimens of gold-bearing quartz on Wednesday last, taken from a claim and extension on the eastern side of Salt Spring Valley, directly opposite the Gold Hunter claim. In the specimens from the main claim it was hard to tell which predominated, the quartz or the yellow metal. The lead is quite extensive, and our informant says that the lucky owners have pounded out with a mortar over \$1,000 in solid gold. The rock taken from the extension has been tested, and shows \$60 to the ton.

The San Andreas *Register* of March 30th says, the Spring Valley mill is now in full blast, and rich rock is now being taken out.

*Times* letter from Camanche, March 26th: Mr. Joseph Zimmerman recently cut a tunnel into a hill, and from the first pan of dirt prospected, washed out 20 cents. A little further in he took out a second panful of dirt, which yielded \$1.50. He then, in company with three others, took up four

claims, under the new mining laws, adopted March 10th. This discovery created quite an excitement. A great many other claims were immediately taken up in the neighborhood, some of which prospect from one cent to 25 cents to the pan, paying from the top down. There are from two to 12 ft. of gravel. Water to these claims will soon be supplied from the Mokelumne Hill ditch. There are from five to eight miles of this mining ground, some of which, a year from now, I think will pay as high as \$25 per day to the hand.

## El Dorado County.

From the *Placerville Courier* of March 30th: Three of Gaston's pans have been put into the Pacific mill. We believe they will be a success, and that those sulphurets can be made to pay. No thorough test has, however, yet been made.

Kelsey letter to same: There is a controversy between the owners of the Bald Eagle. A majority have incorporated, but a portion refuse to sign the trust deed. A lawsuit will probably result. The rock is rich, thousands of dollars having been pounded out in a hand-mortar.... Stewart, of Placerville, thinks he has struck it at Kelsey.... The Blue Ledge mill and mine has passed into the hands of Lyon of San Francisco.

## Kern County.

From the *Havilah Courier* of March 23d: The last clean-up of the Joe Walker mine yielded \$10,000 after a run of 10 days. Large as it is, this is not over the average yield of the Joe Walker. Mining interests in this county are attracting merited attention from capitalists and miners.

Long Tom correspondence of same gives these items: The Long Tom mine has been worked to a depth of 200 ft. through a mass of gold-bearing quartz, averaging in width from five to six ft. The yield cannot be less than \$20,000 per month. The company has a 10-stamp mill in operation day and night. Work on the Kirby Smith is being prosecuted with great vigor and promises a good yield. Pyle & Collins, owners of the Robert Johnson, are crushing in arastra a good quality of quartz. I am informed that \$60 per ton was refused for quartz on the dump. The Tucker Brothers and Bell are gridding away with arastras on A No. 1 quartz. Work has been suspended on the claim of French, McDonald & Co., until supplies and machinery can be brought in.

## Klamath County.

From the *Humboldt Times* of March 23d: The Red Cap Copper Mining company have shipped by the schooner Amanda Ager, hence for San Francisco, 10 tons of very superior ore from their mine at Red Cap, in Klamath county.

The Yreka *Union* of same date says: We learn that there are several claims along down the Klamath that are paying very handsomely now. We have not definite reports of the amounts taken out of different claims.

## Mariposa County.

The *Mariposa Mail* has a letter from Coulterville, with these items: Messrs. Douglass & Co., who have purchased the old Goodman & Hubbell vein, have about 30 men employed at the French mill which they have rented for a season for the purpose of testing their ores. The Maxwell Creek Mining Co., generally known as the French Co., have leased or conditionally sold their property to some parties who have entered upon and are now making arrangements to work it. Dr. McLean has purchased the Pino Blanco mine, and has had some eight or ten hands at work all winter. A rich vein has recently been struck on Skunk Gulch, a tributary of Hall's Gulch—this latter emptying into the Merced near McCahe's Flat.

## Nevada County.

From the *Transcript* of March 27th: Fifty tons of rock from the Liberty ledge, located at Eureka, has been worked in Booth & Co's arastra, at that place, and yielded \$1,500.

Same of 30th: Yesterday, in the south drift of the Star Spangled Banner mine, 230 ft. below the surface, a streak a foot wide was struck, which is nearly two-thirds gold. The ledge is six ft. wide, and this rich stratum runs through it. The rich streak was found several days ago in the south drift, and has been gradually widening and growing richer until it attained its present size and value. The gold seems to be evenly distributed, and occupies fully two-thirds of the mass.

Same of April 2d: Crosby & Co. are prospecting a ledge near McCourtney's Crossing, on Bear River. The lead, which was eight inches at the surface, became two ft. a short distance below. An arastra was erected, and the first working of the rock paid \$30 per ton.

The Last Chance Copper Mining company is taking steps to procure a patent to their mine.

Same of 3d: We understand a rich strike was made on Monday in the Mattingly lead. The incline is now down 190 ft. below the surface, and the ledge is large and well defined. The rock contains a large amount of free gold.

A party of Cornishmen have contracted with the Star Spangled Banner company to put up a "huddle," such as is used in the mines of Cornwall, below the pans. They will work it for four months, and give the company one-fifth of the net proceeds.

From the *Gazette* of April 1st: The mill of the Eagle company, on the California ledge, situated half a mile from town, was started up for regular work on Saturday last. It has 10 stamps, five Bradford's separators, and galvanized copper plates. The company has out now to commence on between 300 and 400 tons of rock.

From the *Grass Valley National*: Griffin, Larrison & Co., on Indian Creek, five miles east of Grass Valley, have struck a bed of gravel from 80 to 90 ft. in width, supposed to be an extension of the celebrated "Blue lead." The company have about 1,000 ft. of ground.

## Placer County.

From the *Grass Valley Union* of March 29th: The Ione company are to sink their shaft 100 ft. deeper.... Work is about being commenced on the Union Jack.

EXCELSIOR.—The *Nevada Gazette* of April 3d has the following: Frank F. Adler, who arrived from Meadow Lake on Monday, brought the amalgam from 15½ tons of ore from the Golden Eagle ledge, and crushed at the company's mill. According to previous reports, the yield of the last crushing will be \$24 per ton. The California company have struck their ledge at a depth of 90 ft., and are running through the foot-wall. The mill of the Mohawk and Montreal company will be completed and in running order about the middle of this month.

From the *Herald* of March 30th: The Harpending mine is proving very rich. They made a four days' run this week with 20 stamps, and cleaned up 500 ozs. of amalgam, which will yield \$3,500 in gold. In a few days more they will commence running their other 20 stamps.

Captain Mallett, after a three weeks' run with five stamps, cleaned up on Saturday evening last five pansfull of amalgam, which he has not yet retorted.

From the *Stars and Stripes* of March 27th: Mr. Rousch recently purchased one-half of the "Old Rip" claim at Bath, paying therefor the sum of \$10,000 cash. This purchase makes him, we believe, the sole owner of the claim. We are informed that he intends to put up a mill at an early day.

Dr. E. B. Harris has bought the Ambruster claim, on Georgia Hill, near Yankee Jim's, for \$10,000, after having had, by previous agreement, control of the claim for 16 days. There is a five-stamp mill near the mouth of the tunnel. The Ambruster is an old hydraulic claim. The bank presents a face 60 or 80 ft. in height, and perhaps 120 to 150 ft. across. The claims have a frontage of 300 ft., and run back to the center of the hill. The streak of blue cement is four ft. thick, and the lower ledge is 10 ft. above the bedrock. Several pans of dirt were tried while we were present, yielding from 20 to 25 cents per pan. This cement would pay fairly without crushing, but as it is easily crushed, and two Chinese drifters have been able to keep five stamps at work, it must, if it holds out, pay enormously.

The editor had visited the Dewey claim at Bath (or Sarahsville). The main tunnel is 2,000 ft. long, and is so straight that one standing at the back end can see the mouth. The "pay dirt" is a streak of cemented gravel about 3 to 3½ ft. in thickness, which is about 100 ft. above the bedrock. It pays \$5.50 per ton. The claim has been prospected throughout a length of \$2,000 ft., and a breadth of 200 ft. During the past year, the aggregate receipts were a trifle over \$105,000, and the aggregate expenses a little less than \$65,000, leaving \$40,000 to be divided between the four shareholders, and a safe surplus in the treasury. The price paid for the claim by the present owners was \$11,000 each. Their names are as follows: Thomas Rea, Judson Wheeler, W. A. Freeman and A. Brece, the latter having been one of the old company.

From the *Dutch Flat Enquirer* of March 30th: At Dutch Flat and Gold Run, within a circle of a radius of a mile and a half, there are about 45 hydraulic claims now worked. The daily product is not far from \$5,000.

Colfax letter to same, says that Walker & Co's ditch is completed.

## Plumas County.

From the *National* of March 23d: We learn that the Crescent company cleaned up, last week, after a nine days' run, twice as much as at any former time.

Dutch Hill is now about as lively a camp as there is in the county. Zearing has

cleared about \$5,000 on the old Cumming's claims since last July. The old Dutch Hill company have done well the past year. Meehling & Co., Bowers & Co., Stanley, Benham & Co., Underwood, Bryan & Co., have all struck good prospects within the last three weeks, obtaining as much as two ozs. to the sack. Brewster & Co. have a large amount of very rich pay dirt thrown up at Red Rock, and expect to make a big clean-up.

Rich diggings are being found on the high benches above the river, at Cariboo, on the North Fork. Morris & Co. have commenced working the river bed. Ferguson, Tripp & Co. are doing well in the hill. The snow is all gone on the river about Cariboo Junction. Tom Orton's claim is paying \$10 to \$40 per day to the hand. E. R. Drake's claim, for six days work, paid \$160 for one hand. Lynn & Cook have been making big wages, getting \$900 out of one small crevice.

## Siskiyou County.

From the *Yreka Union* of March 23d: The winter just passed has been an unusually favorable one for ground sluicing, there having been a large amount of water and not much severe freezing weather. The miners on Humbug, Deadwood and Indian creeks, will be able to wash later in the fall than usual; at Oro Fino and Mugginsville, probably a month or six weeks longer than in previous seasons. Such localities as Greenhorn, Yreka Flats, Hawkinsville, Cottonwood, Hungry Creek, etc., usually short of water during the later months, will hail with satisfaction a more ample supply of the indispensable element. Altogether, therefore, we regard the prospects for a good mining season the coming summer as peculiarly flattering.

## Sacramento County.

From the *Folsom Telegraph* of March 30th: On Saturday last, Geo. Hamilton and partner, who have been prospecting at Alder Creek and vicinity, sunk a shaft on a bench of land about half a mile south of Alder Creek Station. At the depth of 11 ft. from the surface they struck gravel which prospected from 15 to 50 cents to the pan; the news of the discovery soon spread around, and miners hurried from every direction. At this time at least 2½ miles of ground has been staked off, upon which about 100 shafts are now being sunk. The discoveries extend to Buffalo Creek, and embrace a district about three miles in extent, running south and east, the entire adjoining lands in both directions never having been prospected, and the field is open to all. On the Natoma Water and Mining company's land no rent is charged, and miners are invited to prospect and work their discoveries; all the company ask is to sell their water, of which they have an ample supply.

We are informed that new and extensive diggings have been discovered in the vicinity of Mississippi Bar, on the San Juan Grant, two miles from Folsom.

## Yuba County.

From the *Marystown Appeal* of March 31st: A miner named Swett, one day last week, discovered a new quartz lode which promises, by prospects, to be rich, above Frenchtown, near Evans' ranch. Several parties have located on the ledge.

Same of April 2d: Mathew Smith and others have recently begun work on a ledge about one mile this side of Timbuctoo, on Filmore Hill. This ledge was taken up about a week ago and it promises to be of great value.

## COLORADO.

From the *Times* of March 5th: Wm. J. Barker, on No. 5 east, Dorchester lode, in Russell district, is now about 75 feet deep. An assay gave \$46.40 per ton. The crevice is over four feet wide, with 16 inches of solid iron.

The King company own three and four east, and have a shaft 60 ft. deep. The Discovery, and Nos. one and two east, are owned by Kuhster & Cave, who have a shaft 80 ft. deep, with a splendid crevice of iron.

Einchar & Co. are working the Colorado Exchange lode, a short distance west of the Dorchester, and have a fine show of iron.

Yesterday the Gunnell company shipped 181 ozs. of gold, this last week's run. The Alps company shipped 105 ozs., all of which was gotten out of the week's run, with only a 12-stamp mill, in Leavenworth Gulch. The Black Hawk company's run for the week was 194 ozs.; the Smith & Parmelee, 82 ozs.; and the Kimber mill 57 ozs.

Both the Keith and Dubois mills are running—the former on ore from the Bates lode, and the latter from the Bohall.

Messrs. Hinds & Shumer have resumed crushing ore from the Adeline lode, Central City Dist. They have been timbering up for some time past. The last run from six cords of dirt mixed with quartz, yielded 57 ozs. and 13 dwts.... Capt. Pritchard is down 130 ft. on the Whalen, and said to be

getting out rich ore. . . . An assay from average ore at a depth of 11 ft. on the Joe Johnson lode, Clear Creek county, gave \$118.15, gold, and \$49.73, silver, per ton.

A. C. Bennett has "struck it" in the Portage lode. Specimens of the quartz from a depth of 18 ft. showed beautiful wire gold running through it. . . . No. 2, Gregory, having broken their pump, will be delayed for a week.

#### IDAHO.

From the *Owyhee Avalanche* of March 23d: We have it from parties whose correspondence enables them to speak knowingly, that the sum of \$20,000 has been raised to develop the extension of the Poorman, sold this winter in New York.

In the Vulcan the tunnel is advancing, and the ore changing. It is believed to be rich, and is two ft. thick.

L. J. Lewis, of the Cosmos company, has purchased all the interest of John McMahon in the Silver Cord mine, together with his surface property. The amount of ledge purchased was 234 ft., 30 ft. of which will yield near \$1,000 per ton. Mr. L. will work it this summer. The richest ore will be shipped to New York. The belt of golden ore has widened to four ft. within two weeks.

A quartz mill will be put up this summer at the head of Blue Gulch. It will be supplied with ore from the Oneonta ledge, which tests from \$45 to \$300 per ton.

A Grantsville (Lemhi) correspondent of the *Montana Post* writes thus: Messrs. Smith, Prince & Co., who have been prospecting some time below the Idaho Dist., have struck a new gulch, which they have named Mackinaw Gulch and Prince's Dist. They report from 18 inches to two ft. of black muck on top, with colors all through it, and six ft. of gravel, with from one to three cents to the pan from top to bottom.

R. B. Royer and others have procured a lease of the New York ledge—just west of the Oro Fino—and are at work on it. They intend supplying the Webfoot mill with ore from it, as soon as winter ceases. The ore of this ledge is said to pay an average of over \$40 per ton.

An assay of ore from the Leviathan ledge, in Flint, gave at the rate of \$1,049.34 per ton in silver, with only a trace of gold.

The Rattler is the name of a new four-ft. ledge discovered in Flint Dist. Free gold is visible in the rock.

Rocky Bar correspondent of *Statesman* says: Mr. Joe Daly sold his 200 ft. on the Atlanta to F. M. Clark for \$10,000. Mr. Clark is in the East and will return soon, and it is stated that he has two mills purchased for the Yuba country. Yesterday, the 11th, Mr. Lee Mothershead brought for the Monarch Gold and Silver Mining company, of Indianapolis, Indiana, 200 ft., undivided of 800 ft., being the second east extension on the Atlanta, and paid Mr. J. M. Downing and C. Simmons therefor \$20,000 in greenbacks. The Atlanta is from 10 to 40 ft. wide, and the whole of the quartz will pay; the very poorest will pay over \$30 per ton. There is a streak from eight to fifteen inches wide that is equally as rich as the Poorman. Recently 200 lbs., after having been crushed in a hand-mortar, and put through a Varney pan, yielded 32 ozs. of bullion, worth \$4 per ounce. Remember that the Atlanta crops out, and has been found for more than a mile.

From the *Leviston Journal* of March 22d: Hunt, express messenger, arrived on Tuesday. He reports all business locked up at Warren's by the frost and snow, and the miners in camp mostly spend their time in their cabins. The snow averages about seven ft. in depth in Warren's Basin, and from that depth to 15 ft. on the mountains.

The work on the Lidell & Hapster tunnel is suspended, owing to some misunderstanding between the contractors and the superintendent.

The cold has interrupted, to some extent, the work on the ditches and flumes along the Salmon river, though the work is progressing. Mining for the two weeks past on the river has been somewhat checked by the cold, though never has been entirely suspended.

#### MONTANA.

From the *Post* of March 16th: The Hawkeye (Postlewaite's) mill, cleaned up on the 10th instant, from 5½ days run, 345 ozs. of retort; value, \$6,208.25, coin. . . . We saw the other day some splendid specimens from the Lucas lode, in Alder Gulch.

Letter to same from Jefferson City, March 9th, says: The Argentine and Axe lodes continue to sustain their reputation. The Gregory lode is every day giving more and more satisfactory evidence of its wealth. The shaft is now 130 ft. in depth, the crevice 11 ft. wide; all the ore has been saved, and already there is mineral enough excavated to occupy a mill several months.

Letter from Beaver Town: The old cop-

per mine is not played out yet. O. W. Carpenter has commenced work upon it. . . . The Casket lode has a five-ft. crevice at the depth of 16 ft. A tunnel is being driven into the hill to strike it.

Letter from Summit: Two or three companies are at work upon the Oro Cache, and taking out good ore. The Excelsior company are about starting their tunnel for the John How lode.

The Scranton mill is not running at present. There is not much doing in the gulch. The Harris Bros. have run their tunnel into Eagle Hill 375 ft. The greater portion has paid well. Layton & Wildman's tunnel is in 50 ft., and not through the rim rock. T. L. Miles & Co. have got into pay dirt, and are taking it out, but not washing it. It prospects well.

Boardman's tunnel, running from claim No. 17, on the Kearsarge lode, is 17 ft. in. A. A. Nasler & Co. are in 196 ft., after the Butler lode. The Lucas company are taking out some excellent ore.

Letter from Red Mountain, Highland District: Mansfield works four men, and averages \$700 per day. On the Balaratt Quartz discovery, a tunnel 160 ft. in length has tapped the ledge at a depth of 45 ft. The ledge is 28 ft. in width, and prospects splendidly in free gold. Three arastras will be completed by the 1st of May. On the Golconda discovery, a tunnel 100 ft. in length has been run.

Wind River is, after all, to be again prospected this summer. A portion of the Standifer party found five cents to the pan of gravel, but afterwards got lost in trying to rejoin the main body, finally reaching Fort Smith.

From the *Helena Gazette* of March 9th: The Alabama lode, at the head of "Big Indian," five miles from this city, has a shaft 90 ft. deep, and a well defined nine-ft. crevice. Some fine specimens of the rock are now to be seen in town.

#### OREGON.

From the *Jacksonville Sentinel* of March 16th: Late reports from Eastern Oregon give information that rich gold mines have been discovered some 70 or 80 miles south of Auburn, Baker county. It is said that as high as \$50 a day to the hand has been obtained. This is confirming the long talked of report of rich gold mines being discovered by the immigrant who came to Oregon on the "Meek Cut off," in 1848.

#### NEVADA.

From the *Virginia Tresspass* of March 26th: This morning, Billy Sterman arrived direct from Black Rock. He brought with him a four-mule team laden with ore, which we presume is to be reduced at the Ophir mill, and assays from which show silver to be contained therein as much as \$2,650 per ton. The supply of ore seems to be inexhaustible, and a number of mills are to be erected there this season.

From the *Aurora Union* of March 23d: Mr. C. Arnold struck a very rich vein of quartz on Last Chance Hill several days since. The ledge was claimed as a portion of the Wido West mine, although we believe the difficulty has been settled.

Letter from Wilson's Dist. to the *Times* of March 13th: The Wilson ledge varies in width from six to eight feet on the surface, and has been found rich in free gold a distance of more than a mile. A crushing of the rock taken from the surface, worked by simple pan process, yielded \$40 to the ton, and there are thousands of tons accessible. A tunnel some 300 ft. long is now being run for this ledge, which will soon be completed.

The Wheeler, a continuation on the opposite side of the cañon, is the second ledge located. A great number of claims have been taken up. A lot of rock recently worked at Dayton yielded at the rate of \$109 to the ton.

The Mountain View is larger than either, being from 40 to 60 ft. wide, and traceable for several miles. It yields from \$30 to \$40 per ton at the mills, and the companies having ore on the surface are offered \$20 per ton for it at the dump.

#### Humboldt.

From the *Register* of the 23d: The "Fifty-six" mine, on the Humboldt river, at Lassen's Meadows, was discovered in 1856, and claimed by the discoverer and his party after the Washoe excitement in '59 commenced. It has remained, however, undeveloped, until last fall, when a company bought it up entire, and commenced work in earnest. They have now a very large, well-defined lode, and are piling up the ore at the mouth of their tunnel by the ton. Its proximity to the railroad and the river, and its desirable location otherwise, together with its large size and rich quality of ore, makes it a valuable property.

#### Pahrnagat.

The following is from a private letter received at Salt Lake, from Logan Springs, March 4th: Everything is looking up. The lodes which are being worked upon all look well. The weather is splendid. Mr. Raymond's 10-stamp mill is now at Hicko; Conger's mill is at Logan. Bidwell's mill will be built at Hatfield's Ranch; there is plenty of water there now. About 100 tons of very rich ore has been taken out of the List lode, and it continues to look well.

#### Reese River.

From the *Reveille* of March 22d: Three bars of bullion, valued at \$2,774.60, from the mill of the Twin River Co. came in yesterday.

Same of 23d: Ore for reduction is coming in from Reveille Dist. Six tons, from 13 locations by Brobant, Kellogg and Henry, is on the way.

Mr. John Frost, of the Manhattan Co., is developing its North Star mine handsomely. In the level to the west the vein has assumed extraordinary proportions. They do not select the ore, but work the entire mass. Assays of the pulp yield, we are told, over \$300 per ton.

Same of 25th: We were yesterday shown a letter from Milk Springs Dist. The Bismarck ledge was particularly mentioned as showing handsome ore a few feet below the surface. They are taking ore out of several ledges which is to be brought here for reduction.

We learn from Smoky Valley Dist., that the Commercial Co's tunnel is now about 400 ft. long, and it is calculated that the ledge will be cut in another 100 ft.

In Palmetto Dist., 30 miles south from Silver Peak, the ore from the bottom of the Kentucky shaft assays from \$700 to \$800; and it is estimated that the whole 7-ft. vein will work \$100 to the ton.

Same of 26th: The latest achievement of our mines is that of the little Timoke on Lander Hill. Its superintendent, W. F. Leon, sent to the Keystone mill for reduction 50½ tons of first-class ore, which yielded the sum of \$18,840.20 in silver bars between 850 and 900 fine. This was at the rate of \$373.15 per ton.

Same of 27th: Three bars, worth \$3,077, came in yesterday from the mill of the Twin River company. . . . The Knickerbocker mill, near Ione, sent in to-day for assay 3,237 ozs.

A letter from Reveille Dist., says the engine of the Rutland mill has been set in motion, and the result of the trial was satisfactory. The pans had reached Hot Creek, about 35 miles northwest of Reveille.

#### Washoe.

[In the Stock Circular, in another portion of this paper, will be found late mining news from this district.]

From the *Territorial Enterprise* of March 27th: The large shaft now being sunk by the Empire and Imperial companies at Gold Hill, has reached a depth of 835 ft. A considerable amount of water is coming in at the bottom of the shaft.

Same of 28th: There will undoubtedly be quite a rush this spring to the new mines at Silver Bond. Parties are already leaving this city for the land of promise almost daily.

Same of 30th: The Sierra Nevada mill will be started again in a day or two at farthest, with an engine of 100-horse power. The water in the shaft is 250 ft. deep; yet it is expected that the mine will be freed from it within three weeks.

Two assays from the O'Reilly lead gave \$26 and \$37 per ton.

From the *Tresspass* of March 26th: We learn that the Ophir company have cut their ledge at the 10th level, in the east drift, 75 ft. from the shaft.

Yesterday, at one o'clock, the members of the Miners' Union, to the number of 500, went to the Empire mine in a body, and demanded that all men at work for less than \$4 per day be discharged, or their wages raised to the standard price. The demand was complied with.

Same of 28th: We observed, yesterday, that the Chollar-Potosi company had a force of men at work on A street, filling up the old Potosi mine, with waste rock from the Chollar croppings, in order to keep the mine from settling, and make it safe for the miners at work below.

Same of 30th: The following is a statement of the amount of bullion shipped during the past week: From the office of Wells, Fargo & Co., in this city, there were shipped 3,605 lbs. of assayed bullion, valued at \$103,436.18; from their office in Gold Hill, 2,249 lbs., valued at \$91,232.96.

The *Gold Hill News* of March 28th says: A company of ten hardy prospectors left Gold Hill to-day for the Goose Creek mountains, high up the Humboldt river, to hunt gold or silver ledges. They go well provided with provisions and ammunition, and each man has a Henry repeating rifle.

#### California Petroleum.

At the meeting of the California Academy of Natural Sciences, held on Monday evening, April 1st, an interesting paper was read by the Secretary, entitled:

"On Naphtha and Illuminating Oil from Heavy California Tar (Maltha); and on the Probable Origin of Petroleum."

By PROF. B. SILLIMAN.

In this paper the author gives the results of certain experiments, recently made under his direction upon heavy "surface oil" from Santa Barbara county, with a view "to prove whether or not illuminating oil of good quality could be obtained from the distillation of so dense a body." He states that "the crude oil was very dark, almost black, transmitting yellow brown light in thin films. At ordinary temperature (60° F.) it is a thick, viscid liquid, resembling coal tar, but with only a very slight odor. Its density at 60° F. is 0.980, or 13° Baumé. It retains, mechanically entangled, a considerable quantity of water, which is neutral in its reaction."

From this substance he obtained, by fractional distillation, naphtha, and a series of light and heavy oils, varying in specific gravity from 760 to 918 at 60 degrees F.

The light, or illuminating oil, from two of these experiments, "after treatment with sulphuric acid and soda in the usual manner, acquired an agreeable odor, a light straw yellow color, and burned as well in a lamp as good commercial oil."

With respect to the heavier oils, he says: "No paraffine could be detected by refrigerating the heavy oils obtained in these distillations in a mixture of salt and ice. It is no doubt the absence of this body from the series of products obtained from the California oils generally, that accounts for the illuminating oil burning well at a density considerably below the commercial standard for oil obtained from Pennsylvania petroleum—a difference enhanced also by the absence of any considerable quantity of light naphtha. The lubricating oils of this series, likewise free from paraffine, retain on this account their fluidity at low temperatures."

He adds: "The light oils obtained in this series of experiments correspond respectively to 12.96, 14.56 and 18.96 per centum of the crude oil. The total commercial products are about sixty per cent. of the crude body, which also yields sufficient coke to supply the fuel required in the distillations."

Upon another important, and heretofore disputed point respecting the character of the California oils, he speaks as follows:

"It is evident from these experiments that heavy hydro-carbon oils, containing no naphtha, are convertible into oils of the naphtha series under the action of heat by molecular transformations, the excess of carbon being left behind as coke; each successive distillation eliminating a new but always a diminished portion of carbon. It may therefore be confidently affirmed that even the heaviest of the California hydro-carbons belong to and are derivatives from the petroleum series. The transformation of light oils into denser products ending with tar, like that which is the subject of this research, results not, as has been assumed by some, from the addition of oxygen producing an oxidized body; but, on the contrary, by the removal of successive atoms of hydrogen in the form of water, thus leaving the carbon in excess; that excess being left behind in the form of coke when the crude product is distilled."

On the question of the commercial value of the California petroleum, he speaks of the immense supply of oil from Pennsylvania as having "so far exceeded the demand of the markets of the world during the past year, that the price of the crude product does not return the cost of its production"—i. e. in Pennsylvania. He suggests, however, the probability of the California hydro-carbons possessing a value in their crude state as a fuel, a probability which is rendered stronger by the present low price of petroleum, as well as by the excess of carbon contained in these heavier hydro-carbons, and by the comparative scarcity of good fuel in California.

The paper closes with an exhibition of certain recent theories and experiments, by Daubrée and Berthelot, distinguished French chemists, the object of which is to show that the combinations of carbon and hydrogen, which form the different series of hydro-carbons known to chemists, may be effected without the aid of either vegetable or animal life—i. e. in a purely mineral way; and the fact is noted that the experiments here described, taken in connection with those of Berthelot and Daubrée, show the possibility of the derivation of the entire series of hydro-carbons from the single radical acetylene.

The paper was accompanied by samples of the oils, which were deposited in the museum of the Academy.

**American and Foreign Patents.**—Letters Patent for Inventions can be secured in the United States and Foreign Countries through the Mining and Scientific Press Patent Agency. We offer applicants reasonable terms, and they can rest assured of a strict compliance with our obligations, and a faithful performance of all contracts. For reference, we will furnish the names of numerous parties for whom we have obtained patents during the past two years.

## Canvassing Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting our Agents in their labors of canvassing, by lending their influence and encouraging favors. We shall send none but worthy men.

**Mr. A. C. Knox**, is our city soliciting and collecting Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office.  
San Francisco, Jan 11th, 1866.

**Mr. L. W. Felton**, is an authorized agent for this paper at Portland, Oregon. Dec. 1, 1865.  
**Mr. E. L. Smith**, is duly authorized Agent for this paper, February 25, 1867.

**Mr. Geo. P. Fitts** is a duly authorized agent for the Mining and Scientific Press, March 23, 1867.  
**Mr. J. M. Quay** will act as agent for the Mining and Scientific Press from this date, March 23, 1867.

## Notices to Correspondents.

**AN OLD QUARTZ MINER**, of Averill, Nev., in the course of a very complimentary letter, alludes to the notice in this journal of the experiments made in the Chile mills, in our publication of the 16th ultimo, and justly observes that to make such reports entirely satisfactory, it would be well for those making them to state the value per ounce of the amalgam obtained from each mill, with the amount and value of the amalgam from the battery, rifles and copper plates. He further adds: "That some combinations of argentiferous ore, under excessive or continued trituration, while it will afford largely of amalgam, may be of such a very inferior quality, as to be of no great advantage, after all." Our correspondent also states that many experiments made by himself and others, in early times, produced in amalgam, results quite as astonishing as those reported; but when figured in dollars and cents, was not very advantageous.

**MILLER**.—You are right about the dangerous nature of the use of lead for mending mill-stones, or filling up cavities in their faces. The terrible calamity recently visited upon a whole neighborhood in the State of New York, in consequence of such a practice, should serve as a warning never to use lead in any such case. A good substitute is melted brimstone, mixed with sand. Pour the mixture into the cavities while hot, and it will be found to "set" very firm and be sufficiently hard as to answer quite as good purpose as lead, without any of the evils resulting from the use of that metal. Although not embraced in your query, you will find an excellent hint, with regard to the "ventilation of mill-stones," in our last week's issue.

**FARMER**.—The idea of accumulating power by windmills has recently been quite fully discussed by the Farmer's Club connected with the American Institute of New York. There is no doubt that power can be thus accumulated on the principle of clock-work. But it is necessary, especially here in California, where we can almost always depend upon regular winds day after day? A good windmill can be advantageously used on almost any farm of any considerable size, for various purposes, besides pumping—such as turning grindstones, driving churns or washing machines, turning lathes, etc. If power is to be accumulated, the best way would probably be to accomplish it by raising water into an elevated reservoir. The idea is not new. It has been in use at the East for fully fifty years.

**H. C.**—Green logs, when used for water-pipes, will sometimes clog up without the admission of any foreign substance; but not often. Small pine trees, which are cut down and bored and put underground immediately, sometimes get filled up with gelatinous, semi-transparent matter, similar in appearance to the "mother" of vinegar. The substance arises from an exudation from the wood. A prevention would be to season the logs a little before putting them under ground; or, as that might check them and cause them to leak, when put under pressure, draw a hot iron, or send a light blaze through the bore, which will have the same effect as seasoning.

## J. Ross Browne's Report.

Through the unpardonable negligence of somebody, only three or four copies of the report of Mr. Browne, upon the mineral resources of the States and Territories west of the Rocky Mountains, have yet found their way to this coast, although they should have been received here a month or six weeks ago. Even the Commissioner himself has, or had not a few days since, received a copy. The one before us having been received by Professor Silliman, has been kindly loaned for perusal. It comprises a volume of 321 pages, presenting quite a comprehensive and suggestive account of the mines and mineral resources of the Pacific slope. That it is complete or without errors cannot be expected, when the reader bears in mind the limit of time allowed, and the lack of the facilities within the reach of the Commissioner for its preparation. That fully as much has been accomplished as could reasonably have been expected, must be apparent to every intelligent person who examines it. It has evidently attracted much and quite favorable attention at the East—so much so, that the extraordinary number of 100,000 copies has been ordered printed, and a new appropriation of \$15,000 made for a continuance of the work another year. The report, as a whole, presents the fullest, most complete and most reliable account of the past history, present condition and future prospects of our mines and mineral resources any where attainable—no other comprehensive effort of the kind, in fact, having ever been made. Of course, the Commissioner has been unable to collect in person but a small amount of the facts which he has spread before the public; but he has employed about the best assistance within his reach—albeit that aid has in some instances not been rendered with that care and correctness which is desirable, or which, perhaps, might have been expected. A future report, aided in its production by additional experience, and by a more general and careful comparison of facts and opinions, will, doubtless, correct the few errors of the present production, and greatly increase the value and correctness of its successor. We shall endeavor, in future numbers, to give our readers the benefit of such information within the report as may be of special value to them, and point out such errors as it would be well to have corrected. For the present we can merely give a brief enumeration of the various topics taken up in the order of their occurrence:

Section 1st contains a historical sketch of the discovery of gold and silver at different towns and places on the Pacific slope.

Sec. 2d is devoted to a brief description of the geological and mineralogical features of California. This section was chiefly prepared by Mr. Ashburner of the Geological Survey.

Sec. 3d and 4th give a topographical sketch of Nevada, its prominent mineral characteristics and resources, with statistics of its past mineral yield, processes, cost of working, etc.

Sec. 5th is devoted to the discovery and progressive development of the copper interest of the Pacific coast. This subject is quite freely treated, and furnishes the only general paper of any considerable value which has ever been published on this important branch of California industry. It was prepared by Mr. H. C. Beuett of this city.

Sec. 6th is devoted to the quicksilver mines and their statistics.

Sec. 7th gives the history of the discovery and process of working our borax and sulphur deposits; concluding with a brief account of the tin mines of Temescal.

Sec. 8th is devoted to the population, main divisions, altitudes, climate, timber, and other general resources of the mining regions.

Sec. 9th consists of Prof. W. P. Blake's annotated catalogue of minerals found west of the Rocky Mountains.

Sec. 10th and 11th are devoted to the local mining customs, laws, difficulties and benefits therefrom, etc.

Sec. 12th contains a list of the most important works published in reference to the geology, mineralogy, and metallurgy of the

Pacific coast, and comprises a most valuable chapter for reference.

Sec. 13th is devoted to a further consideration of the population and agricultural resources of the mining region, with tables of distances; Edmund Randolph's address before the Pioneer association of this city on the history of California, and J. W. Dwinelle's address on the acquisition of California, etc., delivered before the Pioneers.

## California Railroad Constructor.

We have several times alluded, at considerable length, to the important California invention of W. D. Robertson, of a mechanical device for simplifying and facilitating the laying of railroad tracks, after the road has been graded. Mr. Robertson has greatly modified the machine, from the model which we described in our issue of November 10th, 1866. He has laid aside the wheel by which he then placed the timbers in position, and made several other important changes, which further reflection has suggested.

The machine which has now been constructed, and which may be seen near the San José Railroad depot, consists of a heavy frame structure, sixty feet long by ten feet high, and ten feet wide, with trusses, struts and tie-rods, giving it very much the appearance at a distance of an ordinary railroad bridge.

The framework overhangs the forward wheels about one-third of its length, in order to allow the work of track laying to progress in advance of the wheels, which, of course, advance only as fast as the track is laid. The proper balance is secured by placing the heavy machinery near the rear. In front of the machine is a scraper which smooths down any trifling inequality which may have been left by the graders. As fast as the ground is prepared the ties are pre-seuted, laid down in place, firmly bedded and made ready for the iron rails, which are brought forward in pairs from the rear, one on each side, and readily swung into place from the forward overhanging part of the machine. The chains are placed upon the rail ends as they are being brought forward. The spikes in the present machine are driven by hand, after the machine has passed on, although even that may be done by machinery. The machine moves regularly on as the work progresses.

At the commencement of work, the rear portion of the machine is loaded with ties and rails, which are supplied and replaced from freight trains which follow the machine as fast as the work progresses. The ties are carried to their place by two endless chains which revolve with the progress of the machine. Small spikes are attached to these chains at intervals corresponding to the distances which it is desirable should be left between the ties. The ties are merely thrown upon these spikes, and carried forward over the heads of the workmen and are regularly deposited upon the grade as fast as the work progresses. The machine readily adjusts itself to up and down grades or to curvatures, down to a radius of 200 feet.

It is estimated from experiments already made with this machine, that with a 10-horse power engine to drive it, it will be able to lay from one-fifth to one-quarter of a mile per hour with sixteen or eighteen men. It is capable of being run night and day, wet or dry, as the men may be constantly under cover. It is the opinion of the inventor, that with three shifts of men he can with this machine do six times as much work as three times the same number of men can do without its aid.

The experimental trials thus far appear to have fully established the success of the machine. Some of our heaviest capitalists have taken an interest in the same, who are determined to see that it has a fair trial. This is as it should be, and speaks well for the enterprise and patronizing spirit of our moneyed men, some of whom are ever ready to lend a helping hand to genius, especially when directed to the development of the mechanical interests of our growing Pacific Empire.

## MECHANICS' INSTITUTE—SUTRO TUNNEL.

The Special Committee, consisting of Messrs. Wm. J. Lewis, Arch. Cooper and P. M. Randall, appointed to investigate the subject of the Suto Tunnel project, made their report, at the regular meeting, held on the evening of the fourth inst. The report closed with the following resolutions:

1st. That the Comstock lode is a vein of extraordinary value, presenting every feature of permanency and continuance in depth much further than mining work can ever be carried.

2d. That experience in all mining countries shows conclusively that the difficulties in drainage and ventilation limit the depth to which mines can be worked, and whenever attempts have been made to work them below this limit, without the aid of adits or tunnels, the result has been disastrous to the owners.

3d. That the proposed tunnel will, by affording good ventilation, diminish the temperature and greatly improve the sanitary condition of the miners.

4th. That the Comstock lode must have a drain tunnel, or the mines must be eventually abandoned.

5th. That the proposed Suto Tunnel is a work entirely feasible, and offers no unusual mechanical difficulties whatever, and we believe it can be constructed, with proper energy, judicious management, and sufficiency of capital, in from three and a half to four years, at a cost of about \$2,500,000. But if the cost should, by any contingency, reach even \$10,000,000, necessity demands its construction.

6th. That the rights granted the Tunnel Company, the contracts made with the mining companies, and the chances of discovering valuable mines, must make this enterprise one of the most promising undertakings ever projected on this coast, and one offering extraordinary inducements for the investment of capital.

7th. That by means of this tunnel a permanence and importance will be given to the mines on the Comstock lode which can hardly be realized now; that the produce of bullion from the mines may be doubled, and even tripled, exercising a most beneficial influence upon the commerce, the industry and resources of San Francisco.

8th. That every citizen of California and this coast at large, who has the future welfare of the Pacific States at heart, should lend a helping hand and encourage in every way and manner the execution of this great work.

9th. That, recognizing the influence which the production of the precious metals has upon the general welfare of the nation in increasing its taxable property, and consequently its revenue, we respectfully solicit Congress to give liberal aid to the work in such manner as in their wisdom they may deem proper.

10th. That we fully recognize the foresight of A. Suto, Esq., in projecting this great work, and highly appreciate the intelligent manner in which he has presented to the public the importance and necessity of this enterprise.

The report was an elaborate and valuable paper. It was unanimously adopted. We hope it will be published, as has been proposed.

**MACHINERY FOR MONTANA.**—The Miners' Foundry is building six Wheeler pans for this distant territory, which is another evidence that the mining machinery manufactured here is beginning to be more and more appreciated abroad, and if we may judge from inquiries from that quarter, in regard to the cost, character and capacity of our mills and machinery, as compared with the Eastern manufacture, they are waking up to some extent to their true interests. Chicago has a little advantage of us in point of cheapness of transportation, perhaps some as to material, and can deliver them a certain class of machinery at a less price; but for a first-class article that will accomplish the most work, with the least cost in a given time, the Eastern market cannot compete with this; at least such is the belief of some of our most skillful foundrymen. In this connection, we will state that the Miners' Foundry have just erected a new and large boiler shop, giving them increased facilities for the construction of boilers of all sizes, from the smallest stationary boiler to the largest ocean steamship.

(Reported for the Mining and Scientific Press.)

## California Academy of Natural Sciences.

## REGULAR MEETING.

MONDAY, April 1st, 1867.

Prof. W. P. Blake in the Chair.

Forty-nine members present.

J. D. Farwell, Samuel S. C. Swezey, Frederick Madge, D. J. Littlefield, Archibald Cooper, F. Berton, Bernard Marks and Samuel Pillsbury, were elected resident members.

Mr. Stearns reported an invitation from Maj. J. T. Hoyt for the Academy to visit Angel Island next Saturday. The invitation was accepted with thanks, and notice given for members to meet at the Society rooms on Saturday morning at 9 o'clock.

**Donations to Cabinet.**—Mr. Lorquin presented a case of butterflies from the Philippine, Molucca and Arrow Islands and Brazil.

Dr. Kellogg presented a specimen of the California snow plant, preserved in alcohol, and commented upon the laudanum odor the liquid had acquired.

Dr. Bolander stated that this curious plant is found in many shady places 6,000 or 8,000 feet above the sea, and is not confined to coniferous groves.

Prof. Blake said it was common high on the South Fork of the American, on the Placerville road to Virginia.

**CALIFORNIA PETROLEUM.**—Prof. Silliman read a paper on California petroleum, giving the results of recent analysis of heavy "surface oil" from Santa Barbara, a full digest of which is given in another column.

Mr. Stearns presented several original papers on Pacific conchology, prepared by Dr. Newcomb and himself, which went to the Publication Committee.

**MOUNT DIABLO AND WASHINGTON TERRITORY COAL.**—Prof. Blake presented an analysis of Mount Diablo coal, from the Pittsburg mine, showing the following components: Water, 3.28; bituminous substances, 47.05; fixed carbon, 44.90; ash, 4.71. The sample was apparently free from sulphur. It does not cake or make a compact mass of coke; and is therefore not an economical coal for gas production. It gives a long flame in burning, parts with its gas very rapidly and breaks up into small fragments, thus necessitating the use of grate bars with narrow openings.

Prof. Blake also read a note upon the brown coal formation of Washington Territory and Oregon. Openings recently made along the Cowlitz river have revealed several seams of brown coal from two to seven feet thick. The 7-foot seam is chiefly a very compact coal, having the appearance of canal or splint coal, burning freely, giving a bright flame and emitting a light smoke like that given from wood. It holds fire well and gives an intense heat under a draft or blast. Trials in quantity failed to show any caking qualities. A sample yielded about 50 per cent. of volatile matter, chiefly gas. The deposit appears to be formed in great part of trunks of exogenous trees. One trunk has been cut through that was over four feet in thickness. A part of this was compact coal, and another portion was in a half-silicified state. Lines of annual growth may be seen in some of the samples. This combustible partakes of the character of both coal and wood, and is in fact a highly condensed wood, carbonized, without the loss of its volatile portions. Fossil plants are found in abundance in the adjoining sandy beds. They are chiefly leaves of deciduous trees, but there are some very distinct impressions of palms. This is significant of a warmer climate. The same formation of brown coal appears to extend along the Columbia back of St. Helena, where it is in close proximity to beds of iron ore, and the coal may perhaps be used to great advantage in the production of that metal.

**ROYAL GEOGRAPHICAL SOCIETY.**—Dr. Gibbons read a letter from Sir Roderick Murchison, the distinguished President of the Royal Geographical Society of London, introducing J. B. Calbeck, who is on his way to Singapore in the interest of the Society, and who is also connected with the Peninsular and Oriental Steam Navigation Company. Mr. Calbeck made a few remarks expressive of his pleasure and surprise at meeting a society of so much interest and having such a broad scope of scientific work. He regretted that he must so soon leave this interesting and really great country, (he left on the Colorado,) and declared he should take pleasure in acquainting Sir Roderick Murchison with the cordial reception he had met, and should endeavor to promote reciprocity between the London Society and the California Academy.

**REMARKABLE SALT BEDS.**—Mr. Hanks read a paper describing a mountain of rock salt found near Muddy river, about 100 miles

from the Great Bend of the Colorado, in Arizona. It is about a mile wide, several miles long, and in places 400 feet high. The salt is entirely pure chloride of sodium. Contiguous to it are mines of silver, and it will be valuable for the chlorination of silver ores. Prof. Blake was reminded that the old Spanish maps have on them, in a locality near the one designated by Mr. Hanks, the name "Mountain of Salt," showing that the early Padres must have known of its existence. Prof. Silliman said that a hill of almost pure rock salt, more than a mile in area, on the western border of Louisiana, near Texas, was discovered during the rebellion and afforded the rebels supplies when it was supposed their sources were nearly all cut off. Prof. Blake stated that he had recently analyzed salt brine brought from near St. Helens, Oregon, which is remarkably free from magnesia. The salt is superior for dairy purposes.

## Contributed for Our Cabinet.

Under this heading we shall continue to mention and describe, according to merit, such specimens of ores, minerals, fossils, curiosities, etc., as may be presented, or forwarded to us by mail or express, prepaid. Each article will be numbered and placed in our cabinet, and recorded with the name of the donor, and the claim or location from whence it came.

Mr. ROBERT TREMBLE has placed upon our table several very fine specimens of silver ore, from a vein discovered by himself and partners, about one mile and a half north of the famous Poorman's vein, in Owyhee county, Idaho. The characteristics of this vein are so similar to that of the Poorman, and its position so directly in range, that there is the strongest presumption for the belief that it is an extension of that vein.

142—Is a very rich specimen of black sulphuret, and would probably assay near or quite sixty per cent. of silver.

143—Is chiefly red oxide of iron, carrying free gold, and yielding a good per cent. of silver.

144—Contains about fifty per cent. of silica, with gold and silver, oxide of iron, and colored with green carbonate of copper.

145—Similar to the above, with less silica and no copper.

146—Silica, evidently changed by heat; said to be a fair sample of the chief part of the quartz composing the mass of the vein. It is interspersed with sulphurets, carrying, probably, both gold and silver.

Attention was first led to the search of this vein by finding specimens of black sulphuret of silver, as was the case with the Comstock vein; although in that case the significance was not understood. The prospectors followed up their indications a considerable distance before they finally came upon the lode itself, on the 7th of September, 1865. Soon after they commenced work upon the vein proper, their operations were interfered with by a contesting party, and the development thereof has hitherto met with the usual delays encountered by nearly all promising discoveries, in the neighborhood of lazy prospectors and needy lawyers. Mr. Trimble and partners were winners in the suit which was commenced; but as an appeal was taken, there is still a prospect for more lawyers' fees ahead. It is the intention, however, of the present party to commence the active development of the mine early the ensuing spring.

**THE MANUFACTURE OF SHIRTS** is beginning to assume considerable importance in our midst. In addition to the California Shirt Manufactory, which commenced operations in 1865, at least two other large establishments, within the past few months, have been set on foot in the same line. The pioneer establishment passed into the hands of M. Esherg & Co., in January, 1867, and is now in successful operation at 511 Sacramento street, with from forty to sixty employees almost constantly engaged, and turning out not less than four hundred dozen shirts per month, including all the different varieties. Being made chiefly to order by measurement, they are represented as having a better fit and less liable to rip, in short, as being not only cheaper, but in every respect better than the imported, being put up from the best linen, flannel, or other material, to be found in the market.

**THE NEW MERCANTILE LIBRARY BUILDING.**—The corner stone of this edifice was laid at noon on Saturday, March 30th, under the auspices, and in accordance with the ceremonies of the Masonic Order, at the request of the Board of Directors of the Association. Accommodations were provided for invited guests, and a large number of spectators. Gov. Low, Mayor Coon, State, Municipal and Federal Officers, the Pioneers, two Chapters of the Royal Arch Masons, Officers of the Grand Lodge, and others, were present. The invited guests were escorted from the Occidental Hotel to the site of the building by a committee of the Association. The following was the order of exercises: Music; Prayer by the Grand Chaplain, Rev. Dr. Cox; Chant by 200 pupils of the Lincoln School; the presentation of a silver trowel to the Grand Master, by W. H. L. Barnes, President of the Association; the laying of the stone, with appropriate ceremonies; address by President Barnes; singing by the Lincoln School pupils, and Benediction by the Grand Chaplain. A box containing various articles, among which were specimens of the National coins and notes, copies of the city journals, etc., was placed in a cavity underneath the stone, and a list of its contents read by the Grand Sec'y. The occasion was a most interesting one, and the ceremonies most imposing.

The building will be an ornament to the city, and a credit to the Association. Its cost when completed, will, it is said, be nearly one hundred and fifty thousand dollars.

## Perry Davis' Vegetable Pain Killer.

As an internal remedy, has no equal. In cases of Cholera, Summer Complaint, Dyspepsia, Dysentery, Asthma, it cures in one night, by taking it internally, and bathing with it freely. It is the best liniment in America. Its action is like magic, when externally applied to bad sores, burns, scalds and sprains. For the sick headache and toothache, don't fail to try it. In short, it is a Pain Killer.

**PERRY DAVIS' PAIN KILLER.**—This medicine has become an article of commerce, a thing no medicine ever became before. Pain Killer is as much an item in every bale of goods sent to country merchants as tea, coffee, or sugar. This speaks volumes in its favor.—*Glen Falls Messenger.*

Sold by all Medicine Dealers everywhere. 14v14-1m

## Allen's Lung Balsam.

The following letter, from Dr. A. L. Seville, who has had many years experience in the medicine business, and with Lung Remedies, will give the afflicted still more assurance that the sure remedy is found at last; and the consumptive should lose no time in commencing the use of Allen's Lung Balsam:

*Gentle:*—I make the following statement from a perfect conviction and knowledge of the benefits of Allen's Lung Balsam, in curing the most deep-seated Pulmonary Consumption. I have witnessed its effects on the young and the old, and can truly say that it is by far the best expectorant remedy with which I am acquainted. For Coughs, and all the early stages of Lung Complaints, I believe it to be a certain cure, and if every family would keep it by them, ready to administer upon the first appearance of disease about the lungs, there would be very few cases of fatal consumption! It causes the phlegm and matter to raise, without irritating those delicate organs (the lungs) and without producing constipation of the bowels. It also gives strength to the system, stops the night-sweats, and cures all the morbid secretions to a healthy state.

Yours, respectfully, A. L. SEVILLE.  
Consumptives, do not despair, because all the remedies that you have tried have failed, but try this Great Remedy. Be sure you call for Allen's Lung Balsam. Price One Dollar per bottle.  
SOLD BY ALL MEDICINE DEALERS EVERYWHERE. 14v14-1m

## For Mines and Mills.

HUNTER'S  
Eureka Amalgamator!

**FOR WORKING THE SANDS AS THEY PASS FROM** the battery. The coarse particles of sand are reduced to pass through a No. 6 screen, then the sand passes through No. 5 in the battery; the fine flour gold is amalgamated on the plates in the machine. The construction of the machine is entirely new. The mangle is four feet eight inches square on the bottom, and covered with iron dies 12 inches thick by four inches wide, extending across the bottom with alternate strips of wood on end of the same width. The rollers are made of wood four inches square, and shod with iron and covered with copper plates, with spaces of four inches wide between rubbers. The box is also lined with copper plates. The machine is set in operation by connecting an oscillating motion; and the rubbers are suspended on iron hangers, and adjusted by set screws.

One-fourth of a horse-power is sufficient to run one machine of ten tons capacity. They do not require any attention to run them, for there is no packing of the sand when the machine stops.

The above machine has been thoroughly tested in the Eureka Mill, Grass Valley. The following order from W.M. WATT, Esq., of the Eureka Mill, will show his appreciation of the above machine:

"After a trial of two weeks of your Eureka Amalgamator, we have cleaned up and find it has saved seventy-five cents per ton over and above what we got from the copper plates of the other batteries. We run through it all the pulp that passed over the blankets from five stamps. This result is in our book that pays \$10 per ton. I am highly pleased with it, and I think it is the best machine after blankets or plates I have ever seen. It reduces the coarse particles of sand, and makes the pulp more uniform in size; it requires very little power to drive it; but the best recommendation I can give is that I want four more. Will you please go to the Vulcan Foundry and order them."

On the first of April I had an order for two more, for the Pittsburg Company at Nevada City.

The price for a Machine with rubbers made, and dies and wood set in the bottom, and all the iron complete, is \$275.

The weight is about one ton with cast iron box; but to save freight, the box can be made of boiler iron, saving 500 pounds weight.

Orders sent to the Vulcan Foundry, the Union Foundry, or the Fulton Foundry, first sent, will be promptly attended to.

ANDREW HUNTER, Patentee.

P. S.—Patent allowed.

HUNTER'S  
IMPROVED CONCENTRATOR.

**THE INVENTOR OF THE ABOVE RECENTLY IMPROVED** Machine, is now prepared to take contracts for concentrating gold or silver ores on shares, receiving a certain per cent. of the sulphurets as may be agreed upon, and will guarantee twenty per cent. more sulphurets than from any rocker or concentrator built on the Pacific coast, saving at least ninety percent. of the sulphurets contained in the ore. The sulphurets, if desired for shipping, will contain less than one per cent. of sand.

One of these Machines can be seen in operation at the Union Foundry, in this city, up stairs. 14v14

## A. S. Hallidie &amp; Co.,

MANUFACTURERS OF

## FLAT &amp; ROUND WIRE ROPE.

For Mining, Shipping, Ferry,

AND GENERAL PURPOSES.

Office—412 Clay street, ..... Works—North Beach

**NOTICE.**—THE FIRST COST OF WIRE ROPE IS MUCH less than that of any other kind of rope of equal strength, and it is four times as durable. Wire Rope does not stretch or shrink by atmospheric changes; it has but one-third the bulk of Hempen Rope; is spliced and repaired in the same manner.

The attention of Mining Companies is particularly called to our Flat and Round Hoisting Ropes, which have been in use for a number of years by the leading mines on this Coast, and to many of whom we refer those interested as to the great advantages over any other kind of rope; effecting an immense saving in expenditure for ropes, fuel, wear and tear of machinery, stoppage of works, etc., besides increasing safety of life.

Mining Companies, in erecting Hoisting Works, should be sure and have their drums and pulleys of sufficient size, whether for wire or hemp rope.

We manufacture of all sizes, and in any length—

**Round Wire Rope.**—Iron or Steel, for Hoisting.

**Flat Wire Rope.**—For Derrick Fall Ropes—

**Soft Steel Wire Rope.**—For Derrick Fall Ropes—very strong and durable—only third the weight of hemp of equal strength, (saving in freight for remote localities). Suitable sheaves and blocks furnished when required.

**Galvanized or Ungalvanized Round Wire Rope.**—For Ships, Dredging, Derrick Cables, Ferry Ropes, and all standing purposes.

**Steel Ferry Ropes.**—For wide streams. Ferry Blocks supplied.

**Iron and Copper Wire Cord.**— $\frac{1}{2}$  to  $\frac{3}{4}$ -inch diameter, for hauling window sashes; Signal Cord; Sash Pulleys on hand.

Comparative Weight, Size and Strength of Iron Wire Rope, Steel Wire Rope, Hemp Rope, and Chain.

satisfaction in every particular. 25v12-3m

**PETROLEUM PAINT.**—L. H. Tucker, of the *Country Gentleman*, in his notes on Long Island farming, thus alludes to a barn painted with petroleum:

On the farm of R. W. Titus, I examined a barn painted six years ago with petroleum (the heavy sort), mixed with Ohio mineral or earth-paint. It appeared not to have suffered in the slightest degree by weather and time, the coat being complete and unchanged. The barn is ninety feet long and thirty-two wide, with sixteen feet posts, the whole surface painted being about 4,000 square feet. The entire cost of the petroleum, the paint and of labor, was not over \$24. It would probably be one-third more at the present time. It is obviously a very cheap and perfect mode of coating wooden buildings, adapted even to handsome dwellings.

**DE PHOSPHORIZATION OF IRON.**—Mr. Warren De la Ruo (Edg.) has patented an invention which consists in the introduction of lead, metallic or oxide, into the converting vessel so as to be thoroughly diffused in the fluid metal, combining with the phosphorus in the iron, and the compound driven off by oxidation. Molten lead is introduced as soon as the blast has been turned into the converting vessel. Compounds are driven in with the blast, in the shape of powder.

A LARGE-oscillating rock is said to have been found in the wilderness of Western Arkansas. It is situated in the channel of a torrent, and moves to and fro, apparently from the action of the water. The motion produces a loud noise, which can be heard several miles—so the story runs.

### THE PACIFIC IRON WORKS,

First & Fremont Sts., between Mission & Howard, San Francisco.

The proprietors of the above Works invite the attention of all parties interested to their greatly improved and unequalled facilities for manufacturing Steam Engines and Boilers, both Marine and Stationary, of any required size and pattern. Quartz Mills, Amalgamating, Pumping and Hoisting Machinery of the most approved construction. Flour, Saw, and Sugar Mills, Water Wheels, &c., &c. Our pattern list is most complete and extensive, embracing the late improvements in all classes of machinery adapted to use on this coast. We would call special attention to the fact that we have secured the exclusive right of manufacture for the Pacific Coast of the celebrated Green Engine, conceded to be the most economical and perfect working Engine now in use. We are also exclusive manufacturers of the celebrated

Bryan Battery, Varney's Amalgamators and Separators, Ryerson's Superheated Steam Amalgamators and Rotary Crushers, Stone Breakers, &c. Orders respectfully Solicited.

There is a Restaurant attached for ladies and families, where persons can board for one-half they are required to pay at hotels. 17v13-6m SANBORN & CO.

#### Attention! Attention! Attention!

Look to Your Health in Time!

**HEALY'S CURATIVE OIL, FOR THE SURE AND speedy extermination of Pain, having no equal in the world, is now being universally sought after by all classes throughout the Pacific Coast. The Miner, the Mechanic, the Artisan, the Laborer, the Farmer, and the Merchant, pronounce it the Greatest Remedy of the age.**

Are you afflicted with Rheumatism? Use Healy's Curative Oil!  
Have you the Headache? Use Healy's Curative Oil!  
Have you a Sore Throat? Use Healy's Curative Oil!  
Have you the Toothache? Use Healy's Curative Oil!  
Are you subject to Cramps? Use Healy's Curative Oil!

And for the cure of Cuts, Burns, Sprains, and the bites of poisonous insects, it has no equal in the world. A sure and permanent cure guaranteed in every case. Full directions on every bottle. Kuno genuine analysis "H. J. L." is stamped on the cork, and the fac simile of FRANK HEALY'S signature on the outside wrapper of the bottle. Wholesale Agents—Crane & Brigham, and R. H. McDonald & Co., San Francisco; and at retail by all respectable Drug Gists and Chemists. Price, \$1. 2v14-10p

#### STANDARD SOAP COMPANY'S WASHING POWDER,

THIS POWDER IS SUPERIOR TO ALL OTHER PREPARATIONS for washing and cleaning. It is made of pure material, and contains nothing that will injure the finest fabric. Equally as good for use in hard as soft water. One pound will make three gallons of beautiful soft soap. Put up in wrappers of 1-lb each, and in wooden boxes of 10-lb bulk. Ask your grocer for a package, and test its virtue. Manufactured at 204 Sacramento street San Francisco. 15v12-2q

#### Blanks, Blank Mining Books,

Constitution and By-Laws

—FOR—

#### Mining and Prospecting Companies

Elegantly printed, with care and dispatch, at the office of the Mining and Scientific Press.  
Orders from the Interior faithfully attended to.

Favorable to Inventors.—Persons holding new inventions of machinery and important improvements, can have the same illustrated and explained in the Mining and Scientific Press, free of charge, if in our judgment the discovery is one of real merit, and of sufficient interest to our readers to warrant publication.

OF MILWAUKIE.

OVER FIFTEEN THOUSAND MEMBERS!  
And \$2,000,000 Assets!

ALL PROFITS  
Divided Among the Insured.

Dividend Jan. 1st, 1897, \$113,176.26.  
Sacramento References.—HENRY MILLER, of D. O. Mills  
& Co.; G. F. Hartwell, Asst. Supt. C. P. R. R.

## Golden City Chemical Works.

LABORATORY,  
Corner of Seventh and Townsend Streets.  
OFFICE,  
Corner of Montgomery and Bush Streets.  
CAPITAL STOCK, - - - \$500,000

### Trustees:

H. P. WAKELEE, THOS. H. SELBY,  
NICHOLAS LUNING, THOS. BELL,  
CHAS. E. McLANE.

H. P. WAKELEE.....MANAGER.

THIS COMPANY ARE NOW PREPARED TO FURNISH  
Sulphuric, Nitric and Muriatic Acids of superior quality,  
in quantities to suit.

Orders will be received at the office only for chemicals of  
every description, which will be manufactured as may be  
required. The Company beg to say that they have the advan-  
tages of all improved machinery and apparatus for the  
manufacture and manipulation of these products, and our  
Laboratory is fitted up with the most recent improvements  
which experience and science suggest, and is surpassed by  
none in completeness and perfection for the purposes it is  
designed. 9v14 3m

## Overland Route.

## THE PENINSULAR AND ORIENTAL

STEAM NAVIGATION COMPANY'S

### STEAMSHIPS

Leave Hongkong Twice a Month,  
(On the 1st and 15th in the Northeast Monsoon,  
and about the 11th and 29th in the  
Southwest Monsoon.)

—FOR—

SOUTHAMPTON AND MARSEILLES,  
VIA. EGYPT,

Calling at Singapore, Penang,  
Point de Galle, Aden, Suez, Alex-  
andria, Malta and Gibraltar.

From Point de Galle their steamers run to Madras,  
Calcutta, and Bombay, twice a month, and once a month  
to King George's Sound, Melbourne and Sydney.

From Hongkong their steamers run constantly to  
Swatow, Amoy, Foochow, Shanghai, and Yokohama.  
Hongkong, 1897. 13v14tf

## STOCK CERTIFICATES, STOCK TRANSFER JOURNALS, STOCK LEDGERS,

ASSESSMENT RECEIPTS,  
And all other Blanks, Blank Books, etc., required by Min-  
ing and other Corporations, kept on hand or printed to  
order on short notice, at moderate prices, at the office of  
the Mining and Scientific Press.

**Economy in Advertising.**—The MINING AND SCIENTIFIC PRESS is the best and most economical mining adver-  
tising medium in this city. Our terms are less than on a  
half the rates now charged by daily newspapers, and the  
mining community are beginning to appreciate our reason-  
able rates of advertising. The Press contains, proportionally,  
a larger amount of mining advertising than any other paper  
on the Pacific coast. Its character renders it the proper  
journal for the concentration of mining patronage.

## Metallurgy.

## Pacific Chemical Works.

FALKENAU & HANKS,  
Desire to call the attention of Druggists, Manufacturers,  
Metallurgists, Millmen, Assayers, Chemists and  
Students, to their

ANALYTICAL LABORATORY,  
And Establishment for the manufacture of Pure Re-agents,  
Pharmaceutical Preparations,  
And all CHEMICALS used in the Arts. They are prepared  
to make Chemical investigations.

Analyses and Assays,  
Of every description, and to give advice upon all matters  
pertaining to Technical Chemistry.

Office, 629 Washington street; Laboratory, Corner of

## EUROPEAN METALLURGICAL WORKS,

Practical Mining School,  
Bryant Street, Between Third and Fourth,  
SAN FRANCISCO.

THE Proprietors are at all times prepared to work or test  
Ores sent to this establishment—either in large or small  
quantities—by such process as may be found best adapted to  
their chemical character, after a careful analysis has been  
made. Test lots of Ore adapted to the smelting process at-  
tended to. Sulphuretted, pyrites, and the so-called "rebel-  
lous ores," are having especial attention paid to their suc-  
cessful treatment. Assaying in the humid and dry way.  
Also, refining by cupellation, done at moderate rates.

### PRACTICAL MINING SCHOOL.

The proprietors—encouraged by numerous applications  
from gentlemen desirous of pursuing the study of practical  
metallurgy—have concluded to admit pupils on reasonable  
terms. Having in their Mill all the necessary appli-  
ances for crushing, roasting, amalgamating, smelting, re-  
fining and assaying, as also a well extended Laboratory for  
the analysis of Ores and Minerals, a good opportunity is  
here offered to acquire a sound practical knowledge of the  
business.

S. F. KIMBALL, J. R. MURPHY,  
10v10

## MOSHEIMER'S Metallurgic Works

And Practical School for Assaying  
and Metallurgy.

THE UNDERSIGNED HAS REOPENED METALLUR-  
gic Works, and is prepared to reduce any kind of Ores,  
by Smelting, Amalgamating, or other processes, that the  
nature of the ore may require.

Practical instructions given in Assaying, all branches of  
Metallurgy and Technology.

Furnishes Plans and Estimates for the erection of Quartz  
Mills, Smelting and other Reduction Works.

Having carefully studied the science of Concentrating  
Ores, I can offer better concentrating machinery than any  
in use in California, and especially such as will save the  
fine or floating gold and sulphurets.

CONSULTATION OFFICE:  
328 Montgomery street, San Francisco.  
J. MOSHEIMER,  
26v13-3m Engineer and Metallurgist.

## J. A. BAUER, Chemical Laboratory,

AND DRUG STORE,  
644 Washington Street. [Established 1849.]  
SAN FRANCISCO.

Careful Analyses made of

Ores, Minerals, Waters, Oils, Liquors,  
Wines, Products of Art, etc.

Pharmaceutical Preparations Made to Order.

Opinions given on Chemical Questions and Geology.  
Particular attention paid to Analyses of all kinds, in  
cases where legal questions are involved.

Pure Nitric Acid, Nitrate of Silver, Gold Chloride, Platin  
Chloride, Sodium Amalgam. Sulphate of Copper, etc., for  
sale. 12v14-6m

### Important to Secretaries.

Secretaries will please write proper names and figures  
distinctly, and hand in their advertisements as early in the  
week as practicable. Our latest forms go to press Friday  
evening. Any infraction of the requirements of the  
laws regarding advertisements will be cheerfully given  
when solicited. Inspect all your notices carefully upon  
their first appearance. In case of postponement, give the  
earliest notice possible at the office. When copy is received  
sufficiently early, a proof-sheet will be furnished if desired.  
A revised copy rendered, for advertising at the mine, when  
required. Newly printed copies of advertisements, for  
serving individual notices to stockholders, printed at \$1 per  
hundred. Copies of the new advertising law, as officially  
published, furnished gratuitously. Blank forms, for  
filling out Assessment Notices and Delinquent Sales, sup-  
plied free to advertisers in the MINING AND SCIENTIFIC PRESS  
on application at the office.

Lead and Iron Pipes, Marble Slabs, etc.  
13v12-2q

TO VICTIMS OF RHEUMATISM IN  
ALL ITS FORMS.

BE IT KNOWN TO ALL WHO ARE AFFLICTED WITH  
this terrible and excruciating disease, that the means  
of a safe, speedy and permanent cure are within the reach  
of every sufferer, by using

RICHARDS' REMEDY!  
For Inflammatory, Chronic, Hereditary and Mercurial  
Rheumatism, Rheumatic Gout, Lumbago, Sciatica, and all  
the modifications of the disease, whether confined to one  
portion of system or erratic in their character. Composed  
wholly of VEGETABLE EXTRACTS, it exterminates the  
cause without injuring the constitution. None but the  
TORTURED SUPERBES who have been relieved from  
their agony by the operation of this remedy, can realize the  
ecstasy which the mere cessation of long-continued tor-  
ment imparts. Sleep returns, strength returns, health and  
hope return to the pain-worn and debilitated patient, and  
once cured, nothing but the grossest imprudence can lead  
to a relapse. The confidence with which these statements  
are made to the public, is the result of many years' ob-  
servation and experience. The reputation of mere palli-  
atives soon dies out, but that of a STERLING MEDICINE,  
which produces, year after year, in all cases, the same bene-  
ficial effects, NEVER DIES. This has been the history of  
Richards' Remedy. Try it!

RICHARDS' REMEDY is for sale by  
H. BOWMAN, Druggist, Sacramento,  
11v15 And by Druggists generally.

GAS.—The Marysville Appeal says, that  
all the oil boring works in the Coast Range  
foot-hills, Colusa county, have ceased, but  
one. The well of the company in operation  
has been sunk to the depth of about 500  
feet. It yields a steady supply of a good  
illuminating gas, and pipes are being laid  
for the purpose of lighting a mill with it.

### To Capitalists.

GOLD QUARTZ MINE, SITUATED IN CALAVERAS  
County, with steam mill fitted up with Amalgamating  
Pans, etc., FOR SALE. The mine has three main veins, and  
more than \$20,000 have been spent in opening them and com-  
pleting the mill. Good wagon roads all the way. Apply to  
BELLOC FRERES, Bankers,  
23v13-6m 633 Clay street, San Francisco.

### Quartz Mill Construction and Superintendence.

THE UNDERSIGNED IS AT PRESENT OPEN FOR AN  
engagement as a working Superintendent in the con-  
struction or operation of a Quartz Mill. Has had five years  
steady and successful experience in working ores in Washoe,  
and is practiced in saving sulphurets and the treatment of  
rebellious ores. Is prepared to furnish references for all  
the necessary qualifications of an intelligent, faithful and  
reliable quartz operator. Address F. B. SHAW,  
San Francisco, care Mining and Scientific Press. 10v14-3m

### Professional Cards.

SHERMAN DAY,  
Mining Engineer,  
No. 114 Montgomery Block, San Francisco,  
Will examine, survey and report upon mines, and consult  
and advise concerning investments in mining property, or  
the machinery management and expenditures of mines.  
22q

FREDERICK MANSELL,

And in accordance with law, and an order of the Board of Trustees, made on the nineteenth day of February, 1867, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the office of the Company, No. 302 Montgomery street, San Francisco, Cal., on the twenty-third day of April, 1867, at the hour of 12 o'clock M. of said day, to pay said delinquent assessments thereon, together with costs of advertising and expenses of sale.

M. O. ELMORE, Secretary.

Office, 302 Montgomery street, San Francisco. ap2

**Chippewa Mining Company—District of Ures,** Sonora, Mexico.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-eighth day of March, 1867, an assessment of five dollars per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at his office, 318 California street, up stairs, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the second day of May, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twentieth day of May, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

JOHN F. LOHSE, Secretary.

Office, 318 California street, San Francisco, Cal. m9

**Dardanelles Copper Mining Company, Low** Divide District, Del Norte County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held at Crescent City, on the sixteenth day of March, 1867, an order was made annulling the assessments levied February 29th, 1864, April 7th, 1865, August 22d, 1865, and June 21st, 1866, and levying an assessment of forty-five (45) cents per share upon the capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary at Crescent City, California.

All stockholders having paid on the aforesaid annulled assessments, will have credit on this assessment. Any stock upon which said assessment shall remain unpaid on the fourth day of May, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Saturday, the first day of June, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

A. O. WOOD, Secretary.

Office, at Woodbury &amp; Marhofer, Crescent City, Cal. ap5

**George Washington Gold and Silver Mining Company.**—Location of Works: Silver Mountain District, Alpine County, Cal.

Assessment No. 18. Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the fifth day of April, 1867, an assessment of five dollars (\$5) per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the Company, only.

Any stock upon which said assessment shall remain unpaid on the eleventh day of May, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the third day of June, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

A. O. WOOD, Secretary.

Office, 333 Montgomery street, San Francisco. ap9

**Lyon Mill and Mining Company, Kelsey District,** El Dorado County, California.—Office, 5 Government House, corner of Sansome and Washington streets, San Francisco, Cal.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the third day of April, 1867, an assessment of two (\$2) dollars per share was levied upon each and every share of the capital stock of the Lyon Mill and Mining Company, payable immediately, in United States gold coin, to the Secretary.

Any stock upon which said assessment shall remain unpaid on the fourth day of May, 1867, will be advertised on that day as delinquent, and unless payment shall be made before, will be sold on Saturday, the eighteenth day of May, 1867, at 12 o'clock M. of that day, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

J. M. BUFFINGTON, Secretary.

## Mining Notices—Continued.

**Coscan Silver Mining Company, Coscan District,** State of Sonora, Mexico.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twelfth day of March, 1867, an assessment of one dollar (\$1) per share was levied upon the assessable capital stock of said Company, payable immediately in United States gold and silver coin, to CHAS. RAUM, Secretary, at the office of this Company, 510 Battery street, opposite the Custom House, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on the eighteenth day of April, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the third day of May, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

CHAS. RAUM, Secretary.

Office, No. 510 Battery street, opposite the Custom House, San Francisco, California. mh16

**Camargo Gold and Silver Mining Company,** Lander County, Nevada.

Notice.—There are delinquent upon the following described stock, on account of assessment levied on the 14th day of February, 1867, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
Campbell, J. A.	7	5	\$100.00
Drinkhouse, J. A.	8	5	60 00
Dinkelspiel, L.	51	5	60 00
Harker, W. B. C.	23	20	100 00
Harker, W. B. C.	24	10	20 00
Harker, J. W.	134	3	50 00
Jacobs, N. B.	85	4	20 00
Greene, N. O.	83	4	20 00
Frost, A. J.	133	3	50 00

And in accordance with law, and an order of the Board of Trustees, made on the fourteenth day of February, 1867, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the office of the Company, by Jones & Bendixen, Auctioneers, on the 21st day of May, 1867, at the hour of two o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

N. C. FASSETT, Secretary.

Office, 402 Front street, San Francisco. mar30

**Diana Gold and Silver Mining Company, Lander** County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-second day of March, 1867, an assessment of five dollars (\$5) per share was levied upon the capital stock of said Company, payable immediately, in United States Currency, to the Secretary, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on the third day of May, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the fourth day of June, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

N. C. FASSETT, Secretary.

Office, 402 Front street, San Francisco. mar30

**Emilia Mining Company, State of Guerrero,** Mexico.

Notice.—There are delinquent upon the following described stock, on account of assessment levied on the 20th day of February, 1867, the several amounts set opposite the names of the respective shareholders as follows:

And in accordance with law, and an order of the Board of Trustees, made on the twelfth day of February, 1867, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the salesroom of Maurice Dore & Co., No. 327 Montgomery street, San Francisco, Cal., on Monday, the eighth day of April, 1867, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

MAX. BURCKHEART, Secretary.

Office, Room No. 1, Crim House, No. 523 Kearny street, San Francisco, Cal. mar23

**Olney & Co., Auctioneers and Real Estate Agents,** attend promptly to all business entrusted to their care in San Francisco and Oakland. Mining and other corporations will find Col. Olney well posted and thorough in transacting sales of delinquent stock. Office, on Broadway, Oakland, and No. 318 Montgomery street, San Francisco. nol0**Gold Quarry Company. Location of Works:** Placer County, State of California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-first day of March, 1867, an assessment of twenty dollars (\$20) per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary, (Room No. 4) No. 706 Montgomery street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the twenty-second day of April, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the thirtieth day of May, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

T. W. COLBURN, Secretary.

Office, Room No. 4, 706 Montgomery street, San Francisco, Cal. mar23

**Great Central Mining Company.—Location of** Works: Yuma County, Arizona Territory.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the first (1st) day of March, 1867, an assessment of one (\$1) dollar per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the Company, No. 302 Montgomery street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the eighth day of April, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the thirtieth day of April, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

O. D. SQUIRE, Secretary.

Office, No. 302 Montgomery street. mar9

**Keystone Mining Company. Location of Works:** Copperopolis, Calaveras County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twentieth day of February, 1867, an assessment of ten dollars (\$10) per share was levied upon the capital stock of said Company, payable immediately in United States gold coin, to the Secretary, at his office, No. 410 California street, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on the twenty-first day of April, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twentieth day of May, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

O. P. SUTTON, Secretary.

Office, 410 California street, San Francisco. mar9

**Mount Tenabe Silver Mining Company.—Lo-**cation of Works: Cortez District, Lander County, State of Nevada.

Notice.—There are delinquent, upon the following described stock, on account of assessment levied on the fifteenth day of February, 1867, the several amounts set opposite the names of the respective shareholders as follows:

Names.	No. Certificate.	No. Shares.	Amount.
Oordon, John	18	75	\$112 50
Gillespie, Henry	19	37	55 50
Galagher, James	50	100	150 00
Hest, J. R.	27	270	414 00
Lehmann, Christian	24	5	7 50
Macpherson, A. W.	26	299	448 50
Vandervoort, J. C.	23	50	75 00

And in accordance with law, and an order of the Board of Trustees, made on the fifteenth day of February, 1867, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the salesrooms of Maurice Dore & Co., No. 327 Montgomery street, San Francisco, on Thursday, the eleventh day of April, 1867, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

R. N. VAN BRUNT, Secretary.

Office, 331 Montgomery street, San Francisco. mar23

**Nuestra Señora de Guadalupe Silver Mining** Company. Location of Works: Tayoltita, San Dimas District, Durango, Mexico.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the fifteenth day of March, 1867, an assessment of No. 25 of one dollar (\$1) per share was levied upon the assessable capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, E. J. PFEIFFER, at the office, No. 210 Fourth street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the seventh day of April, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Wednesday, the fifteenth day of May, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

## Machinery.

# STEWART'S CELEBRATED HINGED Grinder and Amalgamator.

## Is the Cheapest and Quickest Pan

Now used. It is flat-bottomed, loses far less power in throwing the pulp, and circulates the same under the miller to better advantage than any other Pan in use, while the stream owing to the thinness of the cone, has a more direct effect in heating the pulp. E is the miller plate; F the Grinding Shoe, attached by an adjustable hinge joint in the middle of the same—bottom wearing down even with the dries.

Mr. J. H. STEWART, the inventor, has had ten years' experience in mechanical operations, and may be addressed at San Francisco, or called on at the Miners' Foundry, First street, where his Pan is manufactured, and is to be seen at any time in operation.

## VARNEY'S PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the miller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Sellers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and sellers for themselves, at the **PACIFIC FOUNDRY,** 1st San Francisco.

## Steam Pumps,

FOR DRAINING MINES OR ELEVATING WATER TO ANY HEIGHT.

## PICKERING'S GOVERNORS

For Steam Engines.

## Giffard's Injectors,

For Feeding Boilers.

## STODDART'S IRON WORKS,

Beale Street, San Francisco.

## BRUCKNER'S Mechanical Roasting Furnace

AWARDED A

## PREMIUM SILVER MEDAL

—BY THE—

## The Mechanics' Institute.

Patented December, 1863.

THESE FURNACES ARE NOW MANUFACTURED AFTER an improved mode of construction, which GREATLY SIMPLIFIES THEIR OPERATION, and afford a much larger oxidizing surface to the action of heat and atmosphere.

The weight of a Furnace nine feet long by four feet in diameter does not exceed one ton.

## THE IMPROVED FURNACE

May be seen in operation, for desulphurizing or roasting and chloridizing, at Central Mill, Virginia City, Nevada.

Parties wishing to erect such Furnaces, are requested to leave their orders with

T. KALLENBERG,

416 Market street, San Francisco.

## REMINGTON'S ARMOY.

Agency, 310 Washington st., San Francisco.

## PRICES REDUCED!

These arms have been preferred by the United States Government, and stand unequalled by any in the world. Revolvers, Army, Navy, Belt and Pocket, Double and Single Action; Repeaters, and vest-pocket Pistols, with copper ammunition; Police Revolvers, a new model, navy size ball, 4 1/2 to 6 inch barrel; Rifle Guns—an entirely new and most perfect one. All the new models for sale very low.

ALBERT E. CRANE.

Our Circulation.—THE MINING AND SCIENTIFIC PRESS has a large and permanent subscription list, and enjoys a more universal circulation among stockholders and persons directly interested in mining than any other paper on this coast.

## Brodie's Patented Improvements

## FOR THE TREATMENT OF Gold and Silver Ores.

BRODIE'S PATENTED IMPROVED QUARTZ CRUSHER. The attention of all interested in Mining is respectfully called to this improved Machine for breaking or Spalling Quartz, or other Rock, possessing, as it does, simplicity of action and lightness of construction, so far as is compatible with strength and durability. In consequence of these advantages, the advertiser is enabled to offer these machines to the public at the following low terms: No. 1—Or 8-inch Crusher, capable of reducing from three to four tons of quartz per hour, no piece being larger than a walnut—price, \$600. No. 2—Or 12-inch Crusher, capable of reducing through five to six tons per hour—price, \$850. No. 3—Or 18-inch Crusher, will in a similar manner crush from seven to eight tons per hour—price, \$1,200.

EXPLANATION OF THE ABOVE ENGRAVING. The frame is made of cast iron, bound with heavy wrought iron bands, making it very strong, and at the same time light and portable. The crusher is bolted to a wood frame of sufficient height to clear the fly-wheel, and allow the crushed rock to fall into the hopper below. The hopper is made of stationary jaws. Letter A represents the eccentric shaft by which the power is applied direct to the movable jaw. B represents the movable jaw, and C the fixed jaw. D represents the link or radius bar. E represents the bolts for regulating the opening, P, which can be regulated at pleasure, so as to graduate to the size to which it is intended the quartz shall be crushed. G represents the feed opening, by which the size of the machine is designated.

The arrow on the fly-wheel shows the direction to drive the eccentric, which, in combination with the link, D, gives the movable jaw, B, a forward and downward motion at the same time, and which makes the hardest rock yield and submit to fragments of any desired size.

The above Crushers have been recently erected and are now successfully employed at Bear Valley, Mariposa county, Rawhide Ranch, Tuolumne county, Excelsior Mine, Lake District, Nevada county, and can be seen in operation at the Fulton Foundry, First street, San Francisco.

The following testimonial respecting the effectiveness of this Crusher, has been received from the Superintendent of the "Rawhide Ranch" Mine, in Tuolumne County:

Rawhide Ranch, Tuolumne Co., Sept. 28, 1866. JAMES BRODIE, Esq., San Francisco—My Dear Sir: It gives me pleasure to inform you that I have for the past three months had one of your largest sized Rock Crushers in use, at the Rawhide Ranch Mining Company's Mill, which is entirely met my expectations; and I have no hesitation in recommending it to all who are in need of a machine for rapidly, cheaply and properly preparing quartz for the stamps. Yours truly, Supt. Rawhide Ranch Quartz Mill.

BRODIE'S PATENT IMPROVED GERMAN AMALGAMATING BARREL.—This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, in 1864. Further particulars will be afforded on application to the subscribers.

Those infringing the patent rights to the above improved Barrel, are hereby informed that on and after the 1st Nov. 1866, the royalty charged for using the same will be raised to the sum of \$100 per Barrel. A diagram, with explanations of this machine, will be found in the "Mining and Scientific Press," of September 29th, 1866.

BRODIE'S PATENT WIND-BLAST SEPARATOR FOR DRY CRUSHING.—This Dry Crusher has been found the most economical and effective mode of crushing ores in Mexico, California and Nevada. Diagrams and explanations afforded on application to the subscribers.

A drawing and full description of this machine will be found in the Mining and Scientific Press of Sept. 22d, 1866. J. BRODIE & F. A. BLAKE, Express Building, 402 Montgomery street, San Francisco.

## Hooker's Patent Pump Valve.

A. A. A. are the guides which work in the corners of the Valve Chamber, and secure the valve from turning. B is the body of the Valve. F shows the edge of the India rubber facing, which is secured to the bottom of the Valve by a washer and screw, and is not liable to wear or tear. The advantages claimed for this Valve are: 1. Cheapness of construction. 2. Greater durability. 3. As it rises square from the seat on all sides, the area for the passage of water is largely increased at a small elevation of the Valve, thus insuring the discharge of more water than with the common pump valve. 4. With this Valve a pump may be run at a high rate of speed, and insure a larger supply of water. One drawing for the use or manufacture of this Valve, are for sale by

V. CUSHING, 120 Front street, San Francisco. These Valves are used in the EXCELSIOR PUMP, which is giving such general satisfaction to the public.

## Notice to Miners,

## Well-Borers and Water Companies.

M. PRAO IS NOW PREPARED TO MANUFACTURE Hydraulic and Artesian Well Pipes in the best workmanlike manner, and at the lowest market rates. Having made large additions to my stock of machinery for that trade, to business men prepared to fill orders with dispatch, and guarantee entire satisfaction. I also manufacture Mississippi Stoves, of the latest improved patterns, for vessels of all classes. Also, Ship Plumbing done.

813-17 Stove Store, No. 125 Clay street, below Davis.

Being a PRACTICAL MACHINIST, and giving my personal attention to the execution of orders, I can guarantee the BEST class of work at the LOWEST PRICE in the city. Office, No. 120 Front street, San Francisco.

3v14-1r

## The Terrace Desulphurizing Furnace.

In connection with the "Shelf Furnace" described in our issue of last week, it will doubtless be interesting to many of our readers to learn of another furnace, which works on the same principle, but differs somewhat in its construction. It is known as the "Terrace Furnace," and though but quite a recent invention, is coming into general use in Germany, Hungary and Swansea. One of these furnaces has recently been put up at the works of S. E. Lyon & Co., in Colorado, where it is said to give good satisfaction. We copy the following description of it from the Colorado Mining Register:

In construction it resembles a smoke stack of bricks or stone some twenty feet high. The inside dimensions are two and a half by four and a half feet. This inside opening extends from top to bottom. On the top is a hopper, into which the pulverized ores are thrown; and from which they are fed into the furnace by a revolving apparatus, which operates with great regularity, perfectly controlling the amount of ore admitted. Across the furnace from the hopper nearly to the bottom, bars of burned fire-clay are placed so that as the ore falls into the furnace it drops from one to another, probably striking twenty or more of them before it reaches the bottom, thus greatly impeding its descent. At the bottom is a fire-grate, where a fire is kept up seven or eight hours, when the furnace becomes thoroughly heated and the fire is no longer needed, the combustion of the ores furnishing abundant heat. Thus when the ores fall into the furnace at the top they are at once ignited, as in the Keith furnace, and before they reach the bottom are thoroughly oxidized and desulphurized. After once becoming hot, the fire-grate is closed, and only place left at the bottom for shoveling out the ores as they fall. The fumes, of course, rise upward to the hopper on the top, where at one side is an opening into a flue, which draws these fumes down again nearly to the level of the base of the furnace, where they pass off laterally to a condensing chamber, where the fine particles of ore are collected, the gases passing on to a perpendicular flue, and escaping there. Additional condensers for collecting the sulphuric acid evolved may be easily attached if desired. When once heated up, the combustion of the ores will, without the aid of fuel, keep up the requisite amount of heat from one year's end to another, as long as the furnace lasts. The leading and important features of the furnace are that the work is well done, and with very little expense. The first cost of one of these furnaces will not exceed one thousand dollars. One person can attend six of them without difficulty. When the ores contain a large amount of sulphur, as most of them do, no fuel is required after the furnace has been heated. A furnace of this kind is capable of roasting four tons per day.

Our readers will at once observe the similarity of construction between this and the furnace which we described last week; the essential difference is such, as is claimed that the "Terrace Furnace" may be made self-feeding. The idea that it can be made to furnish its own fuel, and perfect the work of desulphurization, after being once heated up, must be incorrect, as will be readily apparent to every one at all conversant with the great heat required for throwing off the last equivalent of sulphur. Such a furnace might answer for copper ores where the completeness of the desulphurization is not so necessary as in auriferous sulphurets. The adjunct of the reverberatory, we think, will be found absolutely necessary for the proper treatment of such sulphurets.

REVISION OF THE MINT LAWS.—A Washington telegram to the *Alta*, of date April 2d, is as follows: The Secretary of the Treasury has sent a letter to the Senate in reference to the revision of the Mint laws. He proposes that the Mint relinquish the refining of gold and silver, and leave the business wholly to private enterprise, and also repeal the coinage charge. He transmits a communication from Louis A. Garnett, formerly the officer of the Mint at San Francisco, now connected with an extensive silver refinery. He says the abrogation of all taxes and restrictions on milling enterprises, and the repeal of all charges at the Mint, would tend to develop the country and increase its products of the precious metals.

A. T. STEWART, the princely merchant of New York, promises to be a noble rival even to Peabody, in the extent, if not in the number of his benefactions. It is said that he intends to devote six millions for the benefit of the poor in New York city, in the way of furnishing them with comfortable and healthy dwellings. He is also erecting a splendid Art Gallery of the most imperishable materials, for the benefit of his adopted city. Where is John Jacob Astor? Does he not intend to enter the lists of noble rivalry with Peabody and Stewart? Or will he hold fast to his hoarded wealth, and continue to grind the poor that he may be, or his son may be called, the richest man in the world?—richest in sordid dust; but poor indeed in that which most ennobles a man, and longest keeps his memory green and fresh in the hearts of coming generations.

**BREAKING UP FROZEN GROUND.**—Before the work on the Eastern end of the Pacific Railroad was suspended, last winter, recourse was had to gunpowder. The contractor says that he found the most expeditious way to break up frozen ground was to blast it up with powder, a few pounds of which, thus employed, would do the work of a score of laborers. Powder, for such purposes, is much used in the mines in this State, when it is necessary to loosen up the ground before sluicing it off. It has also been used to break up ground, as well as rocks, for grading.

The copper mines of Tennessee have yielded since the war more than one thousand million pounds of ingot copper.

## Gaston's Screw Grinder and Amalgamator

—18—  
 The Best Yet Invented.

For rapidity and thoroughness of work, the machine above illustrated is unequalled by any. It wastes no appreciable quantity of quicksilver, and is of itself a perfect settler. Fig. 1 represents the pan with part of its side removed, and fig. 2 the screw miller, and its shoes. The letters c show the threads of the screw; H, its shoes, and D a low cylinder within which the screw rotates; E, represents open spaces through the base of the cylinder, and F, inclined partitions filling (at those points) the spaces between the cylinder and the shell of the pan. These inclined partitions are to intercept the current of pulp around the pan, as it issues from under the miller, and turn it toward the center again, over the screw. The dies are not shown in the figure—there are eight. Mercury is not ground, nor floured in this pan. The pulp is ground to a slum, with great rapidity; the miller is raised a little and the quicksilver is poured in *en masse*, forming a layer upon the bottom of the pan. The revolution of the screw then forces the pulp down into contact with the quicksilver, into which it is *effectually rubbed* by the shoes, while the screw, being constantly fed by the pulp from above it, presses all under the miller outward—still in contact with the quicksilver, through the spaces, E, and thence over toward the center of the pan, when it is again seized by the screw and forced down into the quicksilver, rubbed into and forced off in contact with it, which process is continued as long as desired. The pulp can thus be forced into contact with the mercury at the rate of 1,000 pounds in three minutes, or twenty times per hour, and none can escape contact with the mercury, that contact being under the immense pressure of the perpetual screw, in addition to that of gravity, which (gravity) is the only available force in the other pans for bringing the pulp into contact with the quicksilver. "A word to the wise is sufficient." The Screw Amalgamator is the cheapest and most efficient pan manufactured. Millmen! call and see one running at the Pacific Foundry. For particulars, address the inventor, H. A. GASTON, at Cosmopolitan Hotel, San Francisco; or R. L. THOMAS, Esq., Virginia City, Nevada. 1v14qr

## Portable Steam Engines!

"Hoadley's" and "Hittinger's" Make.

HOADLEY'S.

FOUR SIZES,

8, 10, 12, and 15-Horse Power,

HOADLEY'S.

3 to 40-Horse Power.

HITTINGER'S.

THREE SIZES,

5, 7, and 10-Horse Power

HITTINGER'S.

TWO SIZES,

5 and 7-Horse Power,

COMBINING THE MAXIMUM OF EFFICIENCY, DURABILITY, and Economy, with the Minimum of weight and price.  
 These Engines are favorably known, a large number being in use on this coast for hoisting, pumping, threshing, milling and mining purposes.  
 Steam can be got up on these Engines in fifteen minutes after reaching the place of operation, and the time, expense of setting boilers, machinery, and "construction account" saved, (which is often the difference between the successful and unsuccessful prosecution of mining enterprises,) in fact, the portable principle is the miner's friend, and enables him to draw engines on their own wheels, to his cabin door, and plant on the outermost confines of civilization the saw and grist mill, and it has done and will do more to help subdue the continent than any other of the modern motors which are crowding society and normalizing the world.  
 All sizes on hand from 3 to 30 horse power, with and without carriages.  
 Also, Portable Saw and Grist Mills.  
 For sale by  
**TREADWELL & CO.,**  
 Corner of Front Market and streets.

## New Patents and Inventions.

Under this heading we shall mention, from week to week as occasion may demand, New and Important Inventions; also, the List of Patent Claims recently issued from the U. S. Patent Office to inventors on the Pacific Coast, and other Patent Issues which we deem of local interest to readers on this side of the Continent. Most Patents on this coast are secured through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We are prepared to obtain from Washington, with despatch, copies of any Patent issued.

## PATENTS RECENTLY ISSUED.

62,371.—THERMO-ALARM GAUGE.—Richard Savage, San José, Cal.:

I claim the above described thermo-alarm gauge in combination with a steam generator.

62,378.—CASE FOR TRANSPORTING EGGS.—J. L. and G. W. Stevens, San Francisco, Cal.

We claim a case for packing and transporting eggs, constructed with compartments substantially as and for the purpose herein described.

62,431.—AUTOMATIC FAN.—J. A. W. Lundborg, San Francisco, Cal.

I claim the frame, B, bearing the shaft, R, to which is attached the fan, C, having metallic frame, c2, when constructed and arranged to operate with the clock-work, as herein set forth.

## RECENT INVENTIONS.

**SUBMARINE HYDRAULIC MACHINE.**—Mr. John Pike, of Astoria, is the inventor of a contrivance for dredging the bottom of a stream. The motive power is steam. The invention contemplates a graduated hose which will work in any depth of water without the intervention of a diver. It is to be used exactly as mining hydraulic apparatus—to disintegrate and wash out the deposit on which it is played. The inventor claims that he can take the apparatus, on any of the bars of a river, and by playing the hose on the gravel or sand aggregation, can sluice it out and thus deepen any channel which can be dredged by the ordinary method, and at far less expense. The hose may be carried on shipboard, and, attached to the engines, may be used for getting the vessel afloat when stuck upon a shoal, by washing the ground from under it.—*Oregonian.*

**A NEW MOTIVE POWER.**—James G. Duncan, of Rattlesnake Bar, Placer county, has recently invented a new motive power, which he describes as follows: "It is an Electric Engine. The model weighs forty-two pounds, and works admirably. It runs fast or slow, backwards or forwards, with great or limited power at will, and is under perfect control; has an eight-inch stroke, and the whole is quite simple, not complicated in any way. It gives 210 pounds direct power, or working power. Estimating from the size and power of the model, I can make a fifty-horse power machine, which could be placed in a box 6x6 and eight feet long, and the cost of running it would not exceed one dollar every five days, for acids to supply the battery." The inventor is anxious to secure assistance to enable him to demonstrate the value of his invention on a large scale.

**A NEW GRADING MACHINE,** working on the principle of a scooper, has recently been devised at the East, which it is said is likely to prove valuable in this State, especially for turnpikes and railroads in localities composed mainly of sand, small gravel, loam or clay. We understand that Mr. Brannan has ordered one of the machines for use on his Calistoga road. It is said that one machine will do as much work as six men, with carts and horses. One of the machines may be seen at Rosekrans' hardware store in this city.

**Beware of Counterfeits!**—NOTICE TO THE PUBLIC. "Healy's Rheumatic Liniment" having been imitated (poorly, however,) by an inferior and pernicious article, and sold in this market for the genuine, the proprietor of Healy's Rheumatic Liniment has made an alteration in the general Trade Mark, and also substituted for Rheumatic Liniment "Curative Oil." This Great Remedy will be known hereafter as "HEALY'S CURATIVE OIL." 15v14f

**Stebbins' Grinder, Amalgamator and Concentrator,** combined and all within the same pan, can now be seen in operation at the Franklin Foundry, Fremont street, between Mission and Howard. Sulphurets perfectly concentrated within thirty minutes on the rim of the pan near the surface of the water—the process of grinding and amalgamating going on at the same time. All the inventor asks is an examination of his new Concentrator, believing it to be the best and quickest ever yet invented. 14v14 f

BLAKE'S PATENT  
QUARTZ CRUSHER.

## CAUTION!

The owners of the Patent for this valuable machine, in order to facilitate the protection of their rights against numerous infringers, procured, some time since, a reissue of the Patent, bearing date January 9th, 1886.

This Patent secures the exclusive right to employ in Stone-Breaking Machines Upright Convergent Jaws, actuated by a Revolving Shaft.

All persons who are violating the Patent by the unauthorized making, selling or using machines in which quartz or other material is crushed between upright convergent jaws, actuated by a revolving shaft, are hereby warned that they are appropriating the property of others, and that they will be held responsible in law and in damages.

Several infringing machines are made and offered for sale in this city, upon which Patents have been obtained. Manufacturers, purchasers and users, are notified that such Patents do not authorize the use of the original invention, and that such machines cannot be used without incurring liability for damages.

## Foundry for Sale.

A One-half Interest in the

UNION IRON WORKS,  
SACRAMENTO,

Owned by William R. Williams, is offered for sale on the  
most favorable terms.

## A Good Bargain

May be had, as the proprietor is going home to Europe. It  
is seldom that so good an opportunity is offered for a sure  
and permanent investment. The business of the establish-  
ment is exceedingly flourishing, as can be shown. The  
Shop is of brick, new and well built. The lot is 35 feet front  
by 163 feet in depth, in a good location for this business, on  
Front street, between N and O streets.

Inquire at the office of the Foundry, or address

WILLIAM R. WILLIAMS,  
Sacramento, Cal.

26v13tr9-19p

## Pacific Mail Steamship Co's

STEAMSHIPS FOR

NEW YORK, JAPAN AND CHINA.

LEAVE FOLSOM STREET WHARF, AT 11  
o'clock A. M. of the following dates, for  
PANAMA, connecting via Panama Railroad, with one of  
the Company's splendid steamers from ASPINWALL for  
NEW YORK.

On the 10th, 18th and 30th of each month that has  
30 days.

On the 10th, 19th and 30th of each month that has  
31 days.

When the 10th, 18th and 30th fall on Sunday, they will  
leave on Saturday preceding; when the 18th falls on Sun-  
day, they will leave on Monday following.

Steamer leaving San Francisco on the 10th touches at  
Manzanillo. All touch at Acapulco.

Departures of 18th or 19th connect with French Trans-  
Atlantic Co's steamer for St. Nazaire, and English steamer  
for South America.

Departure of 18th connects with English steamer for  
Southampton and South America, and P. B. R. Co's  
steamer for Central America.

The following Steamships will be dispatched on dates as  
given below:

April 10th—MONTANA.....Capt. Jos. Sutton,  
Connecting with HENRY CHAUNCEY, Capt. Gray.

April 18th—SACRAMENTO.....Capt. J. M. Cavarly,  
Connecting with OCEAN QUEEN, Capt. Harris.

April 30th—CONSTITUTION.....Capt. W. F. Laidley,  
Connecting with the RISING STAR, Capt. Manry.

Cabin passengers berthed through. Baggage checked  
through—100 pounds allowed each adult.  
An experienced Surgeon on board. Medicine and attend-  
ance free.

These steamers will positively sail at 11 o'clock. Passen-  
gers are requested to have their baggage on board before 10  
o'clock.

Through Tickets for Liverpool by the Cunard, Inman and  
National Steamship Lines, can be obtained at the office of the  
P. M. S. & Co., San Francisco.

For Merchandise and Freight for New York and way  
ports, apply to Messrs. WELLS, FARGO & CO.

For passage and all other information, apply at the Pacific  
Mail Steamship Co's office, corner of Sacramento and  
Leidesdorf streets.

OLIVER ELDRIDGE, Agent.

**MINERAL LANDS IN DISTRICT NO. 8.**—R. M. Wilson of Tuolumne county, was on the 9th inst. appointed by U. S. Surveyor General Upson, Deputy Surveyor for this mineral district, comprising the counties of Tuolumne, Mariposa, Fresno, Merced and Stanislaus. His office will be at Sonora, Tuolumne county. Those who are in possession of mining or agricultural lands in those counties can now secure patents for them. These deputy-surveyors will always be in a position to give information in regard to mining or farming property, in their respective districts. They will be men of intelligence, and will be under heavy bonds to properly discharge the duties of their office.

**THE RAILROAD CONSTRUCTOR ENDORSED.** Immediately after the last trial of the railroad constructor on Friday last, the following endorsement of the value of the invention was written by an engineer present, who had no interest in the machine, and handed to Mr. Robertson, the inventor: "The undersigned, Civil Engineers, have this day witnessed a trial of Mr. Robertson's railroad track-laying machine, and take pleasure in pronouncing it, as far as this trial went, a perfect success. As a labor-saving machine, in distributing materials for a railroad track, its value is very great. We see no reason why it should not do all that is claimed for it." Signed—Richard P. Hammond, T. R. Brooks, William Epler, William Moberly, B. P. Brunner, and others.

**NOT OUR FAULT.**—The Reese River Reveille of April 4th, in criticizing the report of the Nevada State Mineralogist, speaks of a statement in that report—made "on the authority of the MINING AND SCIENTIFIC PRESS"—as incorrect. The paragraph is wrongly quoted in the report, as will be apparent on reference to the article. It will be found in the Press for Oct. 13th, 1866.

**HONOR TO WHOM HONOR IS DUE.**—Capt. J. L. Worden, who commanded the never-to-be-forgotten Monitor, at the time of her victory over the Merrimac in Hampton Roads five years ago, arrived in this harbor on the 6th inst., in command of the war steamer Pensacola.

**MERCANTILE LIBRARY ASSOCIATION.**—We have received a copy of the Fourteenth Annual Report of the President, Treasurer and Librarian of this Institution. It contains tabular statistics from the organization to the present time.

## The Antioch Copper Mines--Cause of their Failure.

Ross Browne, in his report on the mineral resources of the Pacific coast, gives the following very interesting account of the copper smelting works, put up in 1862 at Antioch, on the San Joaquin river, near Mount Diablo. The works were erected under the direction of Mr. Thomas Price, an experienced Welch metallurgist, who has been for several years engaged in the purchase of copper ores in this city, on account of English smelters, being at the same time in the employ of Kellogg, Hewston & Co., as their analytical chemist, but not superintendent, as stated in the report. Mr. Price is also Professor of Chemistry at the City College, and in the Toland Medical College.

The works consisted of two reverberatory furnaces—one for roasting and one for smelting—not "a reverberatory furnace and roasting kiln." They were built on the plan of those in use at Swansea, but on a somewhat smaller scale, and with a slight change in the form of the grate, to better adapt them to the character of Mount Diablo coal. These furnaces were built as an experiment, chiefly to test the adaptability of the Mount Diablo coal for smelting purposes, and to ascertain the quality and quantity of heat which it will generate. The report says:

It would occupy too much space to enter into any extended details of the nature of this coal; but it may be necessary, to make the subject plain to those who have never paid any attention to the study of such matters, to state that in a reverberatory furnace the fire in its passage up the chimney strikes the roof, and is forced down upon the ore by means of a "bridge," built between it and the burning fuel. In all flames, no matter how generated, there is one portion more intensely hot than the others. This is called the "reducing flame," because of its action in reducing ores, under certain conditions, into metals. All coals do not produce a flame of the same nature or length, and the operation of the reverberatory furnace depends, in a great measure, upon its being so constructed that the "bridge" is placed so that the reducing portion of the flame is caused to strike the ore at the proper point.

After this explanation it will not require any technical or scientific knowledge of the principles of combustion to understand that a furnace to use fuel, which burns with a short flame and little smoke, requires great modifications in its construction when it is to be used to burn fuel which produces a long flame and much smoke. The experiments at Antioch settled this point clearly, if not satisfactorily to those interested, and proves, for general information, that furnaces built on the plan of those used at Swansea, in which the short-flamed Welsh coal is used, are not adapted for the use of the long-flamed coals of the Pacific coast. But the question whether this long-flamed coal could not be used for smelting purposes, in a suitably constructed furnace, remains still unsettled. Mr. Price states that Mount Diablo coal could be economically used for that purpose in a properly constructed furnace, but thinks no attempt should be made to proceed any further than in the conversion of the ores into regulus. The price of all descriptions of coal being so much higher on this coast than a better article can be obtained in other countries, the refining of the metal can be more profitably done in those countries.

It is much to be regretted that the company, which expended nearly \$50,000 [The cost of the furnaces was only \$7,000.—Eds. Press], in making these experiments at Antioch, did not carry them out to a full conclusion, by permitting Mr. Price to make such changes in the form of the furnace as his skill and experience may have suggested. But in California, where money commands from 18 to 24 per cent. interest, such experiments are not considered profitable.

The first bar of metal from the Antioch smelting works was received at San Francisco on the 14th of September, 1863, and created almost as much interest as the first bar of bullion from Washoe. During the time these works were in operation they produced about 200 tons of matt, or regulus, of an average of about fifty per cent. [Mr. Price informs us that the average did not exceed forty-two per cent.—Eds. Press], the balance being iron, sulphur, silica, etc. This was obtained from about 2,000 tons of ores from various parts of the State, but chiefly from Copperopolis, of an average of about ten per cent., and none of which, as delivered in lots, was below 7½ per cent.

The coal used in the operations cost about seven dollars per ton delivered on the grounds of the company. One ton of this coal, it was estimated, would reduce two tons of ore, after the furnace had become thoroughly heated; but in consequence of the difficulty in obtaining good materials for lining it, the furnace was not kept steadily heated. The best imported fire-bricks, in consequence of the action of the sulphur [1] in the ore, would not endure more than about fifteen days [2]. Work had consequently to be stopped within that period, and everything cooled off, in order to re-line the furnace. This entailed a great loss in the cost of fuel and labor, as well as of metal, and as the works were calculated to operate on about eight tons of ore in twenty-four hours, these stoppages absorbed all the profits.

A Mr. Henry Davis, another practical Welsh copper smelter, who had been in charge of an extensive smelting establishment in Chilo previous to his arrival on this coast, has made a number of experiments at the works at Antioch since they were closed by the original owners. This gentleman also expresses the opinion that the Mount Diablo coal, used in a properly constructed furnace, could be profitably employed in the reduction to regulus of such ores as will not pay the ship bulk [3].

1. Sulphur has no action upon the walls of the furnace; the injury results from the silica, alumina and oxide of iron, combining with the material of which the bricks are composed, thus changing their original nature, and rendering them reducible under great heat.

2. The furnace will work much longer than the period named, with the exception of a small portion of the lining in immediate contact with the matted mass. There is but little general wear to the great portion of even the lining of the furnace. The small portion which was affected at the furnaces at Antioch is also equally affected in furnace operations in Swansea, where the very best materials are employed. It is not necessary to stop the furnaces to make the repairs so required, as they are such as can be readily repaired in a few minutes, between the charges.

3. Reverberatory furnaces can, undoubtedly, be made to work well with Mount Diablo coal, with a slight change in the fire-place from that used at Antioch. Another very important advantage might also

be obtained by mixing the Mount Diablo coal with about one-fourth its weight of Sydney coal. In this manner the whole would form one compact mass, and the saving, in being able to burn all the Diablo coal, would more than compensate for the extra cost.

Mount Diablo coal, when thrown upon a hot fire breaks up into very small pieces, and is suddenly converted into a mass of fine coal, which will not allow the air to pass through it, and the moment you touch your grate-bars, the coal falls through unconsumed. The bars have, consequently, to be kept so close that little draft can be obtained; while in a reverberatory furnace a well opened grate is necessary for draft. This can only be obtained with Mount Diablo coal, by mixing it with some other very highly coking coal.

There is little doubt but that copper smelting will be carried on here profitably, and at an early day. The demand for copper in California is very great, and there is no reason why this State may not eventually supply the great market for this metal, both in India and China. India alone takes some 15,000 tons of metallic copper from Great Britain annually, a large portion of which probably finds its way into China. This trade properly belongs to San Francisco, and with proper effort may eventually be secured. The great importance of this trade may be realized, when we consider the fact that to produce 15,000 tons of metallic copper, not less than 75,000 tons of twenty per cent. ore or 150,000 tons of ten per cent. ore is required. We intend to take up this subject in earnest soon, and lay before our readers a true statement of what can and should be done in this State with regard to copper smelting.

India and China probably afford the best market for copper in the world, and one which must continue to increase in proportion as those countries open up their intercourse with other parts of the world. The copper shipped thither from England goes forward in small bars or ingots, of from six ounces to one or two pounds in weight, and is extensively used there as a medium of exchange, the same as gold and silver bullion.

**ECONOMICAL ILLUMINATING GAS.**—The Pacific Woolen Mills, at the corner of Nineteenth and Folsom streets, are now lighted by the new Ensley gas, which we have several times alluded to as a very economical illuminating agent, obtained by a recently patented process, from wood and animal matter. The gas appears to be fully equal to that furnished by the San Francisco Gas Company in the ordinary way, from coal. Large numbers of our citizens have been out to see it during several evenings of the past week. We shall, next week, endeavor to give a full description of this gas, its mode of manufacture, and its economy and applicability on a large scale to this and other large cities, as well as to isolated localities and small communities.

"The Reese River country and its Mines," from "A. J. H.," will receive due attention.

## Communications.

IN THIS DEPARTMENT we invite the FREE discussion of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[Written for the Mining and Scientific Press.]

## The New Mineral (?) "Partzite."

EDITORS PRESS:—In your issue of the 9th inst., you have favored my notice and description of the new mineral "Partzite" with a rejoinder, which calls in question the correctness, not only of my assumption as to the novelty of the said mineral, but also my statements regarding some of its characteristics. Permit me to say that your remarks in this respect are based upon grounds such as I should never have expected to be called upon to refute. In writing to a "scientific" journal on a scientific subject, I deemed it of course unnecessary first to enter into an explanation of terms for which science has long established a certain definite meaning. If people upon this coast are pleased to use the words, Mineral, Rock, and Ore, *ad libitum*, and without special distinction, it is certainly not asking too much that men of science keep aloof from such a confounding disregard for a terminology, without which it is impossible to make one's self understood and avoid confusion in matters of science. Now, as it is plain that the main point at issue between us lies simply in a misapplication of terms, on your part, it will be necessary first to state what science means by the terms above mentioned.

A *Mineral* is any substance in inorganic nature which has a homogeneous structure, certain uniform physical properties, and a fixed chemical composition. The term, therefore excludes all mere mechanical compounds, and only refers to substances which conform to some distinct chemical formula. Thus galena is a mineral, because it always consists of one equivalent of lead and one equivalent of sulphur, and has always the same physical properties. For the same reason are calcite, silver glance, copper and iron pyrites, quartz, etc., minerals.

"A *Rock* is any bed, layer or mass of the material of the earth's crust. The term, in common language, is restricted to the consolidated material. But in Geology it is often applied to all kinds, whether solid or unconsolidated earth, so as to include, beside granite, limestone, conglomerates, sandstone, clay-slates, and the like solid rocks, gravel-beds, clay-beds, alluvium, and any loose deposits, whenever arranged in regular layers or strata, as the result of natural causes. The constituents of rocks are minerals."—*Dana's Geology*, p. 49.

An *Ore* is any substance found in inorganic nature, which contains a metal, or several metals, that may be turned to practical use. Such metals may be either in their pure or "native" state, or in chemical combination with oxygen, sulphur, arsenic, carbonic acid, silica, etc. A piece of ore may also be a mineral, which is the case whenever the metalliferous substance which constitutes it is in a specific chemical combination, and free from all incidental admixture, commonly called "gangue;" but generally an ore is a complex of various minerals.

A mineral may also become an ore, through association of a metal. Thus, if the mineral "quartz" contains gold, it attains the character of an ore. The same it is if the calcite deposited in the fissure of a vein carries chloride of silver, and the peculiar conglomerate called "gold cement," and consisting of numerous minerals, is an ore, because it contains gold. There seems to prevail among the people on this coast, a strange aversion to the word "ore," which I can only ascribe to their general fondness for odd names and terms. When a miner meets in the bottom of a shaft with the object of his search, he will hardly ever say that he struck ore; no, he struck rock, or mineral, although it was rock composed of minerals that he had to go through all the way from the surface. If such linguistic violence is even winked at by the public press, whose office it would seem to be to

check it, we are certainly on the road to Babylonian confusion.

Now, in my article on Partzite, it was not my intention to give a description of the Blind Spring ores. What I intended and did, was to describe a certain mineral, one certain homogeneous body, which I found among those ores, and so long as it is not shown that this same mineral has heretofore been examined and described, and so long as no analysis of a mineral can be produced which corresponds to the formula established for the Partzite, the latter is unquestionably to be recognized as a *new mineral*. It matters not if the same mineral occurs in other mining localities, and if years ago silver has been reduced from it. An animal may for thousands of years have dwelt in some remote corner of the earth, and may ever so long have been known to the aborigines of that region; but the moment it becomes known to science it is a zoological novelty; and Partzite, becoming known to science, is, for a like reason, a mineralogical novelty.

But there is another dusky point, which requires a little illumination. You speak of an analysis made by some friend, whom you do not name. I wish you had prevailed upon that gentleman to personally enter the arena, as, in a controversy like this, it is far more agreeable to directly address one's opponent than to argue with him through the editor of a paper. This is especially felt when truth calls for directness of expression; and I am compelled to say, that what your friend seems to have considered an analysis, has not even the semblance of such a thing. The results of an analysis are generally given in per cents., the total of which must give a sum verging on one hundred, and the greater or less deviation of that sum from one hundred indicates the degree of exactness exercised by the analyzer. What you state as the result of two analyses, gives in one case the sum of 51.5, and in the other, 62.5. May I ask what has become of the missing 48.5 and 37.5 per cent. of the "analyzed" substance? It is true your friend adds: "With carbonic acid, silica and sulphur," and he might as well have added "several other things;" but if one makes an analysis, using the term in its true application, one is not permitted to say, "with this and that," but is required to give the percentage of "this and that," particularly when it is intended to disprove or question the correctness of an analysis by another person; and, besides all this, how can something be called an analysis, in which a mixture of two bodies, such as lead and antimony, amounting respectively to 41 and 46.5 per cent., is given per estimate. But here, again, is one of those peculiar Californian violations of the English language, lying at the bottom of the misunderstanding. I have often been requested to make an analysis for silver or gold. This is simply nonsense. The purpose of an analysis is to determine, with almost mathematical accuracy, each and every component part of a given substance; and as its results are generally more of a scientific than of a direct practical interest, and consequently their own aim and end, the work does not admit of taking time and expense into account. If, on the other hand, one or more component parts of a substance are to be determined for some practical purpose, requiring no absolute exactness, but claiming, as practical things generally do, a due regard for time and expense, an *assay* does the work. The special province of an assay is to determine the existence, chemical nature and quantity of useful metals, or other useful minerals, that may be contained in a piece of ore or rock, or in an artificial product. An analysis has no particular reference to the practically useful, but must be absolutely impartial, and pay the same respect to the inutile parts of a substance, as to the utile.

Your friend has made no analysis of a mineral, but simply assays of some ore; and the correctness of his assay I do not question. The Blind Spring ores contain all the substances he enumerates, and a good many more. Besides Partzite, which constitutes their principal metalliferous mineral, they also contain native silver, chloride of silver, silicate and carbonate of copper, galena, oxide, carbonate and sulphate of lead, spathic iron, peroxide of iron, quartz, clay, etc. From this list you will see whence came the "carbonic acid, silica and sulphur." I am, however, a little surprised that your friend found no iron, which so much abounds in the Blind Spring ores.

There remains yet a word to be said about the hardness of the Partzite. I found it to scratch calc-spar, while it was scratched by fluor-spar. Its hardness, consequently, lies between three and four, according to the scale accepted by all modern mineralogists. How your friend managed to determine a hardness of 4.5—4.7 and of 4.2, is certainly

an enigma to which mineralogy in its present state of development furnishes no key. It must, therefore, be presumed that his *modus operandi* is based upon some new invention or discovery which yet remains a secret, and by the publication of which he would confer a benefit upon science, and much oblige, Yours very respectfully,

ALBERT ARENTS,  
Mining Engineer and Metallurgist.  
Blind Spring Dist., Feb. 26, '87.

P. S.—Allow me to correct a slight error in my first article on Partzite. CH in line 32, should be CIH.

I am sending you for your cabinet, two samples of Blind Spring ore, which mainly consists of Partzite.

[Written for the Mining and Scientific Press.]

GRASS VALLEY, March 13, 1867.

EDITORS PRESS:—You state in one of your late issues "That a mass of iron weighing 1,000 pounds at the equator, would weigh 1,005 pounds at the pole." Last spring the *Californian* contained several articles to the same purport, in which the writer, a Professor, asserted, that a person purchasing a ton of coffee at the equator, would find he had gained considerable in weight upon bringing it north toward the pole; as the weight is caused by the attraction of gravitation, which increases as we near the pole, I am under the impression (perhaps erroneously) that both the above propositions are deduced from false premises. In the first place, neither iron nor coffee are weighed with a "spring balance," which is the only instrument with which the article weighed would change its weight, with a difference of gravitation. In the second place, I believe that an article weighed with a spring balance would weigh *more*, and not *less*, at the equator than at the poles. My reasons for believing so are the following: "Gravitation is what constitutes the weight of bodies, and depends upon the quantity of matter in the bodies attracting, and their distances from each other." \* \* \* From the above law it follows that large bodies attract much more strongly than small ones, provided their densities are equal, and their distances the same.—*Herschell*.

Now the equatorial diameter of the earth is twenty-six miles greater than the polar diameter; consequently, a mass of iron on the surface of the earth at the equator would most undoubtedly be affected by this superabundance of matter, and, as far as I can see, it could only be affected in one way, and that is, it would weigh more than where the diameter is less.

A. C. D.

The question of gravitation involved in the above communication, was quite fully discussed in the *American Artisan*, pages 198 and 230 of the present volume. The matter is not of sufficient practical importance to warrant any very elaborate discussion upon it in our already crowded columns; although we should not object to giving place to a rejoinder to "A. C. D." should it be brief and to the point.—[Eds. PRESS.]

## From Pahrnanagat.

PAHRNANAGAT, March 16th, 1867.

MESSRS. EDITORS:—You will be glad to hear that we at last have a prospect of mail facilities at an early day. At present our postal matter comes to us burdened with extravagant express charges; the result is that hardly any papers are taken here. The MINING AND SCIENTIFIC PRESS is a favorite here, and as soon as mail service is put on, you will have quite a list of subscribers from this place.

The Pioneer mill has made two runs—the first of thirty tons second-class ore, wet crushed, amalgamated twenty-six per cent. of the assay; sulphurets saved. The second of seven tons first-class ore, dry crushed and roasted, yielded nearly 200 pounds of silver bullion, very pure, and equal to ninety per cent. of the assay. The rock was from the Illinois, a monster ledge, though the quality of the rock is considered inferior to that of most others in this district.

The machinery of two 10-stamp mills is nearly all on the ground, and early spring will find times lively.

It must not be forgotten that the Pharanagat valley contains over ten thousand acres of excellent land, and our farmers are busy opening their farms, and preparing for operations in the spring.

ORION.

## The Brown's Valley Mill Experiments.

EDITORS PRESS:—In answer to the remarks of your correspondent, "T. M.," I will state that the experiments in our Pennsylvania mill, were made in the three Chile mills, with tailings of exactly the same value; the same quality of quartz was crushed in the four batteries, and these "tailings" were the result of blanket concentrations from three batteries. One Chile mill, you will recollect, was fed direct from one battery; the tailings passing over copper plates only.

I stated in my communication to the *Appal*, that during twenty-four hours each of the three Chile mills had been charged with a certain quantity of sand; but I omitted to state that the forty-eight ounces of amalgam obtained were the result of one week's run of the four Chile mills. If each of the mills had been worked after the manner of No. 4, the result of the four together should have been, per week, ninety-six ounces of amalgam, or at \$5 per ounce, \$480—from 1,440 shovelfuls only; for the result of 50 per cent. of these tailings was entirely lost by making the experiments in Chile mills, 1, 2 and 3.

The great difference in the result of Chile mills 2 and 4, I simply ascribe to the richness of the mechanical part of gold contained in the sulphurets, which assay \$550 per ton; for it can scarcely be supposed that it really requires four hours grinding in a Chile mill to reduce to slime such sand as may only contain free gold.

The Pennsylvania had, during this winter, very great trouble with water—they are now over it, and have again a full supply of rich rock for their sixteen stamps. They continue to make different kinds of experiments with tailings, sand and sulphurets. When finished, you shall hear from me. M.

Brown's Valley, April, 1867.

## Frictional Resistance of Water.

EDITORS PRESS:—In your issue of March 23d, page 179, a short article appears, stating that "the friction of fifty square feet of surface on a vessel's side, which has been smoothly painted, is found to be about eight pounds at four nautical miles per hour; when the speed is increased to eight miles, the friction is increased to twenty-five pounds; at sixteen miles, the friction would be seventy-five pounds."

This does not seem to accord with previous experiments made by eminent engineers, both in this country and in Europe—Beafoy and others—which go to establish that the friction is very nearly as the square of velocity. If, therefore, four miles per hour gives eight pounds, eight miles per hour ought to give thirty-two pounds, and sixteen miles per hour ought to give one hundred and twenty-eight pounds.

The following is an extract from Col. Beafoy's work:

Velocity in feet per second...	2	4	6	8	10	12
Friction in lbs. per 50 square feet.	0.637	2.647	5.777	10.06	15.45	21.94

The friction in this table is very nearly as the square of the velocity, which, as applied to miles or knots per hour, will give—

Speed in knots per hour.	4	8	16
Friction in lbs. per 50 square ft.	7	27	100

STEAMER.

San Francisco, April 2, 1864.

PNEUMATIC RAILWAY.—The New Jersey Legislature has before it a bill to incorporate a company for the purpose of constructing a pneumatic railway between New York and Washington. A model was exhibited recently at the State House in Trenton, which worked satisfactorily.

SIX-POUND MOLARS.—The *Amador Ledger* of April 6th says another of those mammoth teeth was found last week on the Dane ranch by the miners. Its length was ten inches. The place where it was found is 2,500 feet above the sea level. Several of these teeth were exhumed in the same neighborhood some years ago.

CONCENTRATORS IN NEW YORK.—Mr. J. Hendy informs us that a set of working drawings for his improved concentrator, have been forwarded to manufacturers in New York city.

## Mechanical.

## Enameling—Important Improvement.

Enamels are substances of the nature of glass, differing from it, however, by a greater degree of opacity, and in most cases of fusibility. The ancients carried the art of *ornamental enameling* to a very high degree of perfection; exceeding, in some of their productions, anything which can now be accomplished. The cause of the loss of these, and many other curious processes of the ancients, has arisen from the fact that it was the custom in those days for each artisan to make a mystery of the means in the accomplishment of his work, that succeeded best with him, and his secret was often carried with him to the grave. The modern device of "Letters Patent," by which every inventor is protected for a reasonable length of time in his invention or discovery, provided he will place the same on permanent record for the benefit of future generations, has effected a most important revolution in that particular. The Patent Office system is the great preserver, as well as protector, of inventions.

The chief efforts of modern civilization in the line of enameling, as in most other departments of discovery and invention, has been utility rather than ornament. To this end various devices have been resorted to, to render permanent and innocuous the enameling of iron and earthen ware for manufacturing and household purposes. It has long been thought that combinations of innocuous earths *might* be made which would accomplish this purpose; but hitherto no art has been able to make them available. Muspratt, in his Chemical Dictionary, the latest work of the kind published, suggests that it would be well to try a combination of sulphate of baryta as the base of an enamel, supposing that it might be so combined with certain fluxes as to be rendered solid and firm enough to resist such heat, acids, and other conditions as are involved in the ordinary employment of wares so prepared. He suggests that a series of experiments should be tried, with that end in view.

From recent reports from Hartz, we judge that the above idea of Muspratt has been fully realized, and by the use of the very material he suggested—the sulphate of baryta. This mineral has been successfully employed for enameling iron vessels, without the accompaniment of either tin or lead; and it is said that the baryta-enamel is far more durable and unchangeable than the poisonous material heretofore employed. The reason for this arises from the fact that the sulphate of baryta is a compound of one of the strongest acids, and is not decomposed by any other acid—at least under ordinary heat—and is entirely unaffected by vinegar or acidulated fruit, etc., even upon continuous boiling. This enamel, moreover, does not become dull or rough; but it is thought it will remain perfectly white and smooth, with ordinary usage, until destroyed from breakage or other rough use.

Enamelled cast iron kettles for the laboratory and kitchen, in the latter especially, for making preserves and doing up fruit, have of late years come into very extensive use. The objection, which has of late years been urged against their use, on the score of the poisonous nature of the enamel will probably be removed as soon as the general knowledge of the improved enamel, shall have sufficed to drive the objectionable article from the market.

Every housewife should take especial precaution when she buys an enamelled kettle, to test the enamel by means of some acid—the stronger the better. Dip a piece of cotton into the acid, then place it on the enamel for twenty-four hours, subjected, if convenient, at least a part of the time, to a moderate heat. If the spot is ever so slightly roughened, or otherwise defaced, reject the vessel as unfit for use.

**EARLY IRON VESSELS.**—The earliest form adopted for the construction of iron vessels, were wall-sided, flat-bottomed troughs of thick sheet iron, riveted together at the seams like steam boilers, precisely like a long, trough-like tank, fitted with a wooden cover for a deck. They were just such vessels as would have been devised for boiling a whale entire, had such an operation been desired. They were built upon the Clyde, where such splendid specimens of iron naval architecture have since been turned out. They answered well the object for which they were designed—the navigation of shoal rivers, and served the purpose of the introduction of a new era into the mechanics of ship building. The little iron steamers which are now being built in this city, by Mr. Cameron, of the Neptune Iron Works, for the Lake Chapala (Mexican) trade, are almost the exact *fac similes* of those early efforts at iron ship building. They, too, answer exactly the service for which they are intended; nothing could do better. They would doubtless be found great improvements over the flat-bottomed wooden steamers which are now employed in navigating the shallow rivers of California.

**IRON SUPPORTS—USEFUL RULES.**—In these days of iron fronts and iron supports, when iron forms such an important portion of our metropolitan structures, the following extract from a very able, useful and practical paper, lately read before the Liverpool Architectural Society, may be read with much profit and interest. We quote as follows:

It may be truly said that gravity is the ultimate source of all the strains that arise in buildings; but for convenience it is necessary to resolve the resultant into compression and tension. It was formerly usual to employ iron chiefly to resist the latter, but economy of space and length of bearing have brought both into its service. \* \* \* The first point to be ascertained by an architect with a casting of iron is to find out what it has to do.

The practical man wants simple tools. Science is always consistent with successful practice; therefore simple rules are sufficient. The following for iron pipes of ordinary sizes answers well, and it never has been published before. It is based upon the fact that a 10-inch pipe one inch thick will stand the pressure of 100 yards head of water. The coincidence of one inch of metal to every 10-inch diameter and 100 yards pressure should be remembered. For every inch in the diameter of pipe, increase or deduct one-tenth of an inch, and for every yard of pressure increase or deduct one hundredth of an inch.

In calculating the strength of columns great care is necessary. The safe plan is to find the diameter of a solid column necessary to bear the compression, and then distribute the same area of metal in tube form as a hollow column. \* \* \* A solid column ten feet long, and having an area of ten square inches (good metal) will bear ten tons pressure. This rule can be conveniently carried out, and it is safe and practical. It is really not so much what we know as what we can successfully use that is valuable in science and art.

**STEAM SUPERHEATING.**—All the benefits obtained from superheating steam by passing it through tubes in a furnace before it is admitted into the cylinders, is said to be also obtained by keeping steam in a jacket surrounding the cylinder, and maintaining it at a temperature somewhat above that which operates the piston. It has been found in practice that the very dry steam which is produced in the tubes running through a furnace cuts the cylinders and packing. Steam jacketed cylinders are being extensively employed in England.

**COKE** is generally supposed to be capable of producing a hotter fire than anthracite. The intensity of heat is in proportion to the amount of combustion in a given space. The fuel which burns the quickest and occupies the smallest space, should give the hottest fire.

**HARDENING BY FRICTION.**—Steel spindles for cotton spinning, are heated for hardening at the step end by friction, on a revolving wheel, without the aid of fire.

## Scientific Miscellany.

## Inland Salt Deposits—How Formed.

Various speculations have been indulged in, from time to time, with regard to the manner in which large deposits of rock salt have been formed. The most probable theory may be briefly stated as follows:

It is well known that the waves of the sea throw up large quantities of sand, which is often subsequently piled up by the winds into hillocks and ridges, sometimes to the height of 100 to 150 feet. The beach to the west of this city, and, in fact the chief part of the peninsula on which the city is built, most likely had its origin from such a source. It often happens that after a ridge is thus formed, counter-currents may scoop out a place back of them to the level, or even lower, than the sea. At unusual high tides, and during heavy storms, the water may be forced over the intervening banks, so as to fill up the depression beyond. There being no opportunity for the water to escape, it is soon evaporated by the heat of the sun, leaving a deposit of salt. By the frequent recurrence of such action of the sea, a heavy deposit of salt is formed, eventually, which, under favorable conditions, is often of great purity and thickness. Such was evidently the origin of the famous deposit near New Iberia, La., first brought to the general knowledge of the world during the late rebellion; at least such is the opinion of Prof. Richard Owen, of Indiana, who recently visited that locality, and made a careful examination of it. The Professor further states, that there are evidences of similar saline inundations in that vicinity, extending fully twenty miles inland from the Gulf; but in no other locality than the one alluded to, have the conditions been sufficiently favorable for any very valuable deposit.

The salt deposit on Carmen Island, in the Gulf of California, is precisely such another deposit, in process of aggregation, or would be on the increase were it not for the large drains which commerce is daily making upon its bulk. The "mountain of salt," as it is called, on the Colorado, is another instance of the same action on an ancient sea-beach, which has since been considerably elevated and exposed to the abrading action of the winds, which have swept the sand from its base until the salt, formerly occupying a basin, now stands up above the surrounding plain like a mountain.

**TIDES IN THE GREAT LAKES.**—The question of the existence of lunar tides in the great lakes has never been fully established until quite recently, when Col. J. D. Graham, U. S. A., presented to the American Association for the Advancement of Science, the result of a series of careful observations and measurements, made with the especial view of determining the question. It appears from his report that there is such a tide, but that its maximum height is only *four and a half inches*.

**NATURAL MINERAL WATERS** are in part derived from decomposing rocks, but in part from the water which impregnates the buried marine sediments, and is really fossil sea-water. This, more or less modified or diluted by admixture, forms most saline mineral waters. The amount of water imprisoned in the unaltered sedimentary rocks of the earth is very great, amounting for many limestones and sandstones to from five to thirty per cent. of their volume. So that, without speaking of that in the pores of the unknown rocks beneath the sea, it may be said that those of our present continents include in their pores a volume of water which is a large proportion of the bulk of our present ocean. We may even calculate that a time will come, when from the cooling of our globe, and the resulting porosity of the mass, the whole of the water, not already included in the sedimentary deposits, will be absorbed, to be followed by the atmosphere itself; so that our planet will one day be like the satellite, without either sea or air.

**PHYSIOLOGICAL EFFECTS OF SULPHIDE OF AMMONIUM.**—The physiological effects of gaseous sulphide of ammonium recently came near resulting in a fatal accident, at some experimental works in the manufacture of this gas by a new process, lately described by Peter Spence, of Manchester, England. It appears that a sudden escape of the gas accidentally took place near where a man was standing, when he became unconscious and perfectly rigid in a few moments. Violent rubbing of the chest and cold water on the head, soon re-developed vitality; but with violent convulsions which lasted an hour and a half. No ill effects, however, were perceivable the next day. The poison thus appears to be sudden and violent; but if not immediately fatal, seems to be only very transitory in its effect.

The new process for the manufacture of this gas consists in mixing a salt of ammonia, say a sulphate or chloride, with double its weight of soda waste or gas lime; blowing with the mixture a jet of steam, and condensing the escaping gas. The condensers must be closely watched, lest the gas first come over so strong as to condense in a solid form. It was by an escape of gas from such a condenser that the accident above alluded to occurred.

**HYDRAULIC CEMENTS.**—Lieut. Q. A. Gilmore, U. S. A., has recently been making some careful researches into the chemistry of hydraulic cements. His experiments show that the commonly received opinion that clay must be mixed with lime to give the property of setting under water by forming a double silicate of lime and alumina, is incorrect. The same result can be obtained by using manganese and probably other bases. The most remarkable fact proved by his experiments is, that the hydraulic property of a cement produced directly from the limestone, is materially effected by the process of calcination. If the stone be subjected to a red heat for too short a time, the hydraulic property will not be developed in the resulting lime. Also, if it be over burned, it will not give a setting lime. Further, there are successive states of calcination at which the resulting lime will possess the power of setting under water. First, if the stone be subject to a red heat for a short time, it will not give a hydraulic lime. If it be continued at red heat for another period, the lime will be hydraulic. If the heat be continued for still another period, its setting property is destroyed—and so on, for several stages. There is, however, one amount of burning for each stone which gives the best result, and which has to be determined by experiments upon the stone from various quarries and from different veins in the same quarry, and the determination of this amount of burning in each case would well repay the manufacturer of such cements, by enabling him to produce them of the best quality.

The quickness of setting is modified greatly by the temperature of the mixing water. While the adhesion of the mortar to stone depends upon its softness, and the strength upon its stiffness. Therefore a thin mortar for making joints is best, while a stiff or thick mortar is best for forming a "bed."

**PHILOSOPHY OF A SNEEZE.**—The nose receives three sets of nerves—of smell, of feeling, and of motion. The former communicates to the brain the odorous properties of substances; the second communicates the impressions of touch; the third moves muscles of the nose, but the power of these latter is very limited. When a sneeze occurs, all these faculties are excited to a high degree. When a grain of snuff excites the olfactory nerves, the brain instantly sends a mandate through the motor nerves to the muscles saying: Cast it out! and the result is unmistakable. So offensive is the enemy that the nose is not left to its own defence. It were too feeble to accomplish this. All the allied armies of muscles join in the rescue—nearly one-half of the body, arouses against the intruder—from the muscles of the lips to those of the abdomen, all unite in the effort for the expulsion of the grain of snuff.

The greatest intensity of cold on record, is that produced by Natterer, who, by means of bisulphide of carbon and protoxide of nitrogen, brought the thermometer down to 220° below zero, Fah. Faraday, by employing a bath of carbonic acid and ether, *in vacuo*, obtained an intensity of 166° below zero, Fah.

## Weekly Stock Circular.

Of Associated Brokers of the S. F. Stock and Exchange Board.

SAN FRANCISCO, SATURDAY MORNING,  
April 13, 1867.

## CITY STOCKS.

City shares were quite active during the period under review. California Steam Navigation Company receded from 71 to 60 3/4 cent., then rallied to 71 1/2. S. F. Gassold at \$68.50@64 per share, and Spring Valley Water at \$67.50@66. The latter company paid its usual monthly dividend on the 10th instant. The Pacific, Union, and California Insurance companies disbursed their usual quarterly dividends—6 3/4 cent., and the National Insurance Company will pay 3 3/4 cent. on the first of May, for the quarter ending March 31st. The Bank of California pays a dividend of 1 3/4 cent. per month on the 15th instant.

## MINING SHARE MARKET.

We present below the bullion yield of ten companies located on the Comstock vein during the first quarter of 1867, as compared with the product of the same period in 1866:

COMPANY.	FIRST QUARTER IN 1867.				FIRST QUARTER IN 1866.			
	January.	February.	March.	Total.	January.	February.	March.	Total.
HALE & NORCROSS	\$102,711.72	\$111,699.44	\$173,444.02	\$387,855.18	\$140,000.00	\$150,000.00	\$110,000.00	\$400,000.00
Savage	200,000.00	270,000.00	150,000.00	620,000.00	150,000.00	150,000.00	110,000.00	410,000.00
Ophir	140,000.00	120,000.00	64,411.58	324,411.58	155,451.63	145,451.63	356,341.12	457,244.38
Yellow Jacket	156,200.37	117,453.97	109,313.85	382,968.19	111,734.13	85,000.00	96,519.65	293,253.78

Confidence	22,494.21	11,388.74	8,433.04	42,315.99	19,474.12	10,411.19	12,474.01	42,359.32
Ophir	.....	.....	.....	.....	.....	.....	.....	.....
Total	\$971,730.97	\$934,539.56	\$953,428.92	\$2,859,699.45	\$671,655.41	\$602,160.72	\$317,177.13	\$2,590,993.26

BULLION PRODUCT OF THE LEADING CLAIMS ON THE COMSTOCK VEIN.

\$2,330, and closing yesterday at \$2,490. During the week ending April 6th 2,099 tons of ore were extracted, showing an assay value of \$84,929, equal to \$40.46 per ton; previous week, \$36.32 per ton. Of this amount of ore 77 tons came from the old works, 331 from the 6th station, 1,105 from the 7th, and 586 from the Curtis shaft works. The third station drift in the Curtis shaft has been carried about 50 feet towards the vein. Sinking for the fourth station has been resumed. During the week under review most of the laborers were employed in the north mine, the difficulty in hauling the ore from the Curtis shaft dump at this time necessitating a temporary stoppage of work in that portion of the mine. This company paid a dividend of \$100 per share on the 8th instant.

YELLOW JACKET—has been sold to a large extent at a marked advance over our last quotations, rising from \$945 to \$1,145, falling to \$1,060, advancing to \$1,126, and closing at \$1,151. From the March balance sheet of this company we extract the following: Receipts, \$110,316.53; expenses, \$94,783.30; assets, \$96,904.97; and liabilities, \$80,210.48. The ore worked during the month amounted to 3,074 tons, showing an average yield of \$35.92 per ton. The bullion receipts during the first quarter of 1867 exceeded the returns of the same period in 1866, \$89,289.41.

CROWN POINT—jumped from \$910 to \$1,425 early in the week, then realized \$1,250 @1,300, and closed yesterday at \$1,355. This marked appreciation is based on the discovery of a body of ore 150 feet east from the 500-foot level, which, it is said, will yield \$40 to the ton. This body of ore it is thought will extend downward. The drift from the 400-foot level above did not encounter it. The west drift from the 500-foot level is in 100 feet, but work has been suspended for the present on account of the presence of a large body of water. This company disburses a dividend of \$80 per foot on the 15th instant, and will carry over a cash surplus of \$44,530. They reduced 1,759 tons of ore during the month of March, averaging \$36.69 to the ton.

GOULD & CURRY—advanced from \$370 to \$390, seller 30, and closed at \$390, buyer 30. The bullion yield of this company was \$285,913.70 less during the first quarter of 1867, as compared with the same period of 1866.

CHOLLAR-POTOSI—sold largely since our last reference, advancing from \$295 to \$350, then selling at \$330@325, and closing at \$340. The Santa Fe station is said to continue to look well, and a wuzze sunk from this level, at a depth of eight feet, also looks well. The Blue Wing station development, in raising up, shows a body of ore from 15 to 20 feet wide. During the week ending April 6th, 1,481 tons of ore were sent to custom mills; previous week, 1,342 1/2 tons.

IMPERIAL—advanced from \$247 to \$260, and closed at \$262.50. This company disburses a dividend of \$15 per share on the 15th instant.

OPHIR—improved from \$238 to \$255, then sold at \$240@263, and closed yesterday at \$287.50. Work on the south drift from the tenth level is steadily continued at the rate of about five feet per day, in good ground, and carrying the east wall on the right. The Ophir grade road is again in a passable condition, and the revenue from this and the mill at Washoe is again helping to pay mining expenses.

EMPIRE—sold at \$175@165, and closed yesterday at \$162.50. BELCHER rose from \$115 to \$190, then sold at \$147.50@157.50, and closed at \$172.50. The KENTUCK Mining company paid a dividend of \$150 per foot on the 10th instant. On the same day \$1,500 per foot was bid for this stock. SIERRA NEVADA levied an assessment of \$4 per share on the 10th instant.

The aggregate sales of stocks, Legal Tender Notes, etc., since Saturday last, amounted to \$1,141,006.

CALIFORNIA HANDIWORK FOR PARIS.—J. D. Boyd sent by last steamer, an addendum to his original contribution for the Paris Exposition, in the shape of a sample billiard table leg, of a new pattern designed by himself. It is of carved laurel; and the ground-work being colored and polished, the carved portion is left of the natural color in relief, and apparently of some other kind of wood. Mr. B. also sends specimens of our native cabinet woods.

## SALES OF THE WEEK

BY THE S. F. STOCK &amp; EXCHANGE BOARD

## Monday, April 8.

6 shs Confidence at 35 per share.  
20 shs Sierra Nevada at 5 per share.

Amount of sales.....\$177,675.00

In the above statement it will be observed that the yield of nine companies during the first quarter of 1867, as compared with the product of ten companies in the same period in 1866—including Ophir, which company reports no yield in the present year—shows a gain for 1867 of \$387,690.76. Want of space prevents us making further interesting comparisons.

The mining share market, owing to a very material advance of several stocks early in the week, became considerably excited, and sales were quite large. At the close the market is firm, and the recent advance continues to be well maintained in most shares. The developments are of an encouraging nature, and inspire great confidence as to the future yield of the Comstock vein.

HALE & NORCROSS—continues out of the market; during the week \$3,400 was bid per foot. The bullion receipts during the month of March were considerably less than in the previous months of January and February, owing to stoppage, etc.; but the yield of the first quarter of 1867, as compared with that of 1866, shows a gain of \$183,749.82. This company disburses a dividend of \$125 per foot on the 15th instant.

SAVAGE—sold at greatly improved figures, opening at \$2,175@2,190, then selling at \$2,090 ex-dividend, advancing to \$2,200@

## Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

## CALIFORNIA.

## Alpine County.

From the Silver Mountain *Bulletin* of March 30th: The shaft in the Geo. Washington mine was on Saturday, down 52 ft., nine ft. having been made during the week. The water has increased and but little more can be done until the pump arrives. The east drift is now in 35 ft. from the main tunnel; the rock much softer. The ledge at the bottom of the shaft is widening—the pay streak having increased one foot.

The Illinois, California Co. have got through the 500 ft. of hard granite and entered a quartzose rock full of seams, indicative of something rich ahead.

## Butte County.

The *Record* says: It is proposed to wash the bluff into the river. A three-foot sluice, capable of carrying 500 in. of water, will be laid down. If this should be successful, operations will at once be entered upon that will give employment to at least 500 men, exhaust the water of the Feather and Ophir Co's canal, and wash hundreds of otherwise comparatively useless land into the Feather river.

## Calaveras County.

West Point correspondent of the *Chronicle* of April 6th: At Enterprise Flat, one mile from town, some splendid veins of rich ore have been developed. On this flat is located the celebrated Gouldsen mine. Mr. Gouldsen has, by drifting, discovered large bodies of rich ore on each end of the old works, and has out now ore that will yield twice as much as was taken from the mine last season. Willis and Johnson are now mining splendid ore. A few tons crushed a few weeks since yielded near \$100 per ton. The Torch Light, owned by Briggs, Everhardt & Co., is yielding good ore. On the same range, is a good mine owned by Jeff. Wilson & Co. Ore recently crushed from this mine yielded over \$100 per ton.

Messrs. Harvey & Hawk, formerly of Volcano, are working the Zacatara mine, on contract, and have out a large quantity of splendid ore. At Cator, three miles east of town, Congdon & Mocher have a good lead and have out a large amount of rich ore; so also have Keys & Postens, in the same vicinity. Mr. Bougliuval, owner of the Oro Plata mine, is prosecuting work vigorously. Morris & Co. are proposing to wash the tailings from the Mina Rica mill by a new process, recently invented by Mr. Morris.

Camanche letter to same: Since the prospect of water at Cat camp, 200 claims have been taken up and recorded. Miller & Co. have found the richest prospects thus far. J. Zimmermen & Co. have washed out, by panning, from \$4 to \$5 per day. Coburn & Travis have a claim from which, with a rocker, they take from \$10 to \$15 per day. There are from day to day from 20 to 30 men prospecting, and many have been equally lucky. There are now in operation over 100 rockers, run by Chinamen, on this ground, which is over four miles square, every foot of which contains gold. It is common to obtain ten cents per pan, and from that up to \$27.

## El Dorado County.

Kelsey correspondent of the *Placerville Courier* says the Bald Eagle is rich and all right, but the owners are still in a muddle.

From the *Democrat* of April 6th: A company of gentlemen from Sacramento county have located two quartz claims on Hangtown Creek, a short distance below Middletown, in the Placerville mining district. The Crook's ledge is on the north side of the creek, the Howe ledge on the south side—3,000 feet in each claim. The ledges at the depth of 12 ft. are three ft. thick. Specimens taken from them at this depth show plenty of free gold, and the sulphurets are filled with it.

## Kern County.

From the *Havilah Courier* of March 30th: At the last clean-up of the Belmont mine, Washington Dist., worked by Lyons, White, Law and others, 18 tons of rock yielded \$1,910—besides \$300 or \$400 left in the arastra. There is plenty more of such rock in the Belmont.

## Los Angeles County.

From the *News* of April 2d: Dryden & Hahn have discovered a rich extensive vein of ore on the ranch of the Sisters of Charity, 16 miles from this city. The vein is over 1,000 yards long, with an average width of 15 ft. long; an assay reveals 75 per cent. of pure metal. The discovery is the more important from the fact that there is an extensive coal mine within 50 miles. The ore can be laid down in San Francisco for \$14.50 per ton.

## Mariposa County.

From the *Gazette* of April 6th: William Brown found in Greaser Gulch, the other day, a piece of gold weighing 51 ozs. and \$3. The same claim has been paying for the last month from \$4 to \$8 per day.

Hogan & Co., who are working the adjoining claim to Brown, have taken out \$500 in the last month.

The mining region about the town of Indian Gulch, near Greaser, is as good, if not better, than any other in the State, for the reason that there has never been water for a sufficient length of time to work out a single claim.

Coulterville letter to the *Mail*, April 6th: Capt. J. M. Aiken is the owner of one of the most promising ledges in this vicinity. It lies about three miles southeast of this place, and from the vein it is of easy grade to the Merced river. The mine, I understand, is in market.

Messrs. Coward & Ralston design erecting machinery in the summer on the Marble Spring property.

Much energy is being exhibited in the Bull Creek region in mining, but no results need be expected before summer.

In the case of the Mariposa Co. vs. Dodge Bros., the Supreme Court has granted an injunction restraining them from selling or intermeddling with the property, and appointed a Receiver.

## Nevada County.

From the *Gazette* of April 4th: The 15-stamp mill of the Lucky Co. crushes 30 tons every 24 hours, at an average yield of \$20. The incline is down 275 ft., and the vein 2½ ft. wide.

Same of 5th: A large and promising quartz ledge was discovered a few days ago, by the Kelsey Bros., east of and parallel with the Banner. A working test gave \$30 a ton.

Work in the Allison Ranch mine will be resumed in about two months. The company is now working over and grinding in pans the tailings which have been accumulating for some years, and of which they have several thousand tons on hand. The tailings are paying about \$15 a ton, and besides are yielding nearly as large a proportion of sulphurets as when first worked.

Same of 8th: We have conceded the quartz mines, in the past to Grass Valley, but the evidences are plain that Nevada will dispute the palm with her sister town, at no very distant day. Our quartz mines are showing splendidly. The Wigham, the Banner, the Norridgecock, the Cunningham, the Sneath & Clay, and the Union, are among the best mines in the county. If 19 out of 20 of the quartz ledges about Nevada shall fail, the future prosperity of the section is assured.

Same of 9th: Merrow, Cobb & Co., hydraulic miners at Scotch Flat, cleaned up on Saturday last, after a run of 11 days, the yield being \$2,540. This is at the rate of over \$200 a day, and is more than double the yield of former clean-ups.

Same of 10th: The Golden Gate Co. at North San Juan, cleaned up on Sunday last, after a run of 14 days, taking out \$6,000. These claims have not been paying very well heretofore, but the owners feel much encouraged by their late run.

From the *Transcript* of April 5th: A rich ledge was discovered on Wednesday last, in Deer Creek, about a mile and a half below town, in Leeth & Co's gravel claims. The rock is filled with rich sulphurets, and the ledge is compact, and is about three feet wide.

The Amazon, on the ridge beyond the Star Spangled Banner, has been opened to the depth of 90 ft., and gives evidence of richness, though none of the rock has yet been worked.

Same of 10th: On the Birchville ledge, a tunnel has been run in 100 ft., and the ledge tapped 60 ft. below the surface, is three feet wide. In a month 45 tons of excellent rock were taken out. A working test, made in a hand mortar, yielded at the rate of \$500 per ton.

The mines at Birchville are yielding handsomely. Last week the San Joaquin Company, after a run of twenty-four days cleaned up \$17,000. The Kennebec Company, after a run of twelve days cleaned up \$7,000. Other hydraulic claims are also paying well.

A company has been formed to develop the ledge on Albion Hill.

Spenceville, which was almost deserted after the copper excitement subsided, is looking up again.

From the Grass Valley *Union*: At a distance of thirty-seven feet from the southern boundary of the Lone the Union Jack, at a perpendicular depth from the surface of eighty feet, shows a ledge about six feet in width, the rock by mill process having paid \$16 a ton, the expenses of extracting and crushing being but \$8 a ton.

The owners of the La Crosse mine have recently perfected arrangements with San

Francisco parties for the erection of hoisting and pumping machinery, which, by the terms of the contract, is to be running by the first day of June next.

EXCELSIOR.—From the Nevada Meadow Lake *Sun* of April 6th: As the Mohawk and Montreal companies proceed downward with their shaft, on the second level of their mine, the ore seems to increase in quantity and richness.

From the Territorial *Enterprise* of April 7th: We saw a quantity of excellent looking ore from the Mohawk and Montreal mine, Excelsior District, four assays of which, made by different assayers in this city, yielded at the rate of \$65 to the ton. The mill is nearly completed and will start into full operation about the first of next month.

## Placer County.

From the *Stars and Stripes* of April 3d: The Golden Gate adjoins the Dewey claim, at Bath, and is owned by Henry Ford, John D. Jones, and three brothers named Willetts. Unlike the Dewey, the Golden Gate is a bedrock claim. The company have a convenient mill near the mouth of their tunnel which runs five stamps and works night and day. The Golden Gate employs about 15 men, and regularly nets to its owners from \$250 to \$300 each, per month. The tunnel is about 1,100 ft.

Colfax letter to the *Dutch Flat Enquirer* of April 6th: The Mountain View claim, Cape Horn, has a vein from three to five ft. wide. It prospects well. The Lone Star is worked by one man, who, alone, has sunk a 65-ft. shaft. The Colfax lode is being worked night and day.

## Plumas County.

From the Quincy *Union* of March 30th: McGee & Thompson, who have been at work day and night for seven months, running a tunnel on the Mammoth ledge, struck through last week at 1,700 ft. The rock is rich. The vein is four ft. wide. The Eureka (Parrott & Co., San Francisco) has out 400 tons of good rock.

## Shasta County.

From the *Courier* of April 5th: Last week, Hunter & Mozier, at Church Hill, cleaned up \$500 from a 10 days' run. The workmen on the Highland lode, at French Gulch, are taking out some very rich rock.

At South Fork work has been resumed on the Crystal lode, and fine prospects obtained. A controlling interest in the Pacific has been sold for \$1,200.

At Dog Creek times are quite lively. The McCall Gulch claim pays \$50 per day. On Saturday, the proprietors took out two specimens—one weighing 12 and the other 3½ ozs. Pieces weighing from \$3 to \$5 are found in this claim almost daily. Baylis & Myers have struck a rich pay streak in their claim on Sailor Point. Robert Pitt is working a claim on Portuguese Flat, eight miles above here, which pays from \$8 to \$10 per day to the hand. Mason has lately struck a quartz ledge on the South Fork of Dog Creek, which prospects over \$1,000 to the ton.

## Sierra County.

From the Downieville *Messenger* of April 6th: We learn that the Keystone mill recently cleaned up \$10,000, after a run of six weeks. A Chinese company have commenced mining operations in the river below town by putting in a wing dam. The Blue Nose Tunnel claims, on the divide between Nelson and Hopkins' Creek, have struck good pay—nine car loads paying \$30. The Monumental claims, at Potosi, recently reached "pay dirt" that prospected from \$10 to \$14 to the pan.

## Siskiyou County.

From the Yreka *Union* of March 30th: Geo. Scoles cleaned up, last week, at the rate of \$65 to the ton. Hall's claim in the gulch is paying very well. The claim owned by Mortimer & Scott is paying about one-half ounce per day to the hand.

From the *Journal*: The miners at Sawyer's Bar and on Salmon river are doing better this season than since 1856. The quartz leads and placer diggings are paying extraordinarily well. The Black Bear company is taking out a great quantity of rock, which pays exceedingly rich.

## Tulame County.

From the Sonoma *Herald*: The Wyoming claim, belonging to the Haskell Bros., of Shaw's Flat, had crushed 15½ tons of rock, which yielded \$114 per ton.

## Yuba County.

From the North *Californian* of April 9th: The shaft of the Blue Point Co. is down 16 ft. Last week the Blue Gravel Co. put off a blast in which 300 kegs of powder were used. It is described as having, to appearance, raised the mountain some feet.

Camptouville letter to the *Appeal* of April 2d: The True Grit Co. have struck very soft rock. Griffiths & Co., at Kentucky Hill, have struck gravel. Work on the Fiddletown ledge is progressing nicely. Operations upon the copper claim of McKim &

Newhery will be commenced again in a short time.

## ARIZONA.

From the *Miner* of March 9th: The Sterling mine is doing well. The difficulties heretofore experienced in amalgamating are gradually being overcome. The Aztlan mill of 10 stamps, lately erected on the Umpqua lode by Noyes & Curtis, is one of the first class.

Letter from Hardyville to same says: B. H. Coit has arrived, with the purpose of working his mine, the Pride of the Pines, in Waba Yuma District.

H. H. Moore, just returned from Arizona, writes thus to the *Alta* of April 7th: The Vulture lode, opened four years since by Henry Wickenburg, paid, for two years, with arastras, an average of \$100 per ton. Since it has been worked with more elaborate machinery, it has averaged \$70 per ton. A large new mill is to be erected. The gold is free. Some Montana miners are reported to have discovered a vein of the same kind 25 miles east of Wickenburg. The other prominent gold quartz leads found north of the Gila, are nearly all situated within a circuit of 30 miles from Prescott. The veins upon Lynx Creek, 14 miles east of Prescott, are the most numerous, if not the richest, to be found in Arizona. The most worked of any being the Accidental, owned by Bowers and others, of Prescott, who have prospected it with results amounting to about \$100 a ton, by means of a two-stamp mill. K. S. Woolsey has lately completed a five-stamp mill, to run by water-power on the Agua Fria, a branch of the River Verde, about 25 miles east of Prescott. The Colonel is working rock in the mill from the very rich leads known as the Ticonderoga, Green Tree, and others discovered and owned principally by him. He is also setting up one of the Thunderbolt crushers near these leads, intending to give that machine a fair trial in comparison with stamp mills. The mill of the Moss company, on the east bank of the Colorado, about a mile above Hardy's, is one of the most complete in the Territory. It only awaits the arrival of Mr. Strong, the superintendent, to commence running. \* \* \* \* \*

The dry washing process, practiced principally by Mexican gambusinos, produces in the aggregate no considerable amount of gold. Copper and silver are also mined for by these gambusinos, and sometimes with results astonishing to the white miner. Machines for dry washing have lately been taken to Arizona, many portions of which contain the richest placers, without water near them, and especially adapted to that mode of working. As these machines are not costly, and may be packed about upon mules, they are likely, if of the right kind, to prove profitable to those introducing them.

The average yield of gold from all parts of Arizona, in the aggregate, may be estimated at the present time to be from \$4,000 to \$5,000 a day. That of the other metals cannot be easily estimated. But in the course of the present year, a considerable increase in the yield of gold and of all the other metals found in the Territory may be confidently predicted.

## COLORADO.

From the Denver *News* of March 13th: Some very fine specimens of argentiferous and gold-bearing galena, from the Lamberston & Warren lode, on Nevada Hill, were shown us the other day.

From the same of March 20th: Boulder county is looking up. Ward, James, and St. Vrain's Districts will contain a great number of miners the coming season.

More placer or gulch diggings will be worked this year than there has been since 1860. Development of lodes discovered within the past two years will be carried on with vigor.

From the Colorado *Times* of March 12th: The Smith & Parmelee Co. are now sinking their pump-shaft, and propose to drain the entire property on the Briggs and Gregory lodes.

We saw this morning a gold retort weighing over 122 ozs., the result of last week's run of Alps & Grenada Co's 12-stamp mill on six cords of ore; and another of 156 ozs. from the Gunnell Co's mill.

Letters have been received from various parties now in the East, expressing their determination to come out in the spring, with capital and machinery, to develop the silver wealth of Griffith Dist., Georgetown and surroundings.

Same of 15th: A private letter from a Colorado man in New York, says: "Prof. Hill is back from Europe. He reports the complete success of Herman's process; says he is now fully satisfied. The ore from the Brastow Co's mine, (Bobtail lode) yields in coin \$251.40 per ton. There were 80 tons in all. The Fiske ore yielded at the rate of 110 ozs. per ton." It must be remembered

that the "Fiske" is one of our refractory ores and did not pay in stamp mills.

Same of 19th: Mr. J. T. Herrick had a handsome silver "slug" in his hand here yesterday, which weighed 8½ ozs. and was taken out of only six lbs. of the ore from the Anglo Saxon ledge, Georgetown Dist.

A retort weighing over 134 ozs., was the product of the Leavenworth 12-stamp mill for the last six days.

For the week ending March 12th, the Black Hawk took out 225 ozs.; Smith & Parnell, 75 ozs.; Kimber's mill, for W. H. Cushman, 68 ozs.; Ophir Co., 62 ozs.; Sensioner, 140 ozs.; Mr. Keith, 90 ozs.; Consolidated Gregory not yet reported.

#### IDAHO.

From the *World* of March 23d: We are informed that the ditches all about here are nearly ready for the mining season, and that the water will be turned into them, as quickly as the miners are ready for working their claims.

A. Cave writes his brother at Idaho City from Leesburg, Leuihi, Feb. 22d, as follows: This place is rapidly filling up with people, and I suppose there is a good deal of excitement about these mines on the outside. It may be a good mining camp, and I hope it is; although those who have been here the longest and ought to know the best have but little faith in it. There is a pretty large extent of country located, and I think that some of the recorders will make more money than the locators.

Large crowds are leaving Virginia City and Helena, Montana, for the Salmon River diggings. It is said that food is scarce at the diggings.

The *Lewiston Journal* of March 20th, says: We learn that the copper ore of the Eagle Creek country is found to be easily worked and reduced, and that the steamers are ready to contract to ship it from Wallula to Portland for \$20 per ton. Preparations are being made on a large scale to mine this copper.

From the *Owyhee Avalanche* of March 30th: A. J. Sands & Co. are to work the Oro Fino mine jointly with the O. F. & M. S. company. During the week the snow was removed, and the ledge found some distance south of the discovery shaft. Fine gold was found in some of the rock taken therefrom.

We have it from a source entitled to credit, that a heavy company has been organized in New York with a view to prospect for mines in Owyhee, and will early in the summer commence operations.

Two Iowa companies will soon commence work in this Dist. extensively; the New York and Owyhee company will largely increase its labor soon; the Cosmos is adding to its list of workmen, and the Oro Fino and Morning Star company will require a heavy force within a month. We only mention the certain operations, while there is the best of reason to believe that double the labor will be needed that we have indicated. The news from Flint is of the most cheering character.

A letter to same from Rocky Bar, Alturas county, gives these items: The Waddingham and Idaho mills are still running, and doing well. The Idaho company are taking out extraordinarily rich rock. Big stories are told of their two last clean-ups. At Red Warrior the mills are all silent—not from the want of rock, but on account of the manner in which companies operating there have been managed. Mr. Howard has got out 200 tons of good rock from the New York ledge. Marx & Van Wyck are pushing their work on the Bonaparte ledges, and have flattering prospects. At the Yuba a great deal of work has been done. Wm. Johnson has struck the Minerva, and it is a wide, rich ledge.

Stevens, Taggart & Co. have a tunnel in on their ledge, the Grey Eagle, and have a shaft some 40 ft. deep; where the tunnel strikes it the ledge is over 10 ft. wide, and yields extraordinary prospects.

Col. O'Neil, now in San Francisco, will start in the spring with a 20-stamp mill for Yuba.

Mr. Matthew Graham has been developing the Eclipse, Lucy Phillips, Atlanta and Silver Tide.

The Greenback company, (Defrees Co.) have got out 500 tons from M. C. Berge's claim on the Atlanta. The shaft is down about 40 ft.; ledge over 20 ft. wide.

#### MONTANA.

From the *Post* of March 23d: The Hawk-eye mill was only run a portion of the week. Col. Postlewaite, yesterday, deposited 143½ ozs. of retort, valued at \$2,583.

We noticed yesterday, a very fine retort, the first product of the Christmought mill, which is said to work beautifully. The erection of the machinery is not yet fully completed, and no regular run had been made; but such rock as they have crushed from the Oro Cache, has yielded fully \$100 to the ton.

On the shaft of the Ore Cache No. 2, from which ore is now being taken, there is a well defined crevice of three ft. In addition to this, the company have been running a tunnel to tap the General Grant lode, which they have struck at 150 ft. At latest advices they had penetrated the vein nearly eight ft. and had not yet worked through it. The quartz is said to be of excellent quality.

Letter to same from Rabbit Dist., has the following: Miles Cavanaugh has a shaft on the Valley lode some 25 ft. in depth, with a splendid body of quartz. Mathiuss and Powers have commenced a shaft on discovery claim of the Watseka. At a depth of 10 ft. they have a 15-in. crevice of solid brown iron quartz—and very rich, almost every piece showing gold visible to the naked eye.

Letter from Butte City, March 7th: This new promise to be a good camp. It has lodes of inestimable richness. There is almost an unlimited amount of side hill placer mines below the ditches that are now nearly completed. Everything relating to these claims is, of course, "on the square." There is not a very large portion of the miners here that have got over 30 or 40 claims each.

Helena items: Mr. Deidesheimer, Superintendent of the St. Louis & Montana Mining Co., informs us that the works are fully prepared to turn out silver by the ton, as soon as the weather moderates. It seems rather sanguine to speak about turning out a ton of silver every fortnight, but the figures warrant it. The rock yields on an average, \$320 per ton. The capacity of the works is ten tons per day, yielding \$2,976; in fourteen days, \$41,664. Rating the silver at \$16.30 per lb., the yield in fourteen days would be 2,566 lbs., leaving a large margin for contingencies.

Three tons of Legal Tender ore gave a 70-lb. button worth \$1,141, a day or two since.

#### NEW MEXICO.

From the *Wilmington Journal* of March 30th: The Pinos Altos Mining Co., consisting of Messrs. Masten, Jones, Amberg, Reynolds and Griggs, have just erected a 15-stamp mill at Pinos Altos, 200 miles east of Tucson, and 100 miles west from the Rio Grande. They are now about commencing crushing rock (gold bearing quartz). Their ledges are said to be very rich in gold and silver; and have been worked with good results by the arrastra process. Other mills are to be put up in the Pinos Altos Dist. this summer.

#### NEVADA.

##### Black Rock.

The *Marystown Appeal* of 6th inst., says: We were shown yesterday at the assay office of Knight & Co., a silver bar, the product of a mine in the Black Rock Dist., which is the property of Judge Harvey, now a resident of this city.

##### Esmeralda.

From the *Aurora Union* of March 30th: The confidence in the mineral resources of this county which was almost destroyed by reckless speculation in "wild cat" in 1863, is being gradually restored. Winters & Co. have developed the Juniata lode to a considerable depth, and find it well-defined and large. From Pine Grove and other outside districts, we expect during the coming summer to realize a handsome revenue.

Henry K. Mitchell, a Virginia City prospector at Pine Grove, Walker River, gives the *Trepass* of April 1st, these items from Wilson's Dist.: Fifteen tons of ore daily, are now being taken from near the surface on Wilson's ledge. It is worked at Todman & Co's new 10-stamp mill, and averages \$40 per ton. Work is being prosecuted on the Midas tunnel night and day. It is in 200 ft. On the claim of the Reese River Co., half a mile north, the shaft is 30 ft. deep. The vein is from six to ten ft. wide. Next comes the Imperial. Next the Wheeler. On this the ore is being worked in arrastras, and averages \$50 per ton.

The same writes thus of Washington Dist.: Messrs. Todman, Cheever & Co. own four ledges half a mile from the river. A tunnel running diagonally into the precipitous hill side, will in a distance of 500 ft. cut all four of these ledges at a depth of 300 ft. below the croppings. It is to be commenced in a few days. The ore a few feet from the surface shows chloride of silver. Southwest of these ledges is a mammoth lode, named the American Eagle—an extension of the Sea Fowl lode—which has been opened on the surface 25 ft. in width, and five ft. in depth. A quantity of the ore in Cheever & Todman's mill, returned \$4.15 in silver per ton. With proper appliances for reduction it is believed that the ore will yield double that sum. The mine will be prospected thoroughly this summer.

The Gold Hill *News* of April 2d, says: A Swede, named Sanders, who keeps a store at Pine Grove, Wilson Dist., Walker River, came to Gold Hill this morning, bringing with him some ore, which he submitted to

an assayer, and found to be silver ore, worth \$32 per ton. Mr. Sanders says that the ledge from which this ore was taken is not less than 50 ft. wide, near the surface; and the prospectors were about to abandon it because they could find no gold in the rock.

##### Humboldt.

From the *Register* of March 30th: On the Goleonda, White & Webb are now down over 125 ft. with their shaft. At this depth they find a well defined 10-ft. vein of solid ore. They have a mine of incalculable value.

A company in Pueblo Dist., intend to purchase the old Webber mill at Oreana, which is now idle, having been superseded by the furnaces. We understand they have a very large and valuable mine, and have now outside 400 tons of ore, with unlimited quantities in sight of a very fine quality.

A. W. Nason shipped from the Montezuma, by Wells, Fargo & Co's Express, 2,836 ozs. of bullion, the value of which is \$3,415.70.

A party of prospectors intend to explore the country about Gravelly Ford, on the Humboldt river, and that lying between Paradise Valley and the Goose Creek range of mountains. They will start as soon as the weather permits.

Letter to same from Star City, says: The American Basin Co. has just put on an extra force of hands and will crowd its work as fast as possible. The Yankee is driving ahead as usual; so is the Almira. I learn the De Soto Co. will resume work soon. The Little Giant just across the mountain, in Santa Clara Dist., is looking well. McBeth has a tunnel in 130 ft. and is highly elated with his prospects.

The Virginia *Trepass* has seen a private letter from Lake City, Surprise Valley, 160 miles north of Virginia, in which appears this item: Yesterday news was received in town that some marvellously rich placer diggings were discovered on the 13th of March, at the head of Pitt river, about 20 miles from here. Several pieces of gold have been dug which were worth \$20 each, and quite an excitement prevails relative to the matter. The gold is very fine, and a number of men have already left for the reported new diggings, and more are about to leave.

The Forty-Nine lead on the east side of Surprise Valley, is creating some excitement among the settlers. It is supposed to be rich in silver. So says the *Enterprise*.

##### Pahranaagat.

The Salt Lake *Vedette* gives the following items from Mr. Wm. H. Henry: Dr. Congar, after erecting smelting works at Logan Springs, found the character of the ore below the surface so changed as to require a mill in addition. He is now erecting it. The mill of the Pioneer Co., represented by Mr. Raymond, is located 12 miles from the mines, for the sake of water. Nichols & Kennedy have a vein of water in Silver Cañon which flows 1,000 gallons per day.

The Crescent Co., represented by Mr. Julius A. Bidwell, are pushing forward the development of their mine with vigor, and are also making preparations for their mill at the Hatfield Ranch, where abundance of water has been obtained at a trifling expense, and only about one mile from their mine. There are three tunnels on the Illinois. In one of these, a small vein of silver ore, of rather rebellious character, has been struck. A shaft is being sunk in the Webster, and some prospecting being done on the Virginia Silver, both of which carry very rich ore at the surface. On the Cincinnati, and Ely & Sanderson, work for the present has been suspended. I visited the wonderful List lode. It has remarkably bold, and continuous outcroppings, and not an indication of another lode is found within a mile of it in any direction. It is, undoubtedly, second to none in richness. Dr. Congar has taken out at least \$50,000 worth of ore, ready for crushing. Shares are now held at \$500 per foot. This district has, in my opinion, a bright future.

"S. A. R." writes the same from Hyko, March 15th: "In this district the mines are in the very best possible position for saving labor; deep cañons are natural shafts from which tunnels can be run to great advantage, thus doing away with sinking shafts and expensive hoisting apparatus. I think they will be worked as cheaply as any mines in the State."

"One mill has been erected for prospecting purposes; three more are on the ground ready to be erected as soon as building materials can be procured, with the prospect of having four more here before July, making in all 100 stamps."

##### Reese River.

From the *Reveille* of March 28th: The store, yesterday, brought 3,000 ozs. of crude bullion from the mill of the Social and Step-toe Co., at Eagan Cañon. Eighteen tons of ore from the Taylor & Passmore mine, Cor-

tez Dist., was delivered yesterday at the Knickerbocker mill for reduction.

We have just heard from Cortez Dist. The stratum of pay ore in the Cortez Giant, at the point of excavation, is from 16 to 18 ft. thick. As soon as the snow disappears, work will be commenced on the St. Louis and Nebraska.

Same of 29th: "Ned" writes us from Mammoth, that Capt. Knapp will resume work on the great shaft of the Mount Vernon, by the 1st of next month. J. C. Merrill has commenced a shaft to ent the Albany 100 ft. below the surface. The Tyler Bros. have struck a good vein of mineral in the Sunlight. Ferguson & Co. are putting down the shaft in the American Flag.

At Belmont work is being prosecuted on the Silver Champion. The Silver Cord increases in width.

Same of April 2d: Matters are quiet at Silver Peak on account of the deep snow. Four bars, valued at \$3,687, came in last night from the mill of the Twin River Co. The Knickerbocker mill sent in for assay 1,540 ozs. of bullion.

Same of April 3d: Five bars, worth \$4,673, came in last night from the mill of the Twin River Co.

Same of 4th: Eight and a half tons of chloride ore from the Magnolia, sent to the Keystone mill for reduction, yielded \$3,486.

The Rigby mill at San Antonio was put in motion last week.

Eighteen tons of Taylor & Passmore rock averaged over \$200 per ton.

Same of 5th: Eight bars, worth \$7,794, came in to-day from the Buell mill at Belmont.

Mr. Seitz has taken out of the Liberty mine, San Antonio Dist., 100 tons of ore, of which 60 tons is first class ore, yielding \$270 per ton; the second class will yield from \$100 to \$125. The Rigby mill hauls and works the rock at the rate of \$75 per ton. This mill has two large stamps, and is 14 miles from the mine.

The Virginia *Enterprise* of April 3d says: Of all the outside localities talked of at the present time, Silver Bend seems to be the favorite. Several parties have already left here, and others are leaving almost daily, for that new land of promise, where every ledge is pregnant with bullion, the boulders are black with rich sulphurets, and everything that glitters is gold and silver.

##### Washoe.

[In the Stock Circular, in another portion of this paper, will be found late mining news from this district.]

From the Virginia *Enterprise* of April 4th: "All the workmen who have been employed in the upper works of the Gould & Curry mine have been discharged, all paying ore having been extracted from the upper levels. The only work now being done is upon the main shaft, and this is being done by contract. The shaft is now down about 900 ft., and is being constructed in the best style in every respect. Once it has attained the intended depth drifts will be started to open new levels. In the meantime the mill will do custom work. So much for mismanagement in early times. The shaft that is now being sunk should have been commenced four or five years ago—this would have been better than building fancy duck ponds."

The Chollar-Potosi is yielding about 300 tons per day of excellent ore with plenty more of the same sort in sight. Quite a number of mills are kept constantly at work upon ore from this mine.

The water is being raised at a lively rate from the Sierra Nevada mine.

Same of 6th: The famous Yellow Jacket mine is yielding an unusual amount of rich ore at the present time. The Kentuck and Crown Point mines are also yielding splendidly. So is the Imperial. We saw a brick from the last named, worth \$7,514 yesterday; and twelve others, all from the Imperial ore, worth in the aggregate, \$54,000.

Same of 7th: The Hale & Norcross mine will yield no more ore for a week or ten days, we understand, as hoisting has to be suspended in order to make certain necessary repairs to the old shaft. The sinking of the new shaft will still progress as before.

From the Gold Hill *News* of April 3d: The Gould & Curry will, no doubt, when it attains sufficient depth, find the same body of ore that the Savage Co. are now working upon.

A new system of small coinage is now under consideration by the Government, with prospect of being adopted for future coins. The plan consists in having upon the center of the one-cent pieces a raised star, the nucleus of which is represented by a hole through the coin; the two-cent coins are to have two perforated stars, the three-cent coins, three.

## Mining and Scientific Press.

One copy, six months, in advance.....3 00  
For sale by Carriers and Newsdealers.

**American and Foreign Patents.**—Letters Patent for Inventions can be secured in the United States and foreign countries through the Mining and Scientific Press Patent Agency. We offer applicants reasonable terms, and they can rest assured of a strict compliance with our obligations, and a faithful performance of all contracts. For reference, we will furnish the names of numerous parties for whom we have obtained patents during the past two years.

## Canvassing Agents.

Our friends can do much in aid of our paper and the cause of practical knowledge and science, by assisting our Agents in their labors of canvassing, by lending their influence and encouraging favors. We shall send none but worthy men.

Mr. A. C. Knox, is our city soliciting and collecting Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office.  
San Francisco, Jan 15th, 1866.

Mr. L. W. Felton, is an authorized agent for this paper at Portland, Oregon, Dec. 1, 1865.

Mr. E. L. Smith is a duly authorized Agent for this paper, February 25, 1867.

Mr. Geo. P. Fitts is a duly authorized agent for the Mining and Scientific Press at San Francisco, March 23, 1867.

Mr. J. M. Quay will act as agent for the Mining and Scientific Press from this date. March 23, 1867. N

## San Francisco:

Saturday Morning, April 13, 1867.

## Notices to Correspondents.

N. R.—The word "CHEMIST" has usually been assigned by lexicographers as being derived from Greek roots, signifying juice, and to melt; others consider that it originated from the Arabic word *kema* (black); the latter is probably the correct view. Chemistry and chemist may be clearly traced as the abbreviations of alchemy and alchemist, "al" being the Arabian word equivalent to the English article "the"—as Al-Koran, Al-Boruck, etc., etc. It forms some corroboration of the view just given that alchemy and alchemists were the terms applied to the profession and professors of what was termed the "Black Art," during the Dark and Middle Ages. To Hermes Trimegistus, said to have lived A. M. 2076, has sometimes been assigned the eminence of being the first alchemist. His *Tractus Auricus*, or Golden Work, is, however, a farago of nonsense, and bears internal traces of having been compiled during the fifteenth and sixteenth centuries. Geber, an Arabian, is the first authentic professor of chemistry or alchemy, whose works have been handed down to us. Geber probably flourished somewhere between the fifth and seventh centuries of the Christian era. Alembics, crucibles, furnaces, and other ingenious apparatus, were described and depicted in his manuscripts, many of which, it has been supposed, he invented. Using the far-fetched, metaphorical language, so characteristic of the writers on alchemy, Geber writes: "Bring me the six lepers, that I may cleanse them;" by which he means the transmutation of silver, mercury, copper, iron, tin and lead, (the only metals then known) into gold. Dr. Johnson supposed that the word "gibberish," formerly spelled "geberish," is derived from this celebrated Arabian. Notwithstanding the hyperbole and metaphor employed by this writer, chemistry is indebted to him for much, as he certainly gave the initiative to all who succeeded him.

M. W.—We do not know of any rotary engine of large dimensions, in regular use. Probably thousands of smaller ones have been made, but they have generally been thrown aside as of little value. Probably not less than one hundred such engines have been illustrated in the *Scientific American*. The illustrated Patent Office reports will give you a very good idea of the efforts that have been made in that direction, and the various devices by which it has been attempted to use steam without a reciprocating motion.

G. P.—VIRGINIA CITY.—VANADIUM, commercially speaking, is a rare substance, though in some cases it is said to be most extensively diffused—thus, it is said, that it can be found throughout the whole mass of the London clay formation; though so sparsely that it can only be chemically detected. The chief source of supply is obtained from the vanadate of lead, found at Wanloch-head, Scotland, and at Zempán, Mexico. It is also and was first found by Seftstrom, in the year 1830, who discovered it in the ores of iron obtained at Taberg, in Sweden, and also in the slags of the reducing furnaces. Seftstrom gave to this metal the title of Vanadium, from Vanadis, a Scandinavian deity.

"Ye land o' cakes an' brither Scots,  
Frae Maiden Kirk to John O'Gaunt's—  
I rede ye 'tent it—  
There's a chiel amang ye takin' notes,—  
An' faith he'll prent 'em!"  
BURNS.

We give the above motto by way of warning to a large part of the California public, that our shortcomings in the way of colloquial terms, used in mining and the cognate sciences, do not pass uncriticized, reserving a proper share of said "warning" for our own editorial *lupus penna*.

In another column will be found a communication from Mr. Arents, in reference to our remarks made on a communication from him, which appeared in our issue of Jan. 19th, in reference to what he claims to be a new mineral. The letter contains many very judicious remarks which may be read with much advantage by our mining community generally, especially those parts which animadvert so justly on the loose, unmeaning and slipshod manner in which miners apply and use terms and phrases. The letter, however, contains some remarks which we think smack a little of the hypercritical, and others which, if adopted, would be found over-scientific for the general reader. As an instance of the first, we may mention that Mr. Arents lays it down as an axiom that a mineral is any substance in inorganic nature which has a homogeneous structure, certain uniform physical properties and a fixed chemical composition. Such may, and we are willing to admit is the meaning of the term when applied to strictly mineralogical classification; but by the mass of newspaper readers, very few of whom are mineralogists, the word mineral has a much wider significance, and we cannot therefore agree with the assertion of that gentleman that "the term (mineral) therefore excludes all mere mechanical compounds and only refers to substances which conform to some distinct chemical formula." Clay, sand, loam, etc., etc., are mineral substances which have no distinct chemical formula, and the mechanical admixture of all three, or less, in any and every proportion, pertain to the mineral kingdom. Coal is a general mineral term for substances varying from almost pure carbon to varieties containing more or less hydrogen up to bog-head cannell.

Rock, says Mr. A., quoting from Dana, in a strictly geological point of view includes not only the solidified compact portions of the earth, but also such soft or incoherent materials as clay, sand, gravel, etc., etc. In writing, however, for the million such precision is not fitting, and would not unfrequently be pedantic. To confine the meaning of terms to strictly scientific limits, a journalist, therefore, often feels himself occasionally, though reluctantly, compelled to employ words and phrases in the vulgar and more extended sense. In fact, geologists have, by admitting such terms as Oxford and London clays, Green and Hastings sands, etc., etc., fully recognized the advisability and advantage of employing terms eminently descriptive to ordinary minds, of the special physical characteristics of those "rocks." The term rock, however, as limited to its strict geological definition, is only an introduction of very recent date, and has not become entirely familiarized to even very old living geologists, and, as may be conceived, much less so by the bulk of persons who have not made that science a specialty. Having, as we think, said sufficient to show that even a "scientific journal" is not unfrequently justified in deviating, occasionally, from employing or applying scientific terms, in a strictly technical manner, we will now notice what appears to be Mr. A.'s principal complaint, which he states as follows:

"In my article on Partzite it was not my intention to give a description of the Blind Spring ores. What I intended, and did, was to describe a certain mineral, one certain homogeneous body which I found among these ores; and so long as it is not shown that this same mineral has heretofore been examined and described, and so long as no analysis of a mineral can be produced which corresponds to the formula established for

the Partzite, the latter is unquestionably to be recognized as a new mineral. It matters not if the same mineral occurs in other mining localities, and if years ago silver has been reduced from it."

We concur in the claim made by Mr. Arents in the above quotation; but at the same time Mr. A. will discover, on referring to our remarks of the 9th February, that whilst he alluded only to selected, and, as we are led to infer from his last communication, somewhat rare specimens, the mineral alluded to in the article published by us was an analysis of an ordinary specimen, apparently representing the bulk of the vein, which we happened to have in our possession at the time. The examination of that specimen, and the partial analysis by our friend, added to our previous knowledge of it, appeared to fully justify the conclusion that the main portion of the mineral consists, as described in our article of Feb. 9th, of a silico-carbonate, metamorphosed from a sulphurated ore. The specimens which accompanied the letter that we give to-day, do not appear to differ essentially from that on which the above opinion was founded.

One word with reference to the "analysis" which we obtained from our friend. The gentleman who made that examination is now at the East, and cannot answer the call of our correspondent. We knew that he had previously analyzed the mineral carefully—a work for which he is in every way competent; and we requested him to merely make such an examination of the specimen in our possession as to enable him to verify its identity with those which he had previously examined. It was not at all essential to the purpose in view, that such analysis should be complete. If Mr. Arents will send us by mail about half an ounce of the mineral which he calls Partzite, we will promise him a faithful analysis of the same, and an opinion as to whether or not it is a new mineral, from a party every way competent to the determination, and whose name shall accompany the report of the analysis.

**DIFFICULTIES IN CHLORINATION.**—We alluded in our issue of the 30th ult., to some of the difficulties encountered in the chlorination process—particularly to the detrimental action of magnesium and lime, when not chloridized in the furnace. There are many other difficulties met with in this process, which can be properly disposed of only by such as are thoroughly and practically versed in the business. The perfect success of the process depends almost entirely on a correct knowledge of the minerals with which the operator is dealing, and the chemical action to which they are subjected in the reverberatory. A thorough desulphurization is especially important. The loss from the presence of sulphur is not confined merely to the ore with which the sulphur is in direct communication, as many suppose; but the detrimental influence of the sulphur extends to a distance of several diameters of the sulphuret itself, preventing, to a great extent, the chlorine from acting upon even the free gold within that space. Arsenic, phosphorus, antimony, etc., are equally detrimental when not understood; but all of which may be readily treated by an intelligent expert.

We would take occasion to mention in this connection that an eminent engineer recently arrived on this coast, and who has had extensive experience in the chlorination process in other places, would like to make arrangements with any parties having within their reach a sufficient supply of sulphurets to warrant the erection of such works. We understand he has some valuable improvements in the practical manipulation of sulphurets, and in the economy of fuel and labor in that direction. Further information can be had at this office.

**PACIFIC BASE-BALL GUIDE FOR 1867.**—A. Roman & Co., publishers, have sent us a copy of this work. It gives the "rules and regulations" of the game, as amended last year, and duly authorized by the Base-Ball Convention.

## Foundry and Machine Work.

At Messrs. H. J. Booth & Co's UNION IRON WORKS we find that a large amount of important machinery is being turned out at the present time.

## LOCOMOTIVES.

Another magnificent locomotive received its finishing touch on Tuesday, ready for trial. Its weight is about 18 tons, with tenders 32 tons; cylinders 14x18 inches. We cannot look upon these California-made majestic motors without a feeling of pride for our master-mechanics and artisans. Messrs. Booth & Co. have constructed this engine upon a plan peculiarly well adapted to secure great power and speed combined. The whole weight of the locomotive rests upon four drivers. These driving-wheels are of good size, being 4 ft. in diameter, with the axles 6 ft. apart. This gives it an easy turn upon a short curve. The cost of construction is somewhat lessened by this mode, and a light engine is enabled to do the work of one of a heavier grade.

These works are also building a new class of locomotives for freighting on heavy grades. The water-tank is carried over the boiler, approximating in appearance the pack on a mule's back. Cylinders 14x18 inches; 6 drivers 3 ft. in diameter. They are built especially suitable for consuming Mount Diablo coal. The working capacity of these engines is represented by the operation of the Sampson, which has taken 26½ tons, net weight, 6½ miles in 25 minutes, over a grade of 300 ft. to the mile.

The material of these locomotives, we are assured, is entirely of the very best—a significant fact, showing that Messrs. Booth & Co. are determined to establish and maintain an enviable reputation for California locomotive building. The best Swedish iron is used; the boiler plates are manufactured to special order, of charcoal-hammered iron; stay bolts and braces of Ulster iron, etc.

## A number of

## COAL CARS,

Of an original pattern, are to be seen at these works. They are made of plate iron. The dump in the bottom may be opened instantly. It is operated by a device similar to that of a car-brake placed horizontally.

## CAR WHEELS.

The casting of car wheels has been reduced to a degree of perfection which has cost a great amount of study and experimenting at these works. It is gratifying to say that they are now made with a nice precision, which insures both economy and durability.

## MINING MACHINERY.

Last week there was shipped from this Foundry, for the Midas Co. near Virginia City, Montana, a 15-stamp mill, including a 45-horse power engine, 1 large size Blake's crusher, 2 Wheeler & Randall pans, 3 Attwood agitators, 3 Hendy concentrators, 1 No. 3 Excelsior pump, smelting furnace, retorts, etc. Also, another 6-stamp mill for the same company, comprising a 16-horse power engine, 2 Attwood agitators, 1 Hendy concentrator, 1 Wheeler & Randall pan, and 1 settler. All except the engines were manufactured here to order.

Prof. H. A. Ward (a gentleman who owns a private museum in Rochester, N. Y., valued at over \$40,000), is superintendent of the Midas, and seems to have a correct appreciation of California-made machinery. After thoroughly acquainting himself with both Eastern and California-made mining machinery, he insisted upon patronizing our own, notwithstanding the extra expense on the first outlay. The freight on this machinery, about 30 tons in weight, cost 30 cents per pound, against 12½ cents, the cost of freight from St. Louis. The machinery for this company comprises some of the latest and most approved patterns, and will doubtless give good satisfaction, opening up, we hope, a new source of trade for our iron workers; for certain it is, that experience will soon teach our mining neighbors that Prof. Ward has acted with wisdom.

With the 15-stamp mill was constructed a model for the laboratory, including a crusher, pan, settler, etc.

Messrs. Booth & Co. are manufacturing for the CARSON HILL Co., of Calaveras county, a 20-stamp mill, 1 Blake's crusher, 5 Wheeler & Randall Excelsior pans, 5 7-ft. settlers, and several Hendy concentrators, to be accompanied with a 45-horse power engine.

For the ALTURAS M. Co., Yuba district, Idaho, 1 45-horse power engine, 20 stamps, 5 Wheeler & Randall Excelsior pans, 3 7-ft. settlers.

For the BRUNSWICK MILL, near Empire City, Washoe, 2 Wheeler pans, 1 8-ft. settler.

For the ORIENTAL M. Co., Wisconsin Hill, Placer county, 1 large size 4½-ft. Wheeler & Randall Excelsior pan, 1 8-ft. settler.

For the BIG BLUE LEAD Co., Kern county, 4 batteries of 4 stamps each.

For the SENASTOPOL MILL, Grass Valley, 4 of Hendy's concentrators.

STOCKHAM's new rock drilling machine, just completed in full working size, is on exhibition. This drill is forced against the rock by a powerful spiral spring, drawn back by a double cam revolving against a tappet. It is simple, and appears to work with a decided success. Captain Cushing, who has this invention in charge, will soon give us an opportunity to illustrate it.

#### MISCELLANEOUS WORK.

Besides other work on hand at the Union, we may mention 50 new retorts for the S. F. Gas Co., to be placed in the new works on Townsend street; Excelsior pumps (which give excellent satisfaction), for Cushing & Co.; a lot of machinery for the new barrel factory on the Potrero; a piece of ordnance for the California Powder Co., made of iron gun-metal, 24-pounder, bore 5½ inches; and extensive repairs on the heavy machinery of the steamship Orizaba.

We expect to continue our report on work at the foundries from week to week.

**NEW INCORPORATIONS.**—April 8th—Industrial and Immigration Association of California: To promote the settlement of vacant lands, and to attract immigration. Capital stock, \$5,000,000; in five million shares of one dollar each. Trustees: R. Townsend Huddart, J. C. Pelton, Thomas Mooney, James Hunter, James D. Connell, Edward Bosqui, Geo. Fisher, John R. Fishbeck, H. L. Davis, H. A. Cobb, Carl Precht, M. D., P. Edw. Connor, L. P. McCarty, Dr. Pigné-Dupuytren.

#### [Special Notice.]

**STAIR BUILDING**, by means of a due regard to a proper division of labor, has gradually grown greatly to the interest of all concerned—into a distinct and separate branch of architecture, being now ranked among the most beautiful and the most useful of the arts—the rules and principles governing it being as well established and as completely reduced to a science as those of Natural Philosophy. The undersigned established himself in this city, in this branch of business, in the year 1858, since which time he has built not only a very large amount of stairwork, but much of it of a very high order and difficult of execution, which he honestly believes, without any disparagement to others, will bear comparison as to strength, symmetry and fineness of finish, with any similar work executed on the coast. In order that others may form some idea of the amount and value of the work, and satisfy themselves as to its style, they are referred to the stairs of Grace Church, Synagogue Emanuel, Masonic Hall, Lincoln School, Cosmopolitan Hotel, and also to those of the steamer Capitol, and other steamers, all of which have been put up in the time mentioned, upwards of \$50,000 worth of stairwork having been turned out from his establishment in the last three years preceding January 1st, 1867.

In addition to the above, all interested are referred to the stairwork of the Mechanics' Institute, which has just been completed at a cost of \$1,450.

The undersigned is now engaged in building the stairs of the new Mercantile Library building, which will be the finest in the city, if not in the Union, at a cost of \$9,000.

Rails, posts and balusters for the interior, are warranted to fit with neatness and accuracy when orders are accompanied with the size of the stairs or the proper measurements. All orders, whether sent by mail, or left at the subscriber's place of business, No. 49 Beale street, will be promptly and faithfully executed.

N. P. LANGLAND.

San Francisco, April 12, 1867.

## HENDY'S LATEST IMPROVED CONCENTRATORS,

FIG. 1.

FIG. 2.

### FOR GOLD AND SILVER ORES,

With Revolving Stirrers and Rotary Distributor.

Can be seen in Operation at the Union Foundry, First St., San Francisco.

#### Directions for Operating Hendy's Concentrators:

- The sulphurets are drawn off while the Concentrator is in motion, in the following manner:  
**FIRST**—Set the Pan, A, level, by its inner rim.  
**SECOND**—While in operation, keep the Pan, A, about half full of sulphurets. [See Figure 2, marked S.]  
**THIRD**—Open the gate, E, sufficiently to discharge the sulphurets as they accumulate over the amount above mentioned.  
**FOURTH**—The crank shaft to make 200 to 220 revolutions per minute.

#### References:

- Reference is made to the following mills, which have HENDY'S CONCENTRATORS in use:

And in use in many other parts of this coast.

For description, etc., send for Circular.

Those in want of Concentrators would do well to visit some of the quartz mills that have Hendy's Patent Concentrators in use, and satisfy themselves before purchasing other Concentrators of pretended merit.

#### Remarks:

Many Concentrators have been gotten up in this city. Some of these claim foreign origin; others are of home production. The sonorous Greek names, with which some of these have been dignified, ought, it would seem, to have entitled them to a better fate than that which has befallen them. A large proportion of these machines are now "numbered among the things that were." A few were still-born; never having had an existence except in the shape of advertisements and cuts, prematurely prepared by their too confident projectors. For one of these it was claimed, with a grand flourish of trumpets, that it had no "tilting-traps or other gimcracks, to be ever out of order or in the way." Unfortunately, however, although it had a reasonable supply of legs, it obstinately refused to run. Amputation failed to remedy the defect, and it now lies forgotten among a heap of old iron,—a mechanical abortion.

For further particulars, read article on Concentrators in the Circular of the Union Iron Works, for 1866, pages 51, 53.

#### CAUTION.

All of HENDY'S PATENT CONCENTRATORS are marked thus:

"J. HENDY, Patented February 27th and April 17th, 1866."

Orders or letters of enquiry, address,

JOSHUA HENDY, Patentee,  
Union or Fulton Foundry, San Francisco.

March, 1867.

HAMMERED IRON

Of every description and size.

Orders addressed to PACIFIC ROLLING MILL and FORGE CO., Post Office, San Francisco, Cal., will receive prompt attention.

The highest price paid for Scrap Iron. 9v143m9p

A. S. Hallidie & Co.,

MANUFACTURERS OF

FLAT & ROUND WIRE ROPE,

For Mining, Shipping, Ferry,

AND GENERAL PURPOSES.

Office—412 Clay street. Works—North Beach

**NOTICE.**—THE FIRST COST OF WIRE ROPE IS MUCH less than that of any other kind of Rope of equal strength, and it is four times as durable. Wire Rope does not stretch or shrink by atmospheric changes; it has but one-fifth the bulk of Hempen Rope; is spliced and repaired in the same manner.

The attention of Mining Companies is particularly called to our Flat and Round Hoisting Ropes, which have been in use for a number of years by the leading mines on this Coast, and many of whom we refer those interested as to the great advantages over any other kind of rope; effecting an immense saving in expenditure for ropes, fuel, wear and tear of machinery, stoppage of works, etc., besides increasing safety of life.

Mining Companies, in erecting Hoisting Works, should be sure and have their drums and pulleys of sufficient size, whether for wire or hempen rope.

We manufacture of all sizes, and in any length—

Round Wire Rope—Iron or Steel, for Hoisting.

Flat Wire Rope—

Soft Steel Wire Rope—For Derrick Fall Ropes—very strong and durable—one third the weight of hempen of equal strength, (saving in freight for remote localities). Suitable sheaves and blocks furnished when required.

Galvanized or Ungalvanized Round Wire Rope—For Ships' Rigging, Derrick Guys, Ferry Ropes, and all standing purposes.

Steel Ferry Ropes—For wide streams. Ferry Blocks supplied.

Iron and Copper Wire Cord—½ to ¾-inch diameter, for hanging window sashes; Signal Cord; Sash Pulleys on hand.

Comparative Weight, Size and Strength of Iron Wire Rope, Steel Wire Rope, Hempen Rope, and Chain.

Iron Wire Rope.	Steel Wire Rope.	Hemp Rope.	Chain.	Equivalent Strength.

#### Boy Wanted.

About fifteen or sixteen years of age, for errand and mailing clerk. Must write a good hand, and come well recommended. Address or apply at this office.

Established in 1849--Corner First and Mission streets, San Francisco.

HAVING INCREASED OUR FACILITIES IN EVERY DEPARTMENT, WE ARE NOW prepared at the shortest notice and at the most reasonable rates, to furnish all kinds and description of Machinery, including Steam Engines, Quartz Mills, Mining Pumps of all kinds, Hoisting Gear, Gas Work, Laundry Machinery, Architectural and Ornamental Castings, Sugar Mills, Saw and Flour Mills, Water Wheels of all kinds, Hydraulic, Hay, Rag, screw and Drop Presses, Coining Machinery, Pipe Drivers, Bark and Malt Mills, and all kinds of Castings.

**ENGINES.**—Marine Engines, Oscillating and Beam; Stern and Side Wheel Boats, Locomotives, Stationary Engines, Horizontal, Upright, Oscillating and Beam, from six to fifty inches diameter. Also, Scott & Eckart's Adjustable Out-off Regulator—best in use; W. R. Eckart's Balance Valve for Stationary Engines; Woodward's Patent Steam Pump and Fire Engine.

**BOILERS.**—Locomotive, Flat, Tubular, Upright, Cylinder and Cornish, and every variety of Boiler Work. All sizes of tubes and pipes for pumps.

**PUMPS.**—The Excelsior double-acting Force Pumps are manufactured by us. These very superior Pumps are warranted the best, and are fast replacing all other Force Pumps.

**AMALGAMATING MACHINERY.**—Wheeler & Randall's Improved Tractory Curve Pan, Zenos Wheeler's Improved flat bottom pan, Beldin's pan, Vetch's tuba, Prater's concentrators, Waklee's pans, Beers' pan, Oerman Barrels, Anstra Gearing, Chile Mills, Settlers of all descriptions, Retorts of all sizes and shapes, for Silver and Gold, Portable Stamp Mills, Straight Batteries, for wood or iron frames, Dry Crushing Batteries, or machinings with the latest improvements, every variety of Stamps, Mortars, Gams, Fans and Tubs. **BLAKE'S PATENT QUARTZ CRUSHERS**, of all sizes.

**OIL BORING TOOLS AND MACHINERY.**—Of the latest and most approved construction, made from drawings lately made by Prof. Blake at the oil wells in Pennsylvania. We have the facilities for working gold and silver quartz and other ores, to test their value, by the hundred weight or ton.

Russia Iron Screens, of all degrees of fineness and of all qualities of iron. All work done in the best manner at the lowest cash prices.

All kinds of Sheet Iron and Water Pipe, Coal Oil Stills, Wrought Iron Worms, etc., etc. Manufactured to Order.

**Old Boilers Repaired**  
**D. CAMERON.**

**WASHING RICH ORES BY HAND.**—The Reese River *Reveille* of March 23d, has the following: From information derived from several sources we are led to believe that mining for chloride ores will be quite general in this district during the coming season. There are a number of claims on Lander Hill that yield ore of a high grade. These have been worked more or less lately, and their chloride ore has yielded silver at the rate of from \$250 to \$400 per ton. We gave an account a few days ago of six large bars of bullion which were produced at the Keystone mill from several small lots of chloride ore which were obtained from claims on Lander and neighboring hills. We have been told of a case where three men had mined for a year steadily in Lander Hill, and had extracted chloride ore to the value of \$9,000. One who is at all familiar with the history of the mines of that hill, and with the extraordinary ore that is frequently met with, will not find the story difficult to believe. In a claim showing occasional bunches of rich chloride ore, it is not a hard matter for a couple of experienced miners, who can assort the ore skillfully and closely, to bag a thousand dollars or so as a reward for a few months' work. Of course we do not pretend to say that this is the general experience. We admit it is the exception to the rule. All that we claim is, that of the 6,000 or 7,000 locations in the district—a considerable proportion of which were located without reference to their merits, and conveyed to "middle-men" in the Eastern market—there are several hundred good veins, many of which will produce rich chloride ore. Such a mine may be worked by a couple of men as easily and far more profitably than an ordinary placer mine. We are personally acquainted with an intelligent miner, who has one partner working a mine on Lander Hill, and who is critically assorting the ore taken out in the expectation of collecting a ton that will yield \$5,000 or \$6,000. Would not such a result be well worth a year's labor? It is certainly worth the trial.

**TOWNE & BACON,**

THIS OLD ESTABLISHED HOUSE is in PERFECT order for the accommodation of guests. Persons seeking comfort and economy will find this the best Hotel in the city to stop at. The Beds are new and in good order, and the Rooms well ventilated. The Table will always be supplied with the best in the market.

Prices varying from \$1.50 to \$2 per day for Board and Room.  
FINE BATH HOUSE and BARBER SHOP ATTACHED TO THE HOUSE.

Boats belonging to the House will be in attendance at all the boats and cars to convey passengers to the House FREE OF CHARGE, and to any part of the city for 50 cents.  
2v12 P. E. WEGANT, Proprietor.

**THE PACIFIC IRON WORKS,**  
First & Fremont Sts., between Mission & Howard, San Francisco.

The proprietors of the above Works invite the attention of all parties interested to their greatly improved and unequalled facilities for manufacturing Steam Engines and Boilers, both Marine and Stationary, of any required size and pattern, Quartz Mills, Amalgamating, Pumping and Hoisting Machinery of the most approved construction. Flour, Saw, and Sugar Mills, Water Wheels, &c. &c. Our pattern list is most complete and extensive, embracing the late improvements in all classes of machinery adapted to use on this coast. We would call especial attention to the fact that we have secured the exclusive right of manufacture for the Pacific Coast of the celebrated Greene Engine, conceded to be the most economical and perfect working Engine now in use. We are also exclusive manufacturers of the celebrated

Bryan Battery, Varney's Amalgamators and Separators, Ryerson's Superheated Steam Amalgamators and Rotary Crushers, Stone Breakers, &c. Orders respectfully Solicited.  
**GODDARD & COMPANY.**

**PIONEER IRON SHUTTER WORKS!**

## Golden City Chemical Works.

LABORATORY,  
Corner of Seventh and Townsend Streets.  
OFFICE,  
Corner of Montgomery and Bush Streets.

CAPITAL STOCK, --- \$500,000

### Trustees:

H. P. WAKELEE, THOS. H. SELBY,  
NICHOLAS LUNING, THOS. BELL,  
CHAS. E. McLANE.

H. P. WAKELEE.....MANAGER.

THIS COMPANY ARE NOW PREPARED TO FURNISH  
Sulphuric, Nitric and Muriatic Acids of superior quality,  
in quantities to suit.

Orders will be received at the office only for Chemicals of  
every description, which will be manufactured as may be  
required. The Company beg to say that they have the ad-  
vantages of all improved machinery and apparatus for the  
manufacture and manipulation of these products, and our  
Laboratory is fitted up with the most recent improvements  
which experience and science suggest, and is surpassed by  
none in completeness and perfection for the purposes it is  
designed. 9v143m

## Overland Route.

### THE PENINSULAR AND ORIENTAL

STEAM NAVIGATION COMPANY'S

#### STEAMSHIPS

Leave Hongkong Twice a Month,

(On the 1st and 15th in the Northeast Monsoon,  
and about the 11th and 29th in the  
Southwest Monsoon.)

—FOR—

SOUTHAMPTON AND MARSEILLES,  
VIA EGYPT,

Calling at Singapore, Penang,  
Point de Galle, Aden, Suez, Alex-  
andria, Malta and Gibraltar.

From Point de Galle their steamers run to Madras,  
Calcutta, and Bombay, twice a month, and once a month  
to King George's Sound, Melbourne and Sydney.

From Hongkong their steamers run constantly to  
Swatow, Amoy, Foochow, Shanghai, and Yokohama.  
HONGKONG, 1867. 13v14tf

STANDARD SOAP COMPANY'S  
WASHING POWDER.

THIS POWDER IS SUPERIOR TO ALL OTHER PRE-  
parations for washing and cleansing. It is made of pure  
material and contains nothing that will injure the finest  
fabric. Equally as good for using in hard as soft water.  
One pound will make three gallons of beautiful soft soap.  
Put up in wrappers of 1-lb each, and in wooden boxes of  
16-lb bulk. Ask your grocer for a package, and test its  
virtue. Manufactured at 304 Sacramento street  
San Francisco. 13v12q

## Metallurgy.

### Pacific Chemical Works.

#### FALKENAU & HANKS,

Desire to call the attention of Druggists, Manufacturers,  
Metallurgists, Millmen, Assayers, Chemists and  
Students, to their

#### ANALYTICAL LABORATORY,

And Establishment for the manufacture of Pure Re-agents,  
Pharmaceutical Preparations,  
And all CHEMICALS used in the Arts. They are prepared  
to make Chemical investigations,  
Analyses and Assays,  
Of every description, and to give advice upon all matters  
pertaining to Technical Chemistry.

Office, 629 Washington street; Laboratory, Corner of  
3v14-tf Center and Polson streets.

## EUROPEAN METALLURGICAL WORKS,

—AND—  
Practical Mining School,  
Bryant Street, Between Third and Fourth,  
SAN FRANCISCO.

### THE PROPRIETORS ARE AT ALL TIMES PREPARED TO WORK OR TEST

Ores sent to this establishment—either in large or small  
quantities—by such process as may be found best adapted to  
their chemical character, after a careful analysis has been  
made. Test lots of Ore adapted to the smelting process at-  
tended to. Sulphuric, pyrites, and the (so-called) "rebel-  
lous ores," are having especial attention paid to their suc-  
cessful treatment. Assaying in the humid and dry way.  
Also, refining by cupellation, done at moderate rates.

#### PRACTICAL MINING SCHOOL.

The proprietors—encouraged by numerous applications  
from gentlemen desirous of pursuing the study of practical  
metallurgy—have concluded to admit parties on reasonable  
terms. Having in their Mill all the necessary ap-  
paratus for crushing, roasting, amalgamating, smelting,  
refining and assaying, as also a well extended Laboratory for  
the analysis of Ores and Minerals, a good opportunity is  
here offered to acquire a sound practical knowledge of the  
business.

S. P. KIMBALL,

J. R. MURPHY,  
10v10

### MOSHEIMER'S Metallurgic Works

And Practical School for Assaying  
and Metallurgy.

THE UNDERSIGNED HAS REOPENED METALLUR-  
gic Works, and is prepared to reduce any kind of Ores,  
by Smelting, Amalgamating, or other processes, that the  
nature of the ore may require.

Practical Instructions given in Assaying, all branches of  
Metallurgy and Technology.  
Furnishes Plans and Estimates for the erection of Quartz  
Mills, Smelting and other Reduction Works.

Having carefully studied the science of Concentrating  
Ores, I can offer better concentrating machinery than any  
in use in California, and especially such as will save the  
fine or floating gold and sulphurets.

TO VICTIMS OF RHEUMATISM IN  
ALL ITS FORMS.

BE IT KNOWN TO ALL WHO ARE AFFLICTED WITH  
this terrible and excruciating disease, that the means  
of a safe, speedy and permanent cure are within the reach  
of every sufferer, by using

RICHARDS' REMEDY!  
For Inflammatory, Chronic, Hereditary and Mercurial  
Rheumatism, Rheumatic Gout, Lumbago, Sciatica, and all  
the modifications of the disease, whether confined to one  
portion of system or erratic in its character. Composed  
wholly of VEGETABLE EXTRACTS, it exterminates the  
cause of the disease, and restores the system to its normal  
condition. It is the result of many years' ob-  
servation and experience. The reputation of mere palli-  
atives soon dies out, but that of a STEELING MEDICINE,  
which produces, year after year, in all cases, the same ben-  
eficial effects, NEVER DIES. This has been the history of  
Richards' Remedy. Try it!

For full particulars, send for a copy of the "Richards' Remedy"  
to H. BOWMAN, Druggist, Sacramento,  
11v15 And by Druggists generally.

Proprietors.

## List of Officers of Corporations and Mining Companies.

(PUBLISHED IN THE FIRST ISSUE OF EACH MONTH)

(Below we give the date of recent meetings held in this city, and the names of officers chosen or appointed. Every bona-fide company is invited to send us the result of their election, to be thus put on record, gratuitously, with any other facts of general interest.)

**CALIFORNIA BORAX Co.**—March 13th. Trustees: L. Maynard, C. J. Brenham, E. B. Northrup, S. F. Butterworth, A. C. Peachy. President, L. Maynard; Secretary, J. W. Mather; Superintendent, C. W. Lightner.

**EUREKA COAL M. Co.**—March 4th: Trustees: Geo. Platt, Jos. S. Kohn, W. Burling, L. H. Newton. President, W. Burling; Treasurer, L. H. Newton.

**NUESTRA SENORA DE GUADALUPE Co.** March 4th. Trustees: F. Staud, John Greif, A. Himmelmann, M. Kirsch, E. J. Pfeiffer. President, F. Staud; Secretary, E. J. Pfeiffer; Treasurer, A. Himmelmann; Superintendent, J. J. Correll.

**SAN MARCIAL S. M. Co.**—State of Sonora, Mexico.—March 19th. Trustees: Henry Brickwedel, Isaac Branham, P. J. White. President, Henry Brickwedel; Secretary, R. N. Van Brunt; Superintendent, F. A. Prescott.

**WATT CONS. G. & S. M. Co.**—March 13th: Trustees: Wm. N. Shelly, Andrew Young, H. W. Jones, H. Bailey, John F. Schander. Secretary, Geo. R. Furburt.

## National Mineral Land Law, Instructions. Blanks, Etc.

Copies of the Act of Congress, approved July 26th, 1866, relating to the Location of Mineral Lands, together with the instructions to the "United States Registers and Receivers and Surveyors General," from the Commissioner of the General Land Office Department of the Interior, dated at Washington, Jan. 14th, 1867, can be had at this office. Also a full set of blanks for making applications, advertising, etc. Address Dewey & Co., office Mining and Scientific Press, San Francisco.

## Perry Davis' Vegetable Pain Killer.

As an internal remedy, has no equal. In cases of Cholera, Summer Complaint, Dyspepsia, Dysentery, Asthma, it cures in one night, by taking it internally, and bathing with it freely. It is the best liniment in America. Its action is like magic, when externally applied to bad sores, burns, scalds and sprains. For the sick headache and toothache, don't fail to try it. In short, it is a Pain Killer.

**PERRY DAVIS' PAIN KILLER.**—This medicine has become an article of commerce, a thing no medicine ever became before. Pain Killer is as much an item in every home of goods sent to country merchants as tea, coffee, or sugar. This speaks volumes in its favor.—*Glen Falls Messenger.*

Sold by all Medicine Dealers everywhere. 14v14-1m

## Allen's Lung Balm.

The following letter, from Dr. A. L. Scoville, who has had many years experience in the medical business, and with Lung Remedies, will give the added still more assurance that the sure remedy is found at last; and the consumptive should lose no time in commencing the use of Allen's Lung Balm:

CINCINNATI, JUNE 9, 1864.  
Gentle—I make the following statement from a perfect conviction and knowledge of the benefits of Allen's Lung Balm, in curing the most deep-seated Pulmonary Consumption. I have witnessed its effects on the young and the old, and I can truly say that it is by far the best expectorant remedy with which I am acquainted. For Coughs, and all the early stages of Lung Complaints, I believe it to be a certain cure, and if every family would keep it by them, ready to administer upon the first appearance of disease about the lungs, there would be very few cases of fatal consumption! It causes the phlegm and matter to raise without irritating those delicate organs (the lungs) and without producing constipation of the bowels. It also gives strength to the system, stops the night-sweats, and changes all the morbid secretions to a healthy state.

Yours, respectfully,  
A. L. SCOVILLE.  
Consumptives, do not despair, because all the remedies that you have tried have failed, but try this Great Remedy. Be sure you call for Allen's Lung Balm. Price One Dollar per bottle.

Sold by all Medicine Dealers everywhere. 14v14-1m

## New Mining Advertisements.

## Adella Gold Mining Company, Rock Creek, Sierra County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the ninth day of April, 1867, an assessment of fifty (50) cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, A. C. TAYLOR, No. 429 Pacific street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the ninth day of May, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twenty-seventh day of May, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

Office, No. 429 Pacific street, San Francisco. apr13

## Batopilas Mining Company, Batopilas District, State of Chihuahua, Mexico.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the eleventh day of April, 1867, an assessment (No. 3) of two (\$2) dollars per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, No. 811 Montgomery street, up stairs, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the sixteenth day of May, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the third day of June, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

A. MARTINON, Secretary.  
Office, 811 Montgomery street, up stairs, San Francisco, Cal. apr13

## Santa Cruz Petroleum Oil Works Company.

Location: Santa Cruz County, California.

Notice—There are delinquent, upon the following described stock, on account of assessment (No. 19) levied on the ninth day of March, 1867, the several amounts set opposite the names of the respective shareholders as follows:

Names.	No. Certificate.	No. Shares.	Amount.
Coulter, Jas.	218	5	\$2 50
Christiansen, C.	682	50	25 00
Christiansen, C.	681	50	25 00
Hahn, John.	686	50	25 00
Jones, Martha.	680	50	25 00
Mathiesen, Pauline.	686	4	2 00

## San Marcial Silver Mining Company, Location of Works: San Marcial, District of Hermosillo, State of Sonora, Mexico.

Notice—There are delinquent, upon the following described stock on account of assessment levied on the thirtieth day of January, 1867, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.
--------	------------------	-------------

**SILVER BEND.**—The Reporter, which salutes us from the new town of Belmont, March 30th, says: We are in the midst of a mining region, the wealth of which the world cannot yet comprehend. In extent it is greater than many of the States of the East, or than many of the kingdoms of Europe. The Transylvanian ledges have now been sufficiently opened to exhibit a mineral belt of about a mile in length, of an average width of 12 ft., and of an average yield of not less than \$100 per ton. The quartz is pay rock from the top, and is being worked from the surface. If appearances are not utterly deceptive, the ledges referred to are as much better defined, richer, more permanent and valuable than the Comstock, as the Comstock is better than no ledge at all. This may sound like the language of extravagance, but time will demonstrate it to be the simple truth. Col. Buell's mill has extracted \$100,000 of bullion from 1,000 tons of Highbridge ore, all taken from within 25 ft. of the surface, and there are 80 stamps on the road for the Combination and Child & Canfield Co's, which will make our bullion yield something over \$200,000 per month before the summer is over.

A week or two since a ledge was discovered near the entrance to Charnock's Pass, upon the foothills immediately adjoining the Smoky Valley, that bids fair to prove of no little importance. Mr. Charnock is the discoverer. There are several owners. Workmen are sinking upon the vein. Its thickness at the depth at present attained is six ft., and it is represented to carry mineral throughout its entire width.

In Turkey, the income of the sovereign absorbs ten and eight-tenths per cent. of the entire revenue. In England six-tenths per cent. are applied for supporting royalty.

**QUICKSILVER.**—A promising discovery of cinnabar has been recently made in Pope Valley, Napa county.

## Gaston's Screw Grinder and Amalgamator

The Best Yet Invented.

For rapidity and thor-  
oughness of work, the ma-  
chine above illustrated is  
unequaled by any. It  
wastes no appreciable  
quantity of quicksilver,  
and is of itself a perfect  
settler. Fig. 1 represents  
the pan with part of its  
side removed, and fig. 2  
the screw muller, and its  
shoes. The letters C show  
the threads of the screw;  
H, its shoes, and D a low  
cylinder within which the  
screw rotates; E, repre-  
sents open spaces through  
the base of the cylinder,  
and F, inclined partitions  
filling (at those points) the  
spaces between the cylin-  
der and the shell of the  
pan. These inclined par-  
titions are to intercept the  
current of pulp around the  
pan, as it issues from un-  
der the muller, and turn it  
toward the center again, over the screw. The dies are not shown in the  
figure—there are eight. Mercury is not ground, nor floured in this pan. The pulp is ground to a  
slum, with great rapidity; the muller is raised a little and the quicksilver is poured in *en masse*, form-  
ing a layer upon the bottom of the pan. The revolution of the screw then forces the pulp down into  
contact with the quicksilver, into which it is *effectually rubbed* by the shoes, while the screw, being  
constantly fed by the pulp from above it, presses all under the muller outward—still in contact with the  
quicksilver, through the spaces, E, and thence over toward the center of the pan, when it is again  
seized by the screw and forced down into the quicksilver, rubbed into and forced off in contact with it,  
which process is continued as long as desired. The pulp can thus be forced into contact with the  
mercury at the rate of 1,000 pounds in three minutes, or twenty times per hour, and none can escape  
contact with the mercury, that contact being under the immense pressure of the perpetual screw, in  
addition to that of gravity, which (gravity) is the only available force in the other pans for bringing the  
pulp into contact with the quicksilver. "A word to the wise is sufficient." The Screw Amalgamator  
is the cheapest and most efficient pan manufactured. Millmen! call and see one running at the Pacific  
Foundry. For particulars, address the inventor, H. A. GASTON, at Cosmopolitan Hotel, San  
Francisco; or R. L. THOMAS, Esq., Virginia City, Nevada. 1v14 4r

Mining and Scientific Press Office.

## FOR SALE!

**PATENT RIGHT OF**  
HUNT'S WINDMILL for the  
State of California or the whole  
Pacific coast.  
This Mill is superior to any  
other, can be built cheaper, and  
is more durable.  
Full sets of patterns for four  
sizes Self-Regulating Mills, and  
three sizes of Adjustable Mills,  
will be sold with the right.  
This Windmill has been exten-  
sively advertised all over this  
coast, and is favorably known.  
Apply to  
**E. O. HUNT,**  
28 SECOND STREET,  
11v24 San Francisco.

## Nitro-Glycerin!

WE ARE INFORMED THAT CERTAIN PERSONS ARE  
offering to manufacture and sell Nitro-Glycerin, to be  
used for Explosions in Oil Wells, Blasting or other pur-  
poses.

This is to notify the public that the United States Blasting Oil  
Company is the sole owner of the Nobel Patents for manufacturing  
Nitro Glycerin, and for exploding the same; and that any and all  
infringements of the Company's rights will be prosecuted in law.

The Company is now prepared to supply any desired  
quantity of the best quality of Nitro-Glycerin to the public,  
with instructions how to use it and avoid accidents. Orders  
to be addressed to JAMES DEVEAU, Secretary, 32 Pine  
street, New York.

**T. P. SHAFFNER,**  
President U. S. Blasting Oil Company.  
32 Pine street, New York.

**V. CUSHING, Agent**  
For the Purchase and Shipping of Machinery  
OF ALL KINDS.

**SPECIAL ATTENTION GIVEN TO QUARTZ MILL**  
Machinery and Findings, and Miners' Material of every  
description. Being a PRACTICAL MACHINIST, and giving  
my personal attention to the execution of orders, I can  
guarantee the BEST class of work at the LOWEST PRICE  
in the city. Office, No. 120 Front street, San Francisco.  
3v11r

**Important to Californians.**—Many inventors have  
lately had their claims for Patents seriously (and in some  
cases fatally) delayed by the unqualification of agents who  
have not complied with the Government license and revenue  
laws, as well as other new and imperative regulations.  
These discrepancies, although arising from the inexperience  
of honest agents, are none the less dangerous to applicants  
for patents, whose safest course is to trust their business  
with none but active and experienced solicitors. THE MIN-  
ING AND SCIENTIFIC PRESS PATENT AGENCY has strictly com-  
plied with the requisitions of the Department, and properly  
filed all necessary papers as Olaim Agents.

## Portable Steam Engines!

"Hoadley's" and "Hittinger's" Make.

**HOADLEY'S.**  
**FOUR SIZES,**  
8, 10, 12, and 15-Horse Power,

**HOADLEY'S.**  
**3 to 40-Horse Power.**

**HITTINGER'S.**  
**THREE SIZES,**  
5, 7, and 10-Horse Power

**HITTINGER'S.**  
**TWO SIZES,**  
5 and 7-Horse Power,

COMBINING THE MAXIMUM OF EFFICIENCY, DUR-  
ability, and Economy, with the Minimum of weight  
and price.

These Engines are favorably known, a large number  
being in use on this coast for hoisting, pumping, threshing,  
milling and millinery purposes.  
Steam can be got up on these Engines in fifteen minutes  
after reaching the place of operation, and the time, expense  
of setting boilers, machinery, and "construction account"  
saved, (which is often the difference between the successful  
and unsuccessful prosecution of mining enterprises), in  
fact, the portable principle is the pioneer's friend, and en-  
ables him to draw engines on their own wheels to his cabi-  
door, and plant on the outermost confines of civilization  
the saw and grist mill, and it has done and will do more  
to help subdue the continent than any other of the modern  
motors which are crowding society and normalizing the  
world.

All sizes on hand from 3 to 30 horse power, with and  
without carriages.  
Also, Portable Saw and Grist Mills.

For sale by  
**TREADWELL & CO.,**  
9v14-6m1p Corner of Front Market and streets.

## New Patents and Inventions.

Under this heading we shall mention, from week to week as occasion may demand, New and Important Inventions; also, the List of Patent Claims recently issued from the U. S. Patent Office to inventors on the Pacific Coast, and other Patent issues which we deem of local interest to readers on this side of the Continent. Most Patents on this coast are secured through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We are prepared to obtain from Washington, with despatch, copies of any Patent issued.

## RECENT INVENTIONS.

**SOPER'S IMPROVED HAY KNIFE.**—Mr. P. O. Soper, of this city, has submitted to our inspection an improved hay knife, recently invented by him, which presents decided advantages in form of construction over those in ordinary use. This knife is so constructed by the peculiar manner in which it is attached to the handle, that it cuts its way through the hay naturally, and under a comparatively light pressure; allowing nearly the entire strength of the operator to be expended in simply giving the knife its cutting action. Negotiations are being made for the manufacture of a limited number of these knives for this market. This may be set down as another of the really useful and conveniently practical California inventions.

**A NEW PRINTING MACHINE.**—Mark Twain, in a recent letter to the *Alta*, speaks of a new printing machine, owned in part by a Californian, which is creating some attention in New York. According to this correspondent, the invention is such that with a single alphabet of type, arranged around a wheel, the most elaborate book may be impressed letter after letter, in plaster plates, ready for the reception of the melted metal, and do it faster than a printer could compose the matter. It works with a treadle and a bank of keys, like a melodeon. It does away with cases of type, setting up and distributing, and all the endless paraphernalia of a printing office. It will either print or stereotype music with the utmost accuracy. An elaborate "border" may be printed in three minutes, by repeated impressions of a single type.

**Gold Bars**, of whatever size, if well cast, assayed for two dollars, at A. P. MOLITOR'S Assay Office, 611 Commercial street, opposite United States Branch Mint. 15v14-3m

**Stebbins' Grinder, Amalgamator and Concentrator**, combined and all within the same pan, can now be seen in operation at the Franklin Foundry, Fremont street, between Mission and Howard. Sulphurets perfectly concentrated within thirty minutes on the rim off he pan near the surface of the water—the process of grinding and amalgamating going on at the same time. All the inventor asks is an examination of his new Concentrator, believing it to be the best and quickest ever yet invented. 14v14 tf

## Excelsior Double-Acting Suction and Force Pump.

The Best for Mining, Farming and Domestic Use.

Hooper's Patent, Aug. 15, 1865.

THE EXCELSIOR PUMP is a California invention of intrinsic merit, and as such is being rapidly introduced, and giving perfect satisfaction. At the Mechanics' Institute Fair (1865), it was awarded, for its superiority, a **Premium Medal.**

It is manufactured by California Mechanics, in the most perfect and durable manner. It is remarkably simple in construction, and its valve chest is almost instantly accessible without disconnecting the air-chamber, suction or discharge-pipes. It can be worked at any speed.

Figure 1 is a sectional view of a 6-inch Mining Pump, showing the plunger and hemph-packing, and the valve-chest containing the puppet valves. Fig. 2 illustrates the water-passages and valve seats in the chest.

The following sizes are constantly manufactured of this

## SUPERIOR DEEP-WELL PUMP.

No. 1—Cylinder 2½ inches; stroke, 6 inches; capacity 750 gallons per hour; weight, 80 pounds.

No. 2—Cylinder, 3 inches; stroke, 7 inches; capacity 1,280 gallons per hour; weight, 80 pounds.

No. 3—Cylinder, 4 inches; stroke, 9 and 8 inches; capacity, 2,500 gallons per hour; weight, 200 pounds; with iron frame and slide complete.

No. 4—Cylinder, 5 inches; stroke, 15 inches; capacity 5,420 gallons per hour; weight 500 pounds.

No. 5—Cylinder, 8 inches; stroke, 24 inches; capacity 12,575 gallons per hour; weight, 1,000 pounds.

Nos. 3, 4 and 5 are

made to endure the severe test of use in mines, and are constantly superseding those of other manufacturers. The pistons being packed with hemp, are proved to be far more durable and less expensive than leather.

We manufacture to order 8 and 10-inch Pumps. Also, sell at cheap rates, 5 and 6-inch Brass Pumps for ships.

See illustration of the Valve of this Pump, and further description, in another part of this paper.

For Circulars, or further particulars, inquire of or address J. W. BRITTON & CO., Agents, 120 Front street, San Francisco; H. J. BOOTH & CO., Union Iron Works, First street, or lam18

CUSHING & CO., Prop'rs, San Francisco.

## BAKER &amp; HAMILTON,

IMPORTERS AND DEALERS IN

**Agricultural Implements, Portable Steam Engines, Hardware,**

**Rubber and Leather Belting, Etc., Etc.**

Nos. 17 and 19 Front street, San Francisco, and 9, 11, 13 and 15 J street, Sacramento.

**Wood & Mann's Portable Steam Engines, 6, 8, 10, 12 and 15 horse power,**

With newly invented Water Bottom, which entirely surrounds the fire, grate and ash-pit, forming underneath the ash-pit, as up the sides of the furnace, a three or four inch water space, by which additional heating surface is obtained, the accumulation of sediment around the fire-box or furnace is entirely prevented, and renders it perfectly safe to use near any barn, or in any farm yard, or in any building where a stove would be allowed, as no sparks can possibly escape from the furnace or ash-pit. The sediment has a free passage to the bottom of the fire box, and can be blown off daily by the blow-off cock underneath the ash-pit, by which means the Boilers may be kept clean much longer than under the old system. The great saving in repairs which is effected by the use of these water bottoms, and the constantly increasing demand for them, prove their superiority to any others yet constructed.

## HOADLEY'S THRASHING ENGINES.

**HITTINGER & RAWSON'S IMPROVED HOISTING ENGINES, 6, 8, 12 & 20-horse power.**

FOR SALE BY

**BAKER & HAMILTON,**

For Mining purposes, Iron Steam Pipe furnished with Fittings, &c. Coupling Joints of all sizes. Particular attention paid to Distillery Work. Manufacturer of "Garratt's Patent Improved Journal Metal."

Highest Market price paid for OLD BELLS, COPPER AND BRASS. 6tf

## Foundry for Sale.

A One-half Interest in the

**UNION IRON WORKS,**  
SACRAMENTO,

Owned by William R. Williams, is offered for sale on the most favorable terms.

## A Good Bargain

May be had, as the proprietor is going home to Europe. It is seldom that so good an opportunity is offered for a sure and permanent investment. The business of the establishment is exceedingly flourishing, as can be shown. The Shop is of brick, new and well built. The lot is 35 feet front by 163 feet in depth, in a good location for this business, on Front street, between N and O streets.

Inquire at the office of the Foundry, or address

WILLIAM R. WILLIAMS,

Sacramento, Cal.

**Pacific Mail Steamship Co's**  
STEAMSHIPS FOR

**NEW YORK, JAPAN AND CHINA.**

LEAVE FOLSOM STREET WHARF, AT 11 o'clock A. M. of the following dates, for PANAMA, connecting via Panama Railroad, with one of the Company's splendid steamers from ASPINWALL for NEW YORK.

On the 10th, 18th and 30th of each month that has 31 days.

On the 10th, 19th and 30th of each month that has 30 days.

When the 10th, 19th and 30th fall on Sunday, they will leave on Saturday preceding; when the 18th falls on Sunday, they will leave on Monday following.

Steamer leaving San Francisco on the 10th touches at Manzanillo. All touch at Acapulco.

Departures of 15th or 19th connect with French Transatlantic Co.'s steamer for St. Nazaire, and English steamer for South America.

Departure of 10th connects with English steamer for Southampton and South America, and P. R. Co's steamer for Central America.

The following Steamships will be dispatched on dates as given below:

April 10th—MONTANA.....Capt. Jos. Sutton, Connecting with HENRY CHANCEY, Capt. Gray.

April 18th—SACRAMENTO.....Capt. J. M. Cawley, Connecting with OCEAN QUEEN, Capt. Harris.

April 30th—CONSTITUTION.....Capt. W. F. Lapidge, Connecting with the RISING STAR, Capt. Maury.

Cabin passengers berthed through. Baggage checked through—100 pounds allowed each adult.

An experienced Surgeon on board. Medicine and attendance free.

These steamers will positively sail at 11 o'clock. Passengers are requested to have their baggage on board before 10 o'clock.

Through Tickets for Liverpool by the Cunard, Inman and National Steamship Lines, can be obtained at the office of the P. M. S. Co., San Francisco.

For Merchandise and Freight for New York and way ports, apply to Messrs. WELLS, FARGO & CO.

For passage and all other information, apply at the Pacific Mail Steamship Co's office, corner of Sacramento and Leidesdorff streets.

OLIVER ELDRIDGE, Agent.

## Stockham's Rock-Drilling Machine.

We annex hereto an illustration of a hand-drilling machine, for which application has been made for letters patent through this office. It is designed to be operated by two persons, by turning a crank, the drill being forced against the rock by means of a steel spring. The object is attained by constructing a double frame, or any convenient mechanism, by which a universal joint is obtained so as to allow the drill to be pointed in any direction. The drill-stock is extended longitudinally across the frame, A, and has a tappet, J, fixed to the back part of it, behind which is a spring, B, sufficiently stiff to force the drill forward and give the desired blow as soon as the tappet is released by the cam, D. The cam-shaft crosses the frame transversely, and is operated by the crank shown in the illustration. The drill

## California Academy of Natural Sciences.

REGULAR MEETING.

MONDAY, April 15, 1867.

Vice-President Ransom in the Chair.  
Thirty-three members present.  
Messrs. Philip Prior, William Patton, M. J. McDonald, Benj. Smith, and H. Greenwood were proposed for resident membership, and C. L. Anderson, M. D. of Santa Cruz, for corresponding membership. Action on nominations made at last meeting was postponed two weeks.

The collections made by different members during the recent visit to Angel Island, were exhibited and commented upon.

Dr. Kellogg exhibited specimens of the famous intoxicating root of the Sandwich Islands—the Kawoondoo of the natives; the Piper methysticum of the botanists.

Kawine, the acrid, resinous principle of the kava root, has also a volatile oil, which parti-

vanced to protect piles from its ravages were commented upon by Messrs. Silliman, Behr, Bolander, Hubbard, Yale and Nystrom, the latter remarking that piles of the wood of the palm tree were used in Mexico, and were exempt from the ravages of the Terebo. Mr. Bolander remarked that the wood of the coniferous trees was preferred by them to all others.

Mr. Falkenau read a well written paper upon "The Spirit of the Age and its Influence on the Development of the Natural Sciences."

Mr. Bolander exhibited specimens of an Apocynum, or hemp, found in Round Valley, Mendocino county, on moist land, subject to overflow. It increases rapidly by stoloniferous roots, and is therefore extremely difficult to destroy. The Indians make extensive use of its fibers for fish-lines, etc. The specimens before the Academy were collected by J. S. Silver at Humboldt Valley, Nevada.

Mr. Stearns submitted the following resolution:

*Resolved*, The California Academy of Natural Sciences hereby expresses its thanks to Major James T. Hoyt for his kind invitation, and to Gen. John A. King for his courtesy to its members during their recent visit to Angel Island; and the Secretary is instructed to forward a copy of this resolution to each of the gentlemen named therein.

The subject of another field meeting came up, and it was resolved to visit the country in the neighborhood of the Twelve-mile House in San Mateo county, where there is a fine outcropping of fossiliferous rock and other attractions for the botanists, entomologists, etc.

**MORE OF THE ARIZONA MINES.**—Mr. W. T. Porter, formerly of Washoe, and more recently of Arizona, where he has been engaged in superintending the construction of the smelting works of Martin & Co., on Williams' Fork, a branch of the Colorado, brings very flattering reports from the copper and silver mines of that locality. He represents the climate as delightful during the greater portion of the year, and the field for mining operations inviting and extensive,—capital, however, being a *sine qua non* to the full and complete development of its varied mineral resources. The copper ores are said to average 25 per cent., some of it trebling this amount. The Great Central, Wm. Thompson, superintendent, with two small furnaces, and laboring under the difficulties arising from suitable lining for the same, have been enabled, during the past year, to smelt out in the neighborhood of 40,000 pounds of copper, running to about 95 per cent. With their large furnace, recently built, so soon as the proper fire material arrives on the ground, they will be able to smelt from fifteen to twenty tons of ore per twenty-four hours, producing about four tons of 95 per cent. copper. The lode is well developed and clearly defined.

The Planet mine, under the direction of Capt. Ashley, is also represented by Mr. Porter as containing immense masses of very rich ore, and as exceedingly promising, if not the most valuable ever discovered.

**CONTRIBUTIONS FOR OUR CABINET.**—We have in type notices of quite a number of mineral contributions, which are crowded out this week.

STOCKHAM'S PATENT ROCK-DRILLING MACHINE.

is firmly set in the socket, E, fed forward as fast as necessary, and turned by a screw in the cam-shaft, imperfectly shown at I. FF, represents the radius for elevating or depressing the drill, and L the bottom radius for setting the drill to the right or left.

As will readily be seen, this machine may be operated with unskilled labor. We understand that two men are now doing as much work in a claim on Deer Creek, above Nevada, with one of these machines, as five could do with merely the sledge and drill. A saving of fifty per cent. is also effected in the waste of steel, usually destroyed by the sledge, but saved in the use of this machine by the blow being given by the force of the spring. The inertia of the drill is overcome and its own weight made to do the drilling, assisted by the above-mentioned spring. The labor is found easier than by the old way. A machine is now set up for inspection, to which the mining public are invited, at H. J. Booth & Co's machine works, corner First and Mission streets. For further particulars and price, inquire of V. Cushing, agent, at the above place. The price of the machine is such as brings it within the reach of almost every individual miner.

The Fulton Foundry has recently forwarded two of Hunter's amalgamators to the Pittsburg mining company, at Nevada city.

cipates in its effects in gonorrhoea, gont, rheumatism, dysentery, diarrhoea, etc. When used as a remedial agent, it is necessary to continue its use for a period of from ten to fifteen days; and when the system was under its control its effect externally could be detected in the bloodshot eyes of the patient.

Dr. Behr remarked that the natives chewed the root and spit the juice into a trough, the expectation being allowed to remain until fermentation had taken place, when it was drunk as a beverage, and was highly intoxicating.

Prof. Silliman read an interesting paper on a peculiar mode of the occurrence of gold and silver in copper and iron pyrites in the foothills, especially at the Banker mine, near Lincoln, and at Quail Hill, near Copopolis.

Mr. Knight presented a specimen of polished serpentine taken from the Dry Dock at Hunter's Point.

Prof. Silliman remarked that it was a fine specimen of serpentine, and that it would be valuable for ornamental purposes and for the inside work of houses, but it is not suited for the exterior of walls.

Dr. Cooper made some interesting remarks upon a huge specimen of *Parapholas California*, a large pholad or borer. This mollusk is sometimes known as the date fish, and is highly esteemed by epicures. There are several species of pholads on the coast of California.

Mr. Stearns called the attention of the members to the fact that the Terebo, so destructive to the piles in city wharves, was related to *Parapholas*, being a pholad and borer. The various plans and theories ad-

## Hartman's Improved Safety Rein.

In another column of to-day's issue, will be observed an illustration which shows the arrangement and mode of application of a safety bridle, adapted for use as a driving or riding rein, the former being represented in the engraving. We have been shown a pair of these reins which is of very neat construction, and would scarcely appear to the casual observer to be anything different from the ordinary check-rein. The safety rein starts from the inside of the check piece; runs through the ring of the bit, then through the pulley near the top of the head-stall, thence entering the main lines at the terrets. The main lines, from that point, being made hollow, the safety cord readily passes through them to the hand-piece, where they are seen to present two small loops, by which they can readily be operated by the driver whenever necessity requires. By drawing slightly on the safety rein, the bit is taken up into the upper or fleshy part of the mouth, reining the head up instead of against the breast. By this means it is claimed that the most vicious horse can readily be brought under perfect control in a moment of time. It is as readily adjusted to a double as to a single harness, and with the same effect, each horse being checked separately, the checking being confined to any one, or all, at the option of the driver.

State and county rights for the above are for sale for the Pacific coast and all territories belonging to the United States, by Reithman & Sain, 615 Sacramento street.

**MINERS' LIEN—A GOOD LAW.**—In February last, the Legislature of Nevada passed an act supplementary to the Mechanics' Lien Act of that State, by which all miners or other persons performing labor to the amount of \$20 upon any mine, whether of quartz or "pay dirt," should have a lien upon the claim, together with the improvements thereon. This is just and right. "The laborer is worthy of his hire;" whether he be a carpenter or a miner. In this matter our sister State has the advantage of us.

**CAPT. WORDEN**, the *Monitor* hero, has accepted the invitation to meet his friends and the citizens of San Francisco, at the rooms of the Board of Supervisors, and has designated Thursday, the 25th inst., at 12 o'clock, M., as the time.

## Communications.

IN THIS DEPARTMENT we invite the FREE DISCUSSION of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[Written for the Mining and Scientific Press.]

## Boiler Destruction—Its Causes and Remedy.

EDITORS PRESS:—The subject of the present communication is not of that class by which a man can get either fame or profit; but every man of science ought to consider it his duty to bring before the public his experience in any branch of science whereby the community can be benefited. In England there are several associations which are continually in search of the causes of, and means to prevent, steam-boiler explosions. Their labors are not rewarded by handsome presents, nor are even their names brought before the public; they appear to be inspired by a higher motive than common reward; their efforts are for the common good, and through their labors many valuable lives and much property has been saved.

What has ever been done in California to prevent steam-boiler explosions? Nothing. It is true we have a United States law on the Statute Book, which, when properly carried out, may be of considerable value as a safeguard, especially for marine boilers. But I have lately seen a boiler in this city, and in a populous part of it, too, where the iron was so much eaten away as hardly to leave a sound spot. I am not aware that it is the duty of the Steamboiler Inspector to look after such matters; but if it is, he ought to attend closer to his business.

A boiler explosion is a terrible thing. It usually carries destruction to life and property when it occurs; hence, we ought to study its causes, and endeavor to prevent its occurrence.

During the year 1866, I had occasional opportunities to examine steam-boilers, which, though not a year old, were nearly destroyed by rust, more particularly at the Mount Diablo coal mines. The water there is generally impregnated with sulphate of iron, etc., which, on being heated in the boiler, produces sulphuric acid, which acts rapidly on the iron, and the consequence is that if a fatal explosion does not occur, a gradual destruction of the boiler is inevitable. I was called upon to analyze the water used for the boiler at one of the coal mines of that neighborhood, which had a boiler so attacked that it began to leak badly. I advised the neutralization of the acid in the feed water. My suggestion being acted on, the same boiler is now, after six months use, as good as can be desired.

The remedy in such cases often lies near at hand, if we only know how to apply it. Every one who uses a steam-boiler, and wishes to save it from early destruction, ought to know what the water holds in solution before they use it.

Besides the impurities contained naturally in the water, there are often other circumstances which are the causes of boiler destruction. One of these cases, of a most singular character, has recently been communicated to me from Germany, and may be described as follows:

Six boilers, thirty feet long by six feet diameter, were erected for the purpose of driving the blasting engines of some new iron furnaces. In order to try the capacity of the machinery, it was to be tested for a fortnight before the fires of the blast furnaces were lighted. All went off as could be wished—the entire plant of machinery running for a week all right; but on the eighth day the trouble began. One boiler began to leak at several rivets; the leaks were caulked, and it was all right until next day, when two other boilers showed the same defect; the tenth day the remaining three began to leak like the former; on the eleventh day the caulking and all other remedies were fruitless. The fire-place was changed to the other end of the boiler, with no better result. On the twelfth day the boilers began to leak so badly that the fire was extinguished. The boilers were then carefully examined inside and outside; the iron and workmanship all seemed right; the water used was analyzed, and nothing injurious was found in it. Another new boiler was constructed of the best of iron, for a test. After

ten days working, that was destroyed like the first six. On close examination of the contents, it was found that no incrustation had taken place, except on the bottom of the boiler, where was found a soap-like sediment, which proved to be a fatty acid, originating from the use of the condensed water. This fat covered the sides of the boiler with a very thin film, and whenever the hoiling water within the boiler touched it, the water was repelled with such force and noise that it often sounded as if iron balls were thrown from one side of the boiler to the other.

Further investigations demonstrated the fact that when water was used as it came from the well, without the use of the condensed steam, all went on well; and that it was the oil only which caused all the trouble encountered by preventing the water from coming in contact with the walls of the boiler, thus giving the fire ample opportunity to work their ruin.

I have often seen in California that the condensed steam was led into the feed water, consequently carrying along with it a large amount of oil, which ought to be avoided whenever possible. The oil as well as the water ought to be carefully analyzed, the importance of which is too apparent to need any further mention. J. MOSHEIMER.

## The Reese River Country and its Mines.

BY A. J. HOWE.

NUMBER ONE.

The vast extent of territory coming under the general name of Reese River country, has been gradually explored during the past two years till it is found to be literally one field of metalliferous veins, producing the precious metals, especially silver, in the greatest profusion, and the inferior metals in great abundance and variety. The northern and central portion of this silver region, which I will mark out by the natural boundaries of Humboldt river on the north, the Colorado on the south, and Utah on the east, and comprising the whole of Lander and Nye counties, is traversed by parallel ranges of mountains running north and south. These ranges are narrow and uniform in appearance at a distant view, and generally covered with a growth of nutpine or piñon, the most westerly ranges having the heaviest growth. Between these parallel ranges lie valleys of great extent, generally quite level, except along the foothills of the ranges, where it is undulating and everywhere covered with artemisia or sage brush; wherever a mountain stream reaches down into these foothills, highly productive land is found along its borders. The ranges and foothills, from their base to the highest peaks, are everywhere covered with a luxuriant growth of a great variety of grasses, prominent among which is the hunch grass, the most nutritious known.

In the southern portion of this region the mountain ranges are more irregular and detached, frequently quite destitute of timber, but everywhere abounding in sufficient grass to make this whole region pre-eminently a grazing country.

It is in these mountain ranges that the rich silver lodes occur; none are barren in this respect, although there are long reaches, in all, that produce no mines or veins of quartz. Each range lays claim to superiority in richness of its silver lodes; but an impartial visitor will scarcely know to which to give the preference; certainly all contain many mines that are at least locally famous.

AUSTIN AND VICINITY.

The public are too familiar with the discovery and progress of this far-famed district, to need any extended notice at this late day. It was here that the first silver was accidentally discovered in May, 1862, by W. M. Talcott, one of the Pony Express riders, when that institution was the wonder in rapid communication between California and the East. The district was organized on the 10th of May. Soon after, the discovery became whispered about, and thousands rushed here from Virginia City, and a little later from California and other parts. A town of four or five thousand inhabitants sprung up like magic, built along the narrow cañon between the two hills that contain the principal lodes. Hundreds of lodes were located in this, which was called

Reese River District, and the adjoining district of Amador on the north. In a short time several mills were erected, "feet" changed hands at enormous prices, and for some time all went swimmingly. But the reaction that must inevitably follow such insane rushes came, and none too soon for the future welfare of Austin. It became whispered about that the lodes did not extend down; in fact, among those on the "inside" it went from mouth to mouth that the rich lodes were already worked out root and branch. Then everybody was on the street, armed with his certificates of stock, anxiously looking for a buyer. Meantime, a few persevering miners were slowly pushing down on their works, and it soon came out that the lodes did run down. (I will mention among those entitled to credit for their perseverance in this respect, the then owners of the Oregon and North Star mines). Austin was saved, and has to this day flourished with varied degrees of prosperity. Their greatest mistake has been in erecting numerous costly and substantial quartz mills before the mines were prepared to supply them with ore; as it is now established that the reliable ores lie below the water line. Austin is now in the ascendant. The system of vertical shafts sunk to great depths, has been inaugurated, and her magnificent mills will ere long bristle with industry. Union and Lander hills will at no distant day be crowded with hoisting works bringing to the surface the wonderfully rich and beautiful ruby ore, for which they are so justly famous. We will now proceed south along the low undulating sage-covered foothills of the Toiyabe range to

BIG CREEK.

Twelve miles from Austin we come to a broad cañon, through which flows a beautiful crystal stream. In the exciting days of 1863, hundreds of prospectors and speculators flocked here; a succession of towns—Watertown, Cañon City and Montrose—were laid out and partially built up. Before the crazy inhabitants had time to look over the hills and determine whether there were mines here or not, two quartz mills were in course of erection, and it seemed to be the prevalent idea that all the hills of the Toiyabe would alike yield the shining ore. Bare lots along the main street sold readily for \$200 to \$700 each. Several hundred locations were made, claiming quartz lodes, which, in most instances, only appeared, to a sane man, on the written notices, or in the imagination of the claimants. The town was soon flooded with nicely engraved certificates of stock, representing shares in the various incorporated "hills" and "wild cats" of the district, and the streets swarmed with a motley crowd of sharpers and pioneers, each seeking out his victim from among the better dressed, but verdant new-comers. Immigration was for a time turned from Austin. September and October, 1863, found Big Creek in a fair way to outstrip Virginia City in growth and size. In December, the scales began to fall from the eyes of the inhabitants, the crash came, and the glory of Watertown, Cañon City and Montrose, departed forever, except in the line of vegetable and pig ranches, for which they are admirably adapted; for truly, Big Creek Cañon may be called one of the oases of Central Nevada.

At the lower end of Watertown now stands the Parrott mill, a fine structure of twenty stamps, erected in 1863-4. This has been idle, with the exception of occasional spasms, since its completion. There is talk of removing it to Northumberland or Hot Creek, where it might at once enter a season of usefulness and enrich its owners.

[To be continued.]

BILLIARD TABLES, of a style both new and beautiful, more particularly as to the carved work, the form and varied color of the feet, as well as in the general harmony of the whole, may now be seen at the manufactory of Messrs. Strahle & Hughes, 567 Market street. We understand that orders for upwards of thirty of these fine specimens of workmanship—all neatly furnished with the Phelan patent cushion—have been recently received, coming chiefly from the Bank Exchange and Cosmopolitan Hotel, in this city, and from the Union Hotel at Sacramento. But, as in the "human form divine," a well-turned ankle is often the great object of attraction, so in this case, the foot, made as it is of the finest California laurel—retaining in part the natural color of the wood; in other portions stained so as to resemble rosewood or mahogany—with the carving most artistically executed; and, viewed in connection with the pleasing contrast of each varying tint, presents as a work of art a picture of beauty but rarely seen.

[Written for the Mining and Scientific Press.]

## The Question of "Gravity"—Reply to "A. C. D."

EDITORS PRESS:—The error into which your correspondent "A. C. D." falls, on the subject of differences of weight at different points of the earth's surface, is easily detected. He is correct in saying that attraction varies as the quantity of matter in the attracting bodies, and their distance from each other; but he errs in estimating that distance.

There is, in every body, a point called the "center of gravity," which has this peculiar property, that the attraction of the whole mass acts precisely as if it (the mass) were all collected in that one point.

In figures of regular shape and density this point is at their center of figure; hence, the center of the earth is also its center of gravity, and that is the point to measure from in all calculations on the earth's attraction.

Now, the polar distance from the center is 3949.5 miles, and the equatorial distance 3962.5 miles, and as attraction (or weight) decreases as the square of the distance, we have  $\frac{(3949.5)^2}{(3962.5)^2} = .998449$ , which decimal

represents the weight at the equator of a body weighing one pound at the pole; in other words, 1,000,000 pounds at the pole would weigh but 993,449 pounds at the equator, owing to increased distance from the center of the earth.

There is an additional loss of weight at the equator—about 1.295th—owing to centrifugal force caused by the revolution of the earth on its axis; and when this is also deducted, we find that a mass weighing 1,000,000 pounds at the pole would weigh only 990,060 pounds at the equator.

All of the above can be demonstrated as conclusively as any problem in geometry, but it would be absurd to fill the columns of the Press with the contents of a textbook. Indeed, a little patient study of the whole subject in some elementary work would have removed all misconception, and saved discussion in your columns as well as those of the *American Artisan*.

MACHINIST.

San Francisco, April 15, 1867.

WHAT NEXT?—We have received the circular of the "United States Mutual Piano Forte Association," of New York. It proposes to furnish a first-class instrument, at a low price, payable in installments, to any one who chooses to connect himself with the association.

The evidently philanthropic motives of the getters-up of this circular, are beyond praise. Those benevolent individuals, who inaugurate "gift enterprises,"—in which tin whistles and brass watch-chains are distributed with such reckless disregard of expense, as prizes, to all those victims who have paid one dollar apiece for their tickets—have become conscious that that sort of thing is "played out." Some new dodge is consequently necessary; else, like Othello, "their occupation's gone."

Lest the animus of this remark may be mistaken, we hasten to say that we do not mean to imply that the scheme under consideration, is merely a new phase of the aforesaid species of swindle. Although the offer of a \$600 piano for \$360, might seem slightly suspicious to an evil-minded cynic, we believe the thing to have been prompted by purely disinterested motives. A true music lover, of course, desires to see a piano placed in every hovel in the land. Nevertheless, painful as it may be, we feel ourselves constrained to say to this association, which has proposed to advertise the arrangement in our columns:—It won't do, gentlemen! It is no go! Californians are not so "jolly green" as all that! Besides they don't make purchases by installments. When a Californian wants a piano, he just takes the money, and goes and buys it!

The circular announces the capital stock as \$50,000, to be increased to \$300,000. When such increase is to be made, is not stated; but probably as soon as the accumulated contributions of a sufficient number of soft-heads will permit! We would advise the company to confine its operations to the Atlantic side of the Continent.

## Mechanical.

**TESTING BESSEMER STEEL.**—At a recent meeting of the Association of Foremen Engineers, Loudon, Mr. Naylor described his method of testing steel. It had been his fortune to have much to do with Bessemer steel, and he had found some uncertainty in its duration. It was always submitted, under his direction, to a variety of tests. For example, with regard to rails, his plan was to take a piece of rail, as a sample of a batch, five feet long, and to rest it on supports three feet apart. A weight of one ton was then allowed to fall through thirty feet, and strike it midway between the supports. If the rail broke under the blow, all the steel cast that day for the same purpose was rejected. Another test was to place the same rail, if unbroken, on the three-foot bearings and submit it to a strain of thirty tons; if the deflection under this ordeal exceeded half an inch, rejection followed. For testing tensile strength a bar was drawn from twelve inches to thirteen inches and a half long. A fourth test consisted in the planing of a bar to three-quarters of an inch square, and then twisting it to one turn in two inches and a half. Tests were also applied for ascertaining the power of Bessemer steel to resist compression, etc.

**FOR AERIAL NAVIGATION.**—M. Gifford has constructed a steam engine for aerial navigation, whose weight bears a very small proportion to that of ordinary engines of equal power. The first model, constructed under his superintendence, has been worked with success at a pressure of 900 pounds to the square inch, and he is sanguine that he will be able to increase the pressure to 3,000 pounds. It is thought that this engine will be able to force a balloon of an elongated shape, at the rate of thirty miles an hour through a calm atmosphere—carrying three days supply of food and water.

**HARD HYDRAULIC CEMENT.**—The following recipe is given for a cement which it is said has been used with great success in covering terraces, lining basins, soldering stones, etc., and everywhere resists the filtration of water; it is so hard that it scratches iron. It is formed of sixty-three parts of well-burned brick and seven parts litharge, made plastic with linsed oil. The brick and litharge are pulverized; the latter must always be reduced to a very fine powder; they are mixed together, and enough of linsed oil added. It is then applied in the manner of plaster, the body that is to be covered being previously wet with a sponge. This precaution is indispensable, otherwise the oil would filter through the body and prevent the mastic from acquiring the desired hardness. When it is extended over a large surface, it sometimes happens to have flaws in it, which must be filled up with a fresh quantity of the cement. In three or four days it becomes firm. If its advantages have not been overrated, it must be a very excellent cement for making the joints of aquariums water-tight.

**A MONSTER SAW** has been on exhibition in New York, intended for the Paris Exhibition, which is said to be the largest ever manufactured. It is 88 inches, or eight feet four inches in diameter, of one solid plate, from the works of Messrs. W. Jessop & Sons, England, and weighed, before finishing, 500 pounds. The saw is one of Emerson's patent, having movable teeth which are secured in the plate by V-shaped grooves with corresponding tenons and one rivet to each tooth. The thickness of the finished saw at the center is No. 2 Stubbs' wire gage, and at the edge, No. 5. The saw was made by the American Saw Company at their works at Trenton, N. J. It will be a prominent feature of American industry at the Paris Exposition.

**WHEN TO PAINT.**—Experiments indicate that paint on surfaces exposed to the sun will be much more durable if applied in autumn or spring, than if put on during hot weather. In cold weather it dries slowly, forms a hard, glossy coat, tough like glass; applied in warm weather, the oil strikes into the wood, leaving the paint so dry that it is rapidly heated off by rains.

**EXPERIMENTS** on wheat under glass, prove that the weevil retains life longer than any other insect when deprived of air.

## Iron Floating Dock at St. Thomas, West Indies.

We are indebted to Capt. J. B. Caldebeck, now en route per Colorado for Singapore, as agent at that port of the Peninsula and Oriental Steam Navigation Company, for the following very interesting notice of the new dock at St. Thomas, it having been minutely inspected by that gentleman a few weeks ago, when on his way to this country:

This fine structure will be opened in June of the present year, and will be of incalculable value to the shipping interest; vessels damaged perhaps in the very neighborhood of St. Thomas, having hitherto been obliged to go to Havana, frequently incurring great risk on their way, in addition to a serious loss of time.

The Dock is being constructed from the designs of the English Civil Engineer, Mr. F. J. Bramwell, the Constructor being Mr. N. Scott Russell, of the Bute Iron Works, Cardiff, South Wales. Mr. Patrick is the Superintending Engineer for putting the fabric together at St. Thomas, and Mr. Alexander Wylie, for many years a Chief Engineer in the service of the Royal Mail Steam Packet Company, has been appointed Dock Master.

The Dock is open at the ends, and the sides, instead of being plated up solid, are composed of latticed iron girders, in six bays or divisions, thus securing ample ventilation in a hot climate, and affording a very elegant and graceful appearance. The bottom is formed by six pontoons, all of the same dimensions, viz: 50 feet in length by 100 in breadth, each one of which can be disconnected and placed in the Dock for repairs or painting; thickness of plating of pontoons, one-half inch, and the bottoms inside are coated with Portland cement two inches thick. The Dock is 300 feet in length upon the blocks. The outside width is 100 feet, and breadth, inside, 70 feet. The weight of the material is 3,300 tons; and 4,600 tons will be lifted in two hours and a half. A ship drawing 20 feet will be taken upon the highest blocks.

There are, independent of the pontoons, six water-tight iron floats, or small pontoons, on each side, each 49 feet long, 11 wide and 5 feet deep. These floats are intended as regulators for the adjustment of the trim of the dock when falling or rising. They are worked by long screws reaching to the upper part or platform of the lofty frame-work, and are turned by steam engines placed on the platform. These floats being situated in the wings, tend also to secure the stability of the fabric as far as listing over on one side is concerned.

There are two pumping engines, 12-horse power each, six pumps being fitted on each side; their diameter is 17 inches; stroke, 2 feet—all chambers, buckets and clacks being made of brass. In order to form a cradle adapting itself to the lines of the various builds of vessels that may enter the dock, bilge shores of East Indies teak wood, 12 inches square, are placed 15 feet apart for a length of 180 feet. These shores, or rather frames of a cradle, are supported by heavy iron legs, the heels of which are caught, acting as pawls in horizontal pawl-bits located on bottom of dock, and placed at right angles to the keel of the vessel.

The Dock will be moored in six and one-half fathoms in the "Great Careening Hole," that position affording the most sheltered berth in the harbor, and in which the Danish men-of-war find the most perfect security during the hurricane months.

**CEMENT TO FASTEN IRON IN STONE.**—A German Professor has found out a cement for fastening iron in stone which, in forty-eight hours, becomes nearly as hard as the stone itself. This consists of six parts of Portland cement, one part of nicely-powdered lime, burned but not slacked, two parts of sand, and one part of slacked lime. This, when well mixed, and reduced to one mass of cement with the necessary quantity of water, is put in the crevices or the openings of the stone and the iron, both being previously damped, and after forty-eight hours the iron will be found thoroughly and lastingly fastened in the stone.

**A MALLEABLE CAST IRON** of great strength, toughness and hardness, is reported to be produced by a secret process by McHaffio, Forsyth & Miller, of Glasgow. It has been used under important contracts for propeller screws, mast tops, hawse pipes, etc., etc. The teeth of pinions cast by this process have been hammered down to the solid mass without cracking.

## Scientific Miscellany.

## Great Astronomical Problem.

Among the most important "unfinished problems of the universe," one of the chiefest is the search after the great sun or crater, about which all other orbs and systems are supposed to be revolving. Admitting that there is such a motion in the stellar universe, can this grand central body or system of bodies be found?

When Sir William Herschel announced that he had discovered a point in the heavens toward which our solar system was sweeping, even the boldest of astronomers were unwilling to believe it. It was a pioneer announcement, so novel and so astounding that the world was unprepared for it. Yet, the keen eye and careful observations of that eminent astronomer had detected a most important fact, which has since been fully demonstrated, and is now received as beyond a question.

The idea of such a movement at once set the astronomers of Europe upon the *qui vive* to determine its import; and the German astronomer Maedler soon put forth his grand conception of a common center or gravity, and the fact of such an existence has since been universally acknowledged. Where and what it is, is now the great object of research—one of the present "great unfinished problems of the universe." Can it be found? Philosophy to-day answers in the affirmative, even if we are forced to admit that there is no central controlling body. The time will most assuredly come when this question will be answered fully, and in the affirmative. Years, perhaps centuries, may roll away before that day arrives; but the exact solution of the problem has been commenced, and the work will be carried steadily on, until all the data necessary to master it shall have been collected. The materials for that solution are constantly increasing, and will continue to accumulate from generation to generation. It is no objection, no discouragement, that the final accomplishment is afar off.

The old astronomers who once stood upon the walls of Babylon, or upon the pyramids of Egypt, and waited, night after night, the varying phenomena of the heavens, carefully timing and noting the eclipses of the sun and moon as they came and went, did not labor for their own day and generation. They felt an inward assurance that by a constant watching for and careful noting of the recurrence of the great cycles performed by sun, moon and stars, something of importance would ultimately be gained to after generations. It was by such patient waiting and watching that astronomy received its first impulse, and the foundation was laid for that grandest and noblest of all the sciences which have been opened up to man; one which is now so simplified, that the merest school-boy can he readily taught in a few minutes that which has cost the closest scientific research of generations of philosophers.

So it is with the patient watching and waiting of astronomers of the present day. Notwithstanding the wonderful advances which have been made in this science during the last century and a half, they are still looking for, perhaps, equally grand and important results in the future, to accomplish which they shrink from no responsibility and think it no hardship to labor, although the fruits of those labors may be only for those who are to take our places hundreds or thousands of years hence. In the language of the lamented Mitchel: "The great and mighty problem of the universe has been given to the whole human family for its solution. Not by any clime, not by any age not by any nation, not by any individual man or mind, however great or grand, has this wondrous solution been accomplished; but it is the problem of humanity, and it will last as long as humanity shall exist on the globe in which we live."

REV. E. BURGESS has just closed a course of lectures on the Antiquity of Man, before the Lowell Institute, of Boston, which received a unanimous vote of thanks from his audience. The *Congregationalist* of that city alludes to the lectures as follows:

Mr. Burgess sustained the Mosaic records in regard to the origin and antiquity of the human race. He prefers the chronology of the Septuagint, which, according to Hales, places the date of the creation of man at about B. C. 5411, and that of the Flood at B. C. 3153; he would vary these numbers a little, but regards them as approximately correct. He showed that the records of all historic nations—as the Egyptians, Greeks and Romans, Chaldeans, Hindus and Chinese—both historical and monumental—contain nothing which necessarily conflicts with the Mosaic chronology, but much which directly corroborates it; there is nothing in the records of any heathen nation that set aside, or even render doubtful the time of man's creation. If that date is not correct, there is nothing outside the Jewish Sacred Scriptures which can correct it.

In the argument from Language and Ethnology it was shown that there are converging lines—linguistic and ethnic—that point to central Asia as the center from which the nations of antiquity migrated to the seats they occupied when they first appeared on the stage of history. The argument from Mythology led to the same general conclusion. All the so-called systems of ancient mythology had a common origin, and that origin—in its origin and essential elements—was in the facts, persons, and events described in the Mosaic records. One lecture was occupied in the discussion of the Unity of the Human Race, in which the theory of Agassiz in particular, which makes eight centers of creation for mankind, was reviewed. That distinguished naturalist, however, regards all the varieties as constituting only one species.

The closing lecture was occupied with the argument from geology. A few of the strongest cases that have been relied upon as proving a high human antiquity of man were examined, and it was shown from indisputable facts, and from the opinions and admissions of geologists themselves that these cases involve so many elements that they do not *prove*—or even render probable—the high human antiquity they are alleged to establish. In short, the "conclusion of the whole matter" was, that there is nothing among the facts of geological science, which should be permitted, in regard to the commencement of human existence on earth, to set aside the chronology of the Mosaic records.

**NEW HYDROCARBONS.**—When cannel coal is distilled, and the product is treated with acid, the oils belonging to the marsh gas and benzol series are separated, and a black, tarry mass remains. From this mass a brown liquid, having an offensive smell, may be distilled at a temperature between 300° and 400°. Schorlemmer, by repeatedly distilling this liquid with caustic alkali and with sodium, has obtained a new series of hydrocarbons, which differ from the homologues of olefant gas by the addition of two atoms of carbon. Taking the weight of an atom of carbon at twelve and hydrogen at one, the new bodies are represented by 12 C 20 H; 14 C 24 H; 16 C 28 H. The old nomenclature provides no names for these compounds.

**SOUND AND COLOR VIBRATIONS.**—It is said that the deepest note which the human ear perceives as a continuous sound, is produced by sixteen vibrations in a second; the acutest by 43,000. The extremes of color are red and violet; the former given by 458 billions of vibrations per second, and the latter by 727 billions. The relative velocities of light and sound, and the relative refinement of the media through which their effects are conveyed, are illustrated by this comparison.

**THE FREEZING PROCESS.**—In obtaining concentrated mineral waters by the freezing process, the water is kept in a constant agitation during the process, by which the part frozen collects in the form of a milky snow. After this has been separated, the balance of the water containing all the substances is then still further concentrated by boiling.

**PURE IRON**, when exposed in a finely divided state to the action of the atmosphere becomes red hot. In other words, so very strong is its affinity for oxygen, that when reduced to powder it will ignite spontaneously.

## New Patents and Inventions.

Under this heading we shall mention, from week to week as occasion may demand, New and Important Inventions; also, the List of Patent Claims recently issued from the U. S. Patent Office to inventors on the Pacific Coast, and other Patent Issues which we deem of local interest to readers on this side of the Continent. Most Patents on this coast are secured through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We are prepared to obtain from Washington, with despatch, copies of any Patent issued.

## RECENT INVENTIONS.

**INTERESTING TO SHOE MANUFACTURERS.** Evan T. Rogers, of San Francisco, has made application through the MINING AND SCIENTIFIC PRESS PATENT AGENCY, for a patent for a new invention, designed to do away with the old system of rule and lines in making counters and shapes for machine work or hand sewing or stitching, so that, by the use of this device one man will be able to perform more labor than two by the old method, and do it much easier and more correct. The marking is done by a stamp and effected at one blow.

**LATHROP'S HARVESTER.**—While at San José last week, we had the pleasure of seeing this important California invention. It is simple and compact, and appears to be all that could be reasonably desired. Patents have been applied for. Two of Mr. Lathrop's sons are now in the Atlantic States making arrangements for selling patent rights and manufacturing the machines. We shall in due time give a full description of this harvester.

Mr. Lathrop has also a new gang plow, made without land sides, the plow being kept to land by the aid of a rotary coulter.

## PATENTS RECENTLY ISSUED.

62,749.—**ORE CONCENTRATOR.**—Morgan Hungerford, San Francisco, Cal.:

I claim, 1st, A pan cut in two and dropped about one inch, so that the lowest depression shall be two inches, more or less, below the ridge or angle of such concentrator, substantially as described and for the purpose set forth.

2d, The slots or outlets, F, F, above the line of the groove around the inner rim, as described.

3d, The outer rim, G, with stops, H, H, also the discharge holes, J, J, under the pan around the said outer rim, substantially as described and for the purpose set forth.

The above is an improvement on the Prater & Hungerford Separator, for separating sulphurets of gold, silver or copper from their sands and other matter from which it is desirable to free them. The nature of the invention consists in the employment of a circular disk, cut in two, each side dropping about one inch, more or less, from the central line of division, with a groove around the periphery, and with an outer rim around the pan, said ring being provided with stops placed at opposite sides. The inventor claims that the efforts heretofore made to concentrate sulphurets by means of a current of water passing over a convex disk, have, in a measure, been unsuccessful, from the fact, among others, that a large portion of the sand and debris which is contained in them is carried into the amalgam or quicksilver channels, from which it must be afterwards separated by a still more laborious process, or go to increase the quantity of useless matter in the sulphurets, and add to the cost of treating them for such silver, gold or copper as they may contain. The object of the above invention is to obviate this difficulty, and thereby simplify and cheapen the process of obtaining the metals from their combination of sulphur and other base matter.

672,766.—**PLOW IMPROVEMENT.**—Don Carlos Matteson and Freeman P. Williamson, Stockton, California:

We claim, 1st, The curved standard, A, with the lug, B, and the offsets, D and E, substantially as and for the purpose described.

2d, The curved mold-board, F, with its two complete edges, H and H', attached to the standards as shown, and operated substantially as and for the purpose herein described.

The nature of the above invention is to provide an improved plow, which is made with a mold-board, having a double edge, and so constructed that by simply removing the two retaining bolts it can be reversed, and a new and sharp edge brought into use. The standard which holds it to the beams has also a peculiar construction, which, together with certain offsets, prevents it from becoming clogged with weeds, while by means of a prospecting lug on its top, the attachment to the beam is rendered much firmer. By constructing a plow in this manner, greater strength is obtained, the mold-board will always have a sharp edge, and can be easily replaced, when necessary, while as an article of manufacture it can be afforded much cheaper than those of the ordinary construction.

**THE PEARL SHIRT FACTORY.**—Martin L. Haas, proprietor of the above named works, opened with the new year, at the corner of Sansome and Halleck streets, on a basis both substantial and permanent, and is confined exclusively to the manufacture of the white "Pearl Shirt"—the material used being of the best and finest linen and cotton the market affords. Its success is no longer problematical. In comparison with some of the favorite brands of the East, such as the "Star," "Medal," "Davis & Jones," and other popular styles, it has fully stood the test, having been pronounced by the trade in every respect equal to the latter, even as to the appearance of the laundry-work, which has hitherto been the most difficult of execution. When quality of material, sewing, style, fineness of finish, and cheapness, are taken into consideration, it is believed to be far superior to anything of the kind imported. Already has the establishment been able to furnish at least fifty operatives with steady employment, and the market with 500 dozen shirts per month, having at the same time facilities for increasing the number of employes, and the supply of its pearls in proportion to the demand of the trade. The machinery, for instance, for plaiting the bosoms, will perform with ease the work of ten hands, while with an improved machine of his own construction for rolling and laying the cloth to the required number of thicknesses, which is from two to four dozen, a skillful operator, such as is here employed, will cut from fifty to sixty dozen per day, each of the different parts being cut at a single operation. A skillful workman will make up from fifteen to twenty dozen shirts per month, and receives for his services from \$40 to \$65. As not less than 200,000 dozen of these most necessary articles of a gentleman's wardrobe will barely supply the wants of this coast, giving employment to 5,000 operatives, it becomes a matter of no small interest, not only to dealers, but to all others looking to the future of the Pacific States, to foster all enterprises such as that in which Mr. Haas is now engaged.

**UTILIZATION OF THE SOAP ROOT.**—The fiber of the soap root, long looked upon as utterly worthless, is fast becoming a useful and important servant to our wants. Whether it has ever yet been trodden under foot or spit upon as a mat for our floors, as it should be, we know not; but it stands ready, as scrubbing brush, to wipe out every stain from the floor or its past reputation, or any foul aspersion cast upon either.

It climbs the loftiest flue as a chimney-sweep, and is welcomed alike in parlor or bedroom; as a lounge for luxurious ease in the one, or as a couch for inviting repose in the other. Of such consequence has it become in this respect, that a machine has been recently patented for curling the fiber and giving it the necessary elasticity to adapt it to the uses above described. As a material for a certain class of brushes, it is believed to be far superior to any American bristle, and fully equal to the best imported Russian. The San Francisco Brush Factory, No. 211 California street, although of very recent origin, is now manufacturing almost every different kind of brush to be found in the market, and receiving orders, as stated in their card, at lower prices than cost of Eastern manufacture—turning them out at the rate of 200 dozen per month—hoping not only to be able to fill all orders for home consumption, as fast as received, but soon to introduce a large quantity of goods of a certain class into the Eastern market. To this end no less than 100,000 pounds of the prepared fabric have been ordered from the interior, to be delivered at the factory the ensuing summer.

We understand, also, that Messrs. Feldman & Co. have the exclusive right here, for the patent rattan, street and stable broom, which is said to be much sought after by the miners for washing out their flumes, being stiffer and much more durable than those usually employed for that purpose,

## Weekly Stock Circular.

Of Associated Brokers of the S. F. Stock and Exchange Board.

SAN FRANCISCO, SATURDAY MORNING, April 20, 1867.

## CITY STOCKS.

Transactions in San Francisco Gas stock have been quite large during the past week, selling at \$65@67 per share, then at \$65.50 @ \$66, closing yesterday at \$66.50. California Steam Navigation Company receded from 72½ to 68 ¾ cent.; closing yesterday at 72½. Spring Valley Water Company sold at \$67.50. Union Insurance Company sold at \$105 per share; National Insurance at \$74.

The receipts of the five San Francisco city railroad companies, as returned to the Internal Revenue Department, for the quarter ending March 31, were as follows. The returns are made in currency, the established rate being 74½ cents in January, 73½ cents in February, and 75 cents in March:

	January.	February.	March.
Omnibus.....	\$18,904	\$18,551	\$20,289
North Beach and Mission..	17,166	16,080	17,480
Central.....	10,607	9,933	11,023
Front-st., Mission and Ocean	4,863	4,565	5,500
Market.....	3,595	3,733	6,631
Totals.....	\$55,135	\$52,892	\$60,923

The aggregate sales in the Stock Board, during the month of March, were as follows:

March, 1864.....	\$2,975,795	March, 1865.....	\$5,239,034
March, 1866.....	5,623,900	March, 1867.....	4,034,239

## MINING SHARE MARKET.

The business of the Board during the week has been larger than any previous like period for months past. With scarce an exception stocks have been buoyant and at better prices. Many claims will show an increased yield this month, and their present condition is such as to inspire the belief that they are not likely to be less productive for some time to come. We understand that parties representing a large "short" interest in a certain stock have made overtures for a settlement, upon a basis of about \$2,400 per foot, which it is not likely will be accepted.

**HALE & NORCROSS**—continues to be firmly held in a few hands; during the week under review \$3,500 was bid. The managers of this mine keep carefully arranged tablos of the assays, workings and product of its ores, which are exceedingly valuable and instructive as illustrating the results obtained from similar ores worked in different mills, the varying proportions of gold contained in the bullion in different portions of the lode, and the large proportion of the bullion lost in working. From the tablo for the six months ending in February, 1867, we learn that during that period 15,639 tons of ore were reduced, the value of the bullion in which, according to assay, was \$1,288,132.79, but only \$816,977.62 was obtained, and \$471,155.17 was lost. In fourteen out of thirty-two workings during the six months, the gold exceeded the silver in the bullion to the amount of \$12,908.49, and in the other eighteen workings the silver exceeded the gold to the amount of \$35,570.13. In this, as in all the other mines on the Comstock lode, the deeper the development the smaller proportion of gold in the bullion. These very comprehensive tables of the assay value and actual yield of the ores are invaluable as demonstrating the varying per cent. obtained by different amalgamators. The ore was reduced at thirteen different mills, and the per cent. extracted was very much larger in some mills than that obtained from others. If all mine owners were to compile such tables, they would be able to tell where to send poor and where to send rich ores for reduction.

**SAVAGE**—rapidly advanced over our previous quotations; opening at \$2,600, improving to \$2,750, declining to \$2,600@2,675, and closing at \$2,590. During the week ending April 13th, this mine yielded 1,606 tons of ore, giving an assay value of \$70,775, or \$44.06 per ton, being \$3.60 per ton more than the yield of the previous week. This amount came from the following localities: Old upper works, 79 tons; sixth station, 260 tons; seventh station, 876 tons; Curtis shaft works, 391 tons. The Curtis shaft has been sunk twenty feet towards the fourth station during the week under review. The recent

storms have again materially retarded shipments of ore. The restraining order pending against this company for some time past was removed on the 13th instant.

**CROWN POINT**—declined from \$1,350 to \$1,180, rallied to \$1,260@1,340, and closed yesterday at \$1,400. In the east drift from the 500-foot level the recently discovered body of ore has been penetrated, and is said to be eight feet wide. It is reported that water has interfered with the further prosecution of work at this point since the 11th instant. During the week ending April 12th, 493 tons of ore were taken from the mine.

**YELLOW JACKET**—improved from \$1,190 to \$1,254, receded to \$1,195, then sold at \$1,235@1,250, and closed at \$1,240. We cannot enter into particulars concerning the condition of this mine for reasons frequently stated, viz.: remissness on the part of officials in Virginia City in sending information to the company's office in this city.

**GOULD & CURRY**—sold to a larger extent than usual, rising from \$400 to \$500@590, dropping to \$435, and closing yesterday at \$480. It is the intention of this company to resume work at an early day at the following points of their mine: in the south drift from the fifth station—towards the Savage ground—which is in fifty feet; in the fourth station drift south, running east; and from the fourth station north to explore the northern portion of the mine, the proposed drift to run north-east.

**CHOLLAR-POTOSI**—has been in marked favor since our last reference, opening at \$345, advancing to \$394, then selling at \$375, under a large sale improving to \$400, and closing at \$400. It is said that the Blue Wing station is producing the usual quantity of ore. The winze from the Santa Fé station is down forty-eight feet, and is reported to be in as good ore as is obtained in the level above. The first station of the new shaft is yielding about fifty tons of ore per day. The surveyor of this company, Richard H. Stotch, makes the following estimate of ore in the mine: Above the tunnel level, 5,000 tons; between tunnel level and Santa Fé station, 150 feet long by 110 feet deep and 35 feet wide, 48,000 tons—already extracted, 3,500 tons, and allowing 11,100 tons (25 per cent.) for waste, leaves 33,400 tons; below the Santa Fé, say 150 feet long, averaging 20 feet wide and 50 feet down, and supposing the bonanza to taper out in depth, 10,000 tons; first station (new shaft) stope, supposing stope to continue up four sets, 1,078 tons; and below the first station and above Peck drift, say 70 feet down, 10 wide, and 40 long, 2,500 tons, making a total of 51,978 tons. During the week ending April 13th, 1,686 tons of ore were sent to the custom mills; previous week, 1,481 tons.

**IMPERIAL**—has fluctuated but little, selling at \$265@270, and closing at \$277. The first clean-up of this company during the current month, produced about \$20,000 in bullion. They are now hauling from 120 to 140 tons of ore per day to the Rock Point mill. The Imperial-Empire shaft is now timbered 861 feet, with but little water at that depth.

**OPHIR**—sold to a considerable extent, rapidly advancing from \$290 to \$355, falling to \$290, then selling at \$320@345, and closing at \$346. The south drift on the tenth station is in 68 feet. The difficulty this company, as well as most others, had to contend with lately, was the limited supply of wood, but we understand that an adequate amount is now on hand.

**ALPHA**—sold at \$205@310.... **BELCHER** receded from \$190 to \$162.50, then sold at \$190, and closed at \$205.... **EMPIRE** varied little from \$170, closing at \$175.... **CONFIDENCE** sold at \$36@41, closing at \$36.50.... **GOLD HILL Q. M. & M. Co.**, recently placed on the list, sold at \$200@197.50 per share.

The aggregate sales of stocks, Legal Tender Notes, etc., since Saturday last, amounted to \$1,525,752.

**THE RAILROAD CONSTRUCTOR.**—The Humboldt Register enters its protest against the claim made by some of the California journals, that this is a California invention; and declares that the honor belongs to Nevada in general, and Star City, Humboldt county, in particular, Mr. Robertson having been a resident of that place at the time the machine was projected. We are willing to divide the glory between the two States.

**LLOYD & STEWART'S ANCHOR—FAVORABLE TESTIMONY.**—S. C. Nathan, one of our San Francisco pilots, makes oath before a Notary that he has tried this anchor in such places and under such circumstances, as to be satisfied that it has no equal. He recommends masters and owners of vessels to adopt it.

## New Incorporations.

April 17th.—Cambridge Mining Company: Lode near Grass Valley. Capital stock \$250,000; divided into \$1,000 shares. Trustees: D. W. C. Rice, Wm. Blanning, W. H. V. Cronise, W. E. Dean, Milton Bulkley, and W. B. Cummings.

April 13th.—Potrero Company: To establish a manufactory for oils and other chemicals. Capital stock, \$40,000, in 800 shares of \$50. Trustees: M. Burkhardt, M. M. Estee, James L. Beyea, Henry K. Goddard, and A. D. Piper.

**THE QUICKSILVER MINING COMPANY.**—We have received a copy of the annual report of this company. The pamphlet contains the President's report to the stockholders, at the annual meeting in Philadelphia, February 27th, and also that of the superintendent of the mine (New Almaden) to the President. The condition of the company is stated to be better than at any previous period, notwithstanding the low price of quicksilver, due to increased production without a corresponding increase in demand. The total world's production for 1866, was, in round numbers, 85,000 flasks. Of this, 33,000 was from this mine.

**A YOUTH'S HISTORY OF CALIFORNIA.**—A. Roman & Co., the publishers of this work, have sent us a copy. It is a neat 12mo. of 187 pages. Heretofore, "Notes" of sometimes questionable authority, and "Annals" of formidable dimensions, have furnished the California school-boy with the only means of an acquaintance with the history of his own State. This little volume commends itself as giving the salient points in such history, in concise and attractive form; and its perusal would do no harm to many a San Franciscan of larger growth.

**AN INTERESTING MAP.**—We have seen a proof sheet of the map of Sierra county, now being prepared by Messrs. Crossman & Cochrane. Besides everything else which one would expect to find on such a map, it delineates the course of the ancient river channels, so far as they have been defined. Crossing as they do, the present river channels, these beds of aniferous cement and gravel are especially interesting to the miner and the geologist.

**ARTIFICIAL ICE.**—Mr. W. R. Frink has exhibited to us a sample of ice made by him from Spring Valley water. This ice was made by a machine manufactured in this city, under his direction, and the first work of the kind done on this coast. The machine weighs only about eighty pounds, and is capable of producing twelve pounds of ice at one heat—heating is the proper term to use, although freezing is the result. We shall give a more extended notice of the process and machine next week.

**UNITED STATES DEPUTY SURVEYOR FOR DISTRICT No. 9.**—Rudolph D. Henreus has been appointed U. S. Deputy Surveyor for the counties of Kern, Tulare, San Diego, Los Angeles and San Bernardino—constituting mineral district No. 9.

**PALMER'S PATENT ARTIFICIAL LEG** is said to be the best in the world. Jarvis Jewett is the agent, at 629 Washington street, San Francisco.

## MINING SHAREHOLDERS' DIRECTORY.

[Compiled for every issue, from advertisements in the MINING AND SCIENTIFIC PRESS and other San Francisco Journals.]

Comprising the Names of Companies, District or County of Location; Amount and date of Assessment; Date of Meeting; Day of Delinquent Sale; and Amount and Time of Payment of Dividends.

## BLAKE'S PATENT

## QUARTZ CRUSHER.

CAUTION!

The owners of the Patent for this valuable machine, in order to facilitate the protection of their rights against numerous infringers, procured, some time since, a reissue of the Patent, bearing date January 9th, 1866.

This Patent secures the exclusive right to employ in Stone-Breaking Machines Up-right Convergent Jaws, actuated by a Revolving Shaft.

All persons who are violating the Patent by the unauthorized making, selling or using machines in which quartz or other materials is crushed between upright convergent jaws, actuated by a revolving shaft, are hereby warned that they are appropriating the property of others, and that they will be held responsible in law and in damages.

Several infringing machines are made and offered for sale in this city, upon which Patents have been obtained. Manufacturers, purchasers and users, are notified that such Patents do not authorize the use of the original invention, and that such machines cannot be used without incurring liability for damages.

BLAKE & TYLER,

14v14t Agents for the Pacific Coast.

## TO VICTIMS OF RHEUMATISM IN

## RICHARDS' REMEDY!

For Inflammatory, Chronic, Hereditary and Mercurial Rheumatism, Rheumatic Gout, Lumbago, Sciatica, and all the modifications of the disease, whether confined to one or more joints, or system or errant in their character. Composed wholly of VEGETABLE EXTRACTS, it exterminates the complaint without injuring the constitution. None but the PUREST SUBSTANCES have been selected for its preparation, and its use is attended with no danger, and no return to the pain and debility of the patient, and once cured, nothing but the grossest imprudence can lead to a relapse. The confidence with which these statements are made to the public, is the result of many years of observation and experience. The reputation of mere palliatives soon dies out, but that of a STERILIZING MEDICINE, which produces, year after year, in all cases, the same beneficial effects, NEVER DIES. This has been the history of Richards' Remedy. Try it!

Richards' Remedy is for sale by

H. BOWMAN, Druggist, Sacramento,

And by Druggists generally.

## Mineral Land Law Blanks FOR SALE.

We are prepared to furnish any of the following blanks used in securing patents for lands under the National Mineral Land Act of 1866:

I. Applicants' Declaratory Statement.

II. Diagram, Description of Diagram and Bondsaries, and Notice.

III. Register's Order for Publication—with Notice.

IV. Deposition that Notice has been Posted.

V. Application for Survey Etc.

Prices.—Single blanks, 10 cents; 75 cts per dozen; \$4 per hundred—postage paid.

Pamphlet containing the Law and the Instructions of the General Land Commissioner, post paid, 25 cts. Address DEWEY & CO., Mining and Scientific Press, San Francisco.

## Valuable Books on Mining, Mineralogy, Geology, Metallurgy, Etc.

ANSTED'S Gold Seekers Manual. 1 vol. 12mo. cloth. \$1 75

ANTISELL.—The Manufacture of Photogenic or Hydro-Carbon Oils, from Coal and other Bituminous Substances, capable of supplying Burning Fluids. By Thomas

## Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

## CALIFORNIA.

## Alpine County.

From the *Miner* of April 6th: Two assays made of the decomposed substance struck in the Tarshish early this week, after careful averaging the samples, gave as follows: No. 1, weight of silver per ton, 513.2 ozs., value \$667.16; weight of gold per ton, 3.5 ozs., value \$72.34; total value per ton, 739.50. No. 2, weight of silver per ton, 463.3 ozs., value \$597.87; gold 3.4 ozs., value \$70.27; total value per ton, \$668.14. The vein is at least three ft., and not yet pierced through. Twenty-five sacks, weighing over a ton, of ore equally good with the above samples, was taken out of a hole not one-fourth the size of the tunnel. Five tons will be taken to Washoe for reduction as soon as the state of the roads will permit. The work of extraction will meanwhile go on.

All the ground for a mile each way on the Tarshish, not previously claimed, has been located. The croppings are easily distinguished from any other. This strike will give a new impetus to operations here.

The American is preparing for work.

From the *Silver Mountain Bulletin* of April 6th: In the Mountain tunnel, 22 ft. has been made in the two weeks preceding March 30th, and the favorable appearance of the rock gives promise of 14 ft. per week in future. Nitro-glycerine will be used as soon as it can be obtained.

## Amador County.

It is stated, and we have no good reason to doubt the statement, that the suspension of Meader & Co. is only temporary. The Newton and Pioneer mines have not ceased operations in consequence of the reported failure; the hands have been paid in part, and are content to trust the company further.

## Butte County.

From the *Oroville Record* of April 13th: The ground upon which Bidwell's Bar, the well known '49 camp stood, is to be mined out.

The extensive beds, or rather mountains of cement in this county, and which, with the imperfect methods of saving the gold, have heretofore proven remunerative, must soon become more valuable than ever, if worked by the chlorination process. Preparations are being made to test them, at various points, and we hope soon to hear of successful results.

The Marysville *Appeal* has seen rich samples of blue cement gravel from the Bangor blue gravel range. Shafts were commenced on this range years ago and abandoned. Some months ago the work of prospecting was renewed. Two shafts are now down 60 ft., two more going down, and the range located for three miles.

## El Dorado County.

From the *Placerville Democrat* of April 13th: The claim of Mr. Shepherd, at Poverty Point, within a mile of this city, is one of the richest in the State. A few weeks ago, in about 20 minutes, he took out specimens valued at \$1,100. On Monday last he brought to our office a number of rich specimens, taken out the same day, from the same claim, varying from two to six inches in length, literally covered with gold.

## Inyo County.

The Gold Hill *News* has seen Mr. Marshall, just from Kearsarge. He states that the country is the roughest of the whole Sierra range. The ore from the best mines will work in the mills from \$200 to \$900 per ton. The ground is covered with float rock, some of which he had worked and realized over \$500 per ton, or in that proportion.

From the *Visalia Delta* of April 10th: We learn from Capt. A. B. Paul that several heavy companies will be operating in this district during the coming summer.

Rock from the Kearsarge mines, worked by furnace, pays \$720 per ton. Silver Sprout Co. sold their mines to a San Francisco Co. for a large sum of money. The mines on Lone Pine, worked chiefly by Mexicans with small furnaces, are turning out a great deal of bullion. There are many arastras and small mills running there.

## Mariposa County.

From the *Gazette* of April 13th: Letter from Coulterville: H. H. Sheldon has taken charge of the French Co's mine and mill for a San Francisco Co., and has commenced work in earnest. \* \* L. Cunningham and N. G. Hideley have started their new mill of four stamps on their tale vein on Black Hill. All appearances would indicate that they will do well. A. G. Black's mill on Bull Creek, is now running on rock from a vein of recent discovery. The vein is very large and the ore good.

## Nevada County.

From the *Transcript* of April 11th: Some excellent rock is being obtained from the Oriental mine, on Deer Creek.

Same of 16th: We were shown yesterday a rich specimen of quartz from the Birchville ledge, near Eureka. It was thickly covered with particles of free gold. A mortar test of this rock paid at the rate of \$500 per ton.

Same of 17th: At Flat Creek, the tunnel of Dillon, Stiles & Co. is in 175 ft., and McGuire & Co. have run 300 ft. since last fall. The former company expect to strike the channel before summer, and the latter company will suspend work for the purpose of working in the hydraulic claims until the water becomes scarce.

From the *Gazette* of April 13th: Fifty-eight tons of rock from the Noramhagua mine, crushed this week, yielded \$5,100—an average of \$88 a ton.

Same of 16th: The Badger Co., on Manzanita Hill, is in bad luck. Three weeks ago the bank at the mouth of their tunnel caved in, stopping it up and backing up the water, which breaking through, swept everything into the river, damaging the company to the amount of \$3,000. They had hardly repaired the damage, when their flume was blown down, delaying their work, and putting them to further expense.

From the *Grass Valley National*: The Phoenix mine, owned by Messrs. Hennessy, Galloway and others, at the present depth, 50 ft., looks well. The Phoenix was worked years ago to a depth of 35 ft., at which point quartz was taken out which yielded \$25 to a ton.

From the *Grass Valley Union* of April 14th: The York Hill Co. will commence crushing at the Rocky Bar mill on Monday next. The third level is now being opened, and the mine will soon be in such a condition that 500 loads of rock can be taken out monthly.

## Plumas County.

From the *National* of April 6th: We learn that the new mill of Messrs. Light & Bro., at Genesee Valley, has been raised, and that the machinery will be put in as fast as possible. They have plenty of quartz ready for crushing as soon as the mill is completed.

Operations have been stopped at the old Round Valley mill, and the new one will be put in running order in about six weeks.

The mines upon the East Branch, at Twelve-Mile Bar, Rich Gulch, and Rush Creek Flat, are reported to be paying well. Messrs. Hyde & Ward have obtained as high as fifty dollars to the pan.

From the *Quincy Union* of same date: Hallsted & Co., near Twelve-Mile Bar, took out \$500 from their claims for two weeks panning. Hyde & Ward have commenced work near Twelve-Mile Bar, in what is known as "The Slide." They struck the Ohio Point lead, and have taken out as high as \$50 to the pan. Their old claim, opposite the bar, which paid them \$8 per day to the hand, is lying idle. On Rich Gulch, the miners are busily at work, with good prospects. A short time since C. Hallsted struck a quartz lead on Ohio Point, which prospects well. Messrs. Smith & Co., and Lew Sanders have struck rich diggings in Tadpole Ravine, near the head of Soda Creek, and are taking out big pay.

Bachellor & Co. are taking out rock from the Caledonia ledge, at Cherokee, which is paying \$18 per ton. Blood's mill, near Greenville, is said to be paying better than any of the mills in that vicinity.

The report that the Cosmopolitan Company had struck the main ledge was premature. The Company's tunnel is 375 feet in length. They are now working in comparatively soft rock.

## Placer County.

From the *Herald* of April 13th: The Daventport Co. have now got their shaft down 100 ft., and in a few days will drift for the ledge.

Mr. Lowry has recently struck it very rich in the Green Emigrant claim. As high as \$150 to the pan has been washed out after the quartz was pounded in a mortar.

On the Black ledge, south of the Green Emigrant, parties are now at work and are getting very rich prospects.

The Golden Rule Co., near Horse Shoe Bar, have decided to erect a 20-stamp mill. They have been hauling their rock three miles to Stewart's Flat mill for a year, and have thoroughly tested it.

From the *Stars and Stripes* of April 3d: The following Gold Run items are from a correspondent: O. Harkness' claim has yielded this season, for 73 days' run, \$11,850. Wolcott & Prindle cleaned up last week, and found \$2,564.47. Messrs. Stewart & Prindle, after a run of 15½ days, cleaned up \$1,047. The Uncle Abe Co's claim, owned by Messrs. Upton & Platt, and opened this spring, have made two runs—the first paying \$80 per day, and the second, after 16 days' washing

with 275 inches of water and three men, \$1,600. The Gold Run claim, owned by Messrs. Kinder & Stewart, cleaned up \$1,800 after 13 days' run. Messrs. Brogan, Johnson & Wentworth made a partial clean-up after a run of 20 days, and found \$2,500 in their boxes. Messrs. Hnyck & Judd have made a partial clean-up, which gave them \$2,000. Messrs. J. B. Taylor & Co. cleaned up, after a run of 20 days with 275 inches of water, and got \$4,569.

Colfax letter to Dutch Flat *Enquirer* of April 17th gives these items: John Frazier, near Kilmer's, has worked steadily during the rain, and has averaged over \$30 per day. Jess. Douglass has also been doing well, making from \$6 to \$10. Walker & Co. are now sluicing up the ground they have heretofore ground-slucied, and are making \$20 to the man, working six men.

## Shasta County.

From the *Courier* of April 13th: The South Fork mines continue to attract more and more attention. Two towns, Ellsworth and Lewiston, have been laid out. Work is being prosecuted on the Chicago, Crystal, Pacific and Ohio, and operations will be commenced on three or four other lodes next week. A number of Red Bluff people talk of going there as soon as spring opens.

Jollie & Dosh have leased Kelley & Co's mill, and are making a run on rock from the ledge at Muletown. The rock assays well, but is difficult to work.

Mr. Banghart, on Mad Mule Creek, while drifting on his vein last week, struck a very rich pocket. We were shown some specimens last Saturday, one of which weighed 5½ ozs., containing at least three ozs. of pure gold.

Larkin & Harris are opening what is supposed to be one of the richest claims ever worked on Roaring River. The ground is extensive enough to last for years.

The Red Bluff *Sentinel* says of the Clear Creek mines: Recent assays from the most reliable offices at San Francisco, prove, beyond doubt, that the ore is exceedingly rich, yielding as high as \$937 to the ton. Our town is nearly depopulated by the exodus of its citizens thitherward. Already several rich claims have been sold at high figures, although there is plenty of ground yet unoccupied.

We learn that five tons of Clear Creek ore has been shipped to Europe for reduction.

## Sierra County.

From the *Messenger* of April 13th: Near Kanaka City, South Fork of Kanaka Creek, John Fessler has discovered a ledge of talcose blende rock, containing a large proportion of gold, from which several thousand dollars have already been taken.

Hell Roaring, or Exchange Mining Co. at Minnesota, is reported to be paying largely of late. A piece of gold weighing about 40 ozs. was lately taken out.

The Fremont Co., at Wet Ravine, have commenced breasting. They have very flattering prospects. The Packer Co., at Smith's Flat, are taking out \$5 per day to the hand. The Oak Flat Quartz Co. are taking out richer ore than ever before.

Howland Flat letter to same says: The Monumental Co., which have lately struck into gravel, is getting most excellent prospects. To supply air they are now raising a shaft to the surface.

The Hawkeye Co. are getting very good pay in a very peculiar kind of dirt that lies high up on the outer rim of the channel.

The Pittsburg are running their tunnel for the back channel with good indications.

From the Union, Down East, Shirley, Mountaineer, French and Lone Star Co's, I hear good reports.

Work in the Union mine has been much retarded this winter by scarcity of water for hoisting purposes.

The *Advocate* of April 13th says: A company of Frenchmen found a nugget, last Monday, weighing a little over 22 ozs., in their claims just below the Cascades saw-mill, on the Middle Fork.

A letter to the *Alta* from Howland Flat gives these items: All the "Flat" claims are exhausted, except the Mountaineer, Shirley and St. Louis. Of the "Hill" claims, the present annual aggregate yield of the Pittsburg, Hawkeye, Down East and Union, is about \$350,000. The mines of Howland Flat are all tunnel mines, and are usually worked day and night. Water is plentiful the year round, this class of mining requiring but little water. The gravel is simply washed in ordinary sluices from 600 to 1,200 ft. in length, no mills being used, although considerable cement is sometimes encountered, but hardly in sufficient quantity to justify the expense of stamping or crushing it.

## Tuolumne County.

From the *Columbia Citizen* of April 13th: Rowell, Whiting & Co's claim at Sawmill Flat, yielded an ounce per day to the share at the last clean up this week.

John Adair, who has been visiting the Tuolumne county mines, says of the Raw Hide claim, that the shaft is 240 feet in depth, showing a vein eleven feet in width, and increasing in richness with the depth. App & Co's vein is twelve feet wide at the depth of 250 feet.

## Yuba County.

The Bateman ledge, at Dobbins' Ranch, is 20 inches thick on an average, and prospects well. The Grass Valley *National* learns that from a crushing of 53 tons, made at the Templar mill No. 2, at Indiana Ranch, \$25 per ton was realized. About 500 tons of pay rock is now in sight. The company own 1,600 ft. An eight-stamp mill is to be working within 60 days, on the rock taken from the ledge.

## ARIZONA.

A letter to the *Alta* from Aubrey City, March 25th, gives these items: Mr. Thompson brought down samples of ore from the Great Central mine, which has been found to yield 74 per cent. copper. It is said to be the richest ore ever discovered here. The men in the Great Central broke down over 100 tons of ore last week in three days, which will average 30 per cent. The company will have their new furnace running within the next 10 days, if the weather permits. They will also ship a lot of the high grade ores in bulk as soon as the Fork subsides, so that the teams can haul it down to the river.

## BRITISH COLUMBIA.

A letter to the *Walla Walla Statesman*, from Colville, March 14th, says: We have just received news from the newly discovered gold fields '49, about 20 miles from the mouth of the Kootenai, which is highly favorable. The discovery party, H. H. Oliver & Co., have commenced work, although greatly hindered by the cold, and are taking out good wages. Messrs. Dupee & Co., who have located claims above and below the Discovery, have prospected their ground, and have taken out as much as two ozs. of gold to the panful of gravel. The creek is about 20 miles long, and quite shallow; the bedrock can be reached at from six to 12 ft. Besides '49, there were two more creeks discovered last fall, a short distance from that place, and from prospects they seem fully as good as the '49. There is a report current that the steamer *Forty-nine* will leave the Little Dalles about the middle of April or first of May, for the above mines and the Big Bend country."

## COLORADO.

From the *Times* of March 26th: Last week, Mr. Mitchell, of the Alps Co., took out 102 ozs. with his 12-stamper. The Black Hawk Co's run was 240 ozs. The Smith & Parmelee mill was running only a short time, and cleaned up 60 ozs.

The Montanamil, in Spring Gulch, started up to-day.

This morning we were shown a chunk of rock from the Georgetown silver ledges, which, after being heated in a stove, showed pearly globules of silver all over it.

From two cords of quartz rock, taken (at a depth of 140 ft.) out of claim No. 1, east on the Gunnell lode, Eureka Dist., Mr. John Mendel saved 32 ozs., 2 pwt., equal to \$674. This was done in his 12-stamp mill.

The Gunnell yielded 138 ozs. this week, less than it would have done on account of repairs, etc.... The Briggs yielded 162 ozs.

From the *Denver News* of March 27th: On the Missouri lode at Jamestown, a shaft is down 22 ft., with four-ft. crevice. Judge Dickerson's quartz mill will soon be ready to start.

From the *Register*: From all quarters the most encouraging intelligence reaches us of active and extensive mining operations to be inaugurated this spring and summer. Old and long idle mills are to be repaired and put in running order. Others are to be built in various quarters. Smelting works and desulphurizers on approved plans are to be put up in our own and Clear Creek counties.

Work on the Canandaigua lode has progressed all winter, and is now down 80 ft., with excellent prospects.

## IDAHO.

From the *World* of March 30th: The prospect for a good mining season is favorable. On the west side of Elk Creek, on the bar, and along Slaughter House Gulch, there are a number of miners constantly employed, all making from good to first-rate wages, and as soon as the ditches can be safely started, a great amount of work will be commenced upon.

Good reports come from the Elk Horn Quartz mine. In piercing the lower tunnel the ledge has been struck at a depth of 400 ft. It is very rich, and averages about 2½ ft. in width. The company have already taken out over 600 tons of rich ore from the upper tunnel, and will soon commence crushing.

From the *Lewiston Journal* of March 22d: Florence, Warren's, and Elk City will be largely worked this season. At the latter place one or two mills will be built. Oro Fino will employ about 1,000 Chinese. The Palouse mines and Gnat Creek mines will employ some 200 or 300 men at fair wages during the early part of the season.

Kootenai will also produce considerable gold which will drift in this direction. So with Blackfoot and Lemhi.

Altogether, the prospects are more favorable than at any time before since 1862, when Florence was in its glory.

Mr. Hunt, express messenger, reports the snow seven ft. deep in Warren's Basin, and the miners impatient for spring. Provisions were abundant. The cold has interrupted to some extent the work on the ditches and flumes along Salmon river, although the work is progressing. Mining for the two weeks past on the river has been somewhat checked by the cold, though never entirely suspended. The work on the Little & Harpster tunnel is suspended, owing to some misunderstanding between the contractors and superintendent.

Express from Oro Fino says most of the miners have abandoned the town site and now occupy Pierce City.

The *Alt* has a letter from Silver City, Idaho, dated March 25th, with these items: Capt. Pierce, with 16 men, left the other day for the head waters of the Owyhee River, on a prospecting trip to the Red Mountains, 100 miles south of this place.

All the placer claims of Jordan Creek have passed into Chinese hands.

Only the Fagus, of the 12 quartz mills in this county, is now running.

From the *Oregon Herald* of April 6th: Mr. Richard Brady, of Placerville, has just returned from Lemhi, where he spent the fall and winter. He reports 12 to 15 mining camps as having been struck around Fort Lemhi. In all of them "wages prospects" could be found, but nothing of larger promise. The diggings are extensive, and the gold is diffused through the earth from within a foot of the surface to the bedrock, which is from 8 to 26 ft. deep. Water is readily attainable. The distance to the mines from Boise City is about 350 to 400 miles. The roads in that direction are good. One-half of the population of the Boise Basin are talking of putting out for Lemhi as soon as spring fairly opens.

#### OREGON.

From the *Oregonian*: We have a letter from Auburn which states that the new mines, 70 miles south of that place, are very extensive. Prospectors have struck a creek at a place where immigrants crossed it at an early day, and find considerable quantities of gold. One man took out \$600 in 13 days. It may be that this is one of the places where the immigrants, who came by "Meek's cut-off," discovered the gold of which everybody has heard so often.

Elk Creek Dist., in the John Day country, is one of the richest quartz mining localities in Oregon. Some of the rock from that district shows \$270 per ton of gold.

The *Umatilla Press* says that the Lawrence Bros. have discovered a silver lode on their ranch on Butter Creek, in this county. Ore therefrom has been sent to Portland for assay.

The *Jacksonville Sentinel* says the tunneling in Gold Hill is still progressing, with good prospects of success. The ledge has been struck again, and the miners are running a shaft from the tunnel to the surface—a distance of 120 ft.

#### MONTANA.

From the *Post* of March 30th: Hendry's mill cleaned up on last Saturday, from an eight day's run on Whitlatch Union ore, with 18 stamps, 324 ozs. of retort, valued at \$5,832.

Prof. Charles Rumley assayed some ore from the Copperopolis lode, Muscleshell Dist., which yielded 41½ per cent. pure copper.

Mr. Pfel has organized a company in St. Joseph, Mo., with a capital of \$100,000 to put a mill on the Alameda lode. Mr. Isaacs, agent for a New York company, has also purchased two mills, one for the Summit Dist. and another to work on the Alameda.

The St. Louis and Montana smelting works yesterday cupelled the largest silver brick which has yet been produced. It is circular in form, 28 in. in diameter, 1½ in. thick, and weighs 120 lbs. This splendid piece of silver is the product of 7½ tons of ore from the Legal Tender lode. Notwithstanding the many adverse circumstances against which he had to contend, such as poor coal, the extreme cold, etc., Mr. Philip Deidesheimer has so altered and improved the works that they may now be pronounced a complete success.

Letter to same from Atlantic City, Lost Horse Gulch, says: That new camp—Eagle Gulch—is prospecting even better than at

first reported. Several parties from this gulch have gone there and are taking out pay dirt, and getting ready for sluicing as soon as water can be obtained.

Letter from Highland Dist.: The thermometer was 40° below zero, on the morning of the 12th. Mining operations were resumed on the 18th. Yesterday, Myers and Longloy discovered a ledge that bids fair to eclipse anything in this section. George Searl is making arrangements to develop the Reward ledge. Butter and others are sinking a shaft on the Mount Ceniz, a new discovery. The Golconda have their tunnel in 132 ft.

Letter from Blackfoot: Thermometer 34° below zero on the 13th. As soon as the weather will permit, work will be commenced in earnest, and the bar below town will be swarming with men. Washington, Lincoln, Jefferson, McClellan, California and Nevada companies are putting up hydraulic works on bars in the foothills.

Letter from Summit: The Boardman tunnel is in 213 ft., and will tap the Kearsarge 225 ft. below the surface. The Keystone has a shaft 60 ft., and ore from it has paid \$40 per ton. The Excelsior resumed operations on the John How lode to-day, by starting a tunnel. It will be six and a half feet high by six feet wide, and 400 ft. in length; it will tap the lode 300 ft. below the surface. Duncan and Connyman have purchased 800 ft. on the Nelson. The shaft is now 70 ft. The Christnought Co. are working at a depth of 80 ft. in discovery and 50 ft. in No. 2. The ore is very rich, paying \$100 per ton. The new mill will cost \$150,000. The total yield of seven runs on Kearsarge ore, at the Hawkeye mill, between Jan. 7th and March 17th, was \$23,016.64, and crushed 771 tons. Twenty-eight hundred pounds of rock from the Black lode, in Brown's gulch, cleaned up \$24.

Helena items: The Turnley 10-stamp mill in Grizzly Gulch, cleaned up 266 ounces (\$4,788) of amalgam, last week, with some more to come down. The mill was crushing Whitlatch Union ore, and the above was the result of one week's run.

A 20-stamp mill is to be located at the head of Ten Mile Creek, ten miles from Helena. Besides the stamps, it will have Moore crushers, Varney pans, and amalgamating tubs.

#### NEVADA.

##### Esmeralda.

From the *Aurora Union* of April 6th: Over three tons of bullion from the Cornucopia mine, Partwick, are lying in Wells, Fargo & Co's office, in this place, waiting for shipment. Over 150 lbs. of bullion from the Diana has been shipped within the past week and plenty more at the mine waiting transportation; also \$3,500 worth of bullion has been shipped from Aurora in the meantime.

##### Humboldt.

From the *Register* of April 6th: M. Torrey is progressing finely with his mining operations. He has one large furnace, superior to anything of the kind in the State, nearly completed, and is getting everything else in good shape. His mines in Arabia are turning out to be all he could hope. He has ore now piled up on his dumps of the value of \$80,000 at the lowest estimate. Yesterday he commenced hauling this ore to his reduction works.

##### Reese River.

From the *Reveille* of April 6th: Yesterday there were brought into town from the Knickerbocker mill, near Ione, 1,156 ozs. of bullion.

In the Reville Dist. prospects are reported flattering. Several owners of mines are engaged in getting out ore for the Rutland mill. The Crescent, Mediterranean and Atlantic, of the Reville company, are yielding abundantly of ore that would work from \$100 to \$150 per ton.

Same of 8th: The Hopkins tunnel, which is to the rich belt through Lander Hill what the Suto tunnel is to the Comstock lode, is now in nearly 400 ft. It is the property of the Revenue Extension Co.

As wonderful as is the general character of the ore yielded by the Highbridge, it appears to improve and increase in richness as depth is attained. We were shown this morning a very beautiful specimen of mineral from the shaft of the Combination Co., at the depth of 170 ft. The piece is purplish black, and of remarkable gravity, and masses of it have returned \$10,000 of silver per ton. As rich as the mineral is, it is the predominant one in the Silver Bend and the Empire districts.

Same of 9th: Eleven bars of bullion were brought into town to-day from the mill of the Twin River Co. Yesterday, 2,713 ozs. of crude bullion came in from the mill of the Social and Steptoe Co. at Egan Cañon.

The Keystone mill, which commenced running on Feb. 5th, continued without interruption for 50 days, during which time it reduced 543 tons of ore, yielding on an

average \$262 per ton. The ore was in some 50 different lots.

The Manhattan shipped 56 bars on the 9th inst., valued at \$56,613. They were the product of 319 tons of North Star ore.

Same of 10th: In Newark Dist., 85 miles east of Austin, work is progressing on the mill of the Centenary Co. The Chihuahua, one of the mines belonging to the Co. has a 10-ft. vein on the top. A tunnel is now in 60 ft. Two hundred tons of ore now lying in the dump is estimated to be worth \$200 per ton.

The California mill is at work again.

Same of 11th: The Knickerbocker mill, near Ione, is working custom ore. The upper tunnel in the Great Eastern is progressing.

Same of 12th: The Gilligan vein, of the Social and Steptoe Co., in Egan Cañon, bids fair to be a splendid mine. We are informed that in the level from which ore is being extracted, the vein is 5½ feet, and two men in the day shift are able to supply the five-stamp mill with its full complement of ore.

Four bars of bullion came in last night from the Belmont Co's mill.

From the *Silver Bend Reporter* of April 6th: J. W. Gashwiler, M. J. McDonald and S. M. Buck, last week, purchased the entire mining interests of Col. D. E. Buel, in the Highbridge, Transylvania and El Dorado ledges. The new company will be called the Belmont Co. They will at once erect furnaces and other improvements, and preparations will be made for working upon an extensive scale.

The Kentucky, 90 miles S. W. from Belmont, is the representative mine of Palmetto Dist., as is the Highbridge of Philadelphia Dist. It is 1,600 ft. in length, and is owned principally by W. H. Bunyard. A perpendicular shaft recently sunk strikes the vein at the depth of 61 ft. The rock is rich—the entire mass, nine ft. thick, is estimated to be worth \$100 per ton.

Thos. Cahill, a day or two since, assayed a piece of the ore lately struck in the Combination company's claim upon the Highbridge, and it produced at the rate of \$10,247.79 per ton. The body of ore from which this piece was taken is about 13 ft. thick, and it is the opinion of Mr. Cahill that a considerable portion of it will work at the mill near \$5,000 per ton. A 40-stamp mill is to be erected at once.

The Rutland mill is 60 miles southeast of Belmont. It has five stamps of 600 lbs., and three of Wheeler's improved pans. It was to be set in motion on the 10th inst. Roasting furnaces are to be erected as soon as the weather becomes settled; meanwhile the wet crushing will be tried. The ore now on hand is from the Mediterranean, Crescent and Atlantic, and is estimated at an average of \$100 per ton. Some good ore has also been taken from the Mohaska ledge.

##### Washoe.

[In the Stock Circular, in another portion of this paper, will be found late mining news from this district.]

From the *Territorial Enterprise* of April 8th: Everything in the cañon below Gold Hill is lively. All the mills are pounding away on full supplies of ore. At this time, the price of reducing ore to within a certain per cent. of the assay is \$15 per ton.

Same of 9th: The new shaft of the Imperial and Empire companies, being worked conjointly, is now 850 ft. deep. New and substantial hoisting works of the most powerful description will be erected, the grading for which will commence in a day or two.

The amount for which Col. Buel's property changed hands, is variously estimated at from \$160,000 to \$300,000 in gold coin.

A body of very rich ore, five feet thick, was struck on Saturday last at the 500-ft. level of the Crown Point mine, in the front ledge. Considerable excitement was created by this new development, which promises to be an extensive one.

The Bowers and Plato has stopped hoisting ore for a few days, to put in a new reel, and make other improvements. When the works again start they will be able to hoist about 150 tons of ore every 24 hours.

From same of 12th: The new and powerful hoisting works of the Empire and Imperial will be in running order by Aug. 1st. The eight-inch pump, running at the rate of eight strokes or revolutions per minute, is only able to keep the body of water recently struck in the Crown Point mine at a stand-still, and prevent its rising to the 500-ft. level, where the late rich strike of ore was made.

Same of 13th: The following is a statement of the amount of bullion shipped during the past week: From the office of Wells, Fargo & Co., in this city, there were shipped 4,347 lbs. of assayed bullion, valued at \$174,872.87; from their office in Gold Hill, 2,539 lbs., valued at \$69,761.61.

From the *Trepass* of April 9th: The ledge

in the Crown Point mine, where the rich strike was made, is five ft. wide. A miner, who was working in the drift when the ledge was cut, rushed to a broker's office as soon as he could get out of the mine, and bought one foot of ground at \$800. Yesterday the stock went up to \$1,400.

The Savage company will supply, besides their own mill, the New York mill with ore during the coming months, and the Hale & Norcross will furnish ore to the Manhattan mill.

Same of 10th: The Comet mill is now at work on Challenge ore.

Same of 11th: The new machinery of the Empire and Imperial, now on the ground, is as follows: Two double reversing engines, each of 80-horse power capacity, the steam to run the same to be generated from six boilers, each 50 inches in diameter, containing 50 three-inch tubes. The drainage engine is of 300-horse power, direct connection style, 42 inches diameter of cylinder, and 11-ft. stroke of piston-rod. The hoiler is 30 ft. in length, and contains 180 three-inch tubes.

Same of 12th—letter from Silver Bend: The Transylvania No. 1, parallel with the Highbridge, has been opened by inclines at four different points, and shows the same mineral in all, improving with depth. Ore from the surface pays by mill process \$300 per ton. Four tons from the Arizona paid \$900 in an anstra, worked by Martin & Borquers. The West Port, eight miles west of the Highbridge, assays \$3,000 per ton. The Phantom, \$1,800 per ton. The Silver Cord, \$2,100.

Same of 13th: In the Ophir, the drifts at the 8th and 10th levels are being pushed forward, and the indications are more favorable than for some time past. In the Gould & Curry, prospecting is being done at the Bonner shaft, and the mill will commence work on foreign ore. From the Savage, over 300 tons of ore are being shipped each day, and the profits of the mine this month will be larger than for some time. Coblar-Potosi is said to look well, and 300 tons of ore are being raised daily, supplying nine mills with ore. During this month at least 8,000 tons of ore will be mined. In the Belcher, prospecting goes on steadily. In the Yellow Jacket, a drift west of the 500 ft. level has cut a streak of rich ore. About 200 tons are shipped daily. In the Overman but little work is being done, except to keep the mine free from water.

From the *Gold Hill News* of April 8th: As soon as the ledge is tapped in the Imperial mine we may look for active operations in all mines from the Bullion to the Yellow Jacket. As the great quantity of water with which they have to contend is what has caused them all to suspend operations in the lower levels, within the next four months there will be more known of the permanency of the Comstock ledge than has ever before been developed.

Same of 9th: The Cressus is preparing for a further development of its claim.

We paid a visit to the Crown Point yesterday. We saw a small pile of ore from the 500-ft. level, not the smallest piece of which but showed black sulphuret of silver; and in many specimens native silver was to be seen. Stock in all the claims in Lower Gold Hill has gone up in consequence of the strike.

Same of 10th: We saw this morning a small bar from Mount Blanc ore worked at Rigby's mill. The bar contained \$41.86—divided as follows: Gold, \$14.94; silver, \$26.92. The silver is .951 fine.

#### WASHINGTON.

The *Lewiston Journal* of March 22d says: We learn by a party just from the Sound, that new discoveries of rich silver quartz were made a few days since on the Skagit river, nearly opposite Port Townsend. The specimens show an abundance of free silver. The party who made the discovery is not anxious to have the facts known, but the news has leaked out, and caused quite a sensation in the towns on the Sound, and parties are daily leaving for the mines.

PURE AIR FOR MINES.—We understand that the first plunger air machine, where the air is first compressed on cold spring water, before entering the lungs, was erected at the Ophir mine, on the Comstock lode—greatly to the health of the miner and profit of the company—by Capt. Wm. Williams, a practical mining engineer, now of this city, whose card appears in another column. This machine forced into the mine 48,324 cubic feet of air to a six-foot stroke, and is so simple in construction as to require only one-half the power of one man to operate it.

## Mining and Scientific Press.

W. B. EWER,.....SENIOR EDITOR.

C. W. M. SMITH,.....W. B. EWER,.....A. T. DEWEY.

DEWEY &amp; CO., Publishers.

OFFICE—No. 505 Clay street, corner of Sansome, 2d floor.

## Terms of Subscription:

One copy, per annum, in advance,.....\$5 00

One copy, six months, in advance,.....3 00

For sale by Carriers and Newsdealers.

**American and Foreign Patents.**—Letters Patent for Inventions can be secured in the United States and foreign countries through the Mining and Scientific Press Patent Agency. We offer applicants reasonable terms, and they can rest assured of a strict compliance with our obligations, and a faithful performance of all contracts. For reference, we will furnish the names of numerous parties for whom we have obtained patents during the past two years.

## Canvassing Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting our Agents in their labors of canvassing, by lending their influence and encouraging favors. We shall send none but worthy men.

Mr. A. C. Knox, is our city soliciting and collecting Agent, and all subscriptions or other favors extended to him, will be duly acknowledged at this office.

SAN FRANCISCO, Jan 11th, 1866.

Mr. L. W. Felton, is an authorized agent for this paper at Portland, Dec. 1, 1866.

Mr. E. L. Smith, is a duly authorized Agent for this paper, February 25, 1867.

Mr. Geo. F. Felt is a duly authorized agent for the Mining and Scientific Press, March 23, 1867.

Mr. J. M. Quay will act as agent for the Mining and Scientific Press from this date, March 23, 1867.

## San Francisco:

Saturday Morning, April 20, 1867.

HAS DONE SOME GOOD ALREADY.—It is said that seven companies have been organized in Elmira, New York, for mining purposes and investment in California. Two gentlemen from that place arrived in this city by the last steamer, who intend to purchase mining property. Similar companies are being formed in other towns. This sudden eye-opening is represented to be due to the report of J. Ross Browne, and with good reason. That preliminary report may be said to be the first paper by means of which the general public have been furnished with information on the subject of our mineral resources in any manner bearing the endorsement of the Government. Necessarily and admittedly imperfect, it is notable as the first of a series which we hope will result in immense benefit to our State. The fact, so often noted by letter-writers, that our California journals are rarely to be found upon the hotel tables in the Atlantic cities, accounts for the ignorance which has there prevailed in regard to us; and it was high time for Government to move in the matter.

THE AUZERAI'S HOUSE, at San José, is the most elegant hotel on the Pacific coast, outside of San Francisco, and receives frequent favorable mention from the citizens of Santa Clara county and its numerous patrons. It contains one hundred and five rooms, all possessing good light and ventilation. The suits embrace large rooms, superbly furnished, commanding fine views of valley and mountain landscapes. Mr. Churchill, who has ever been a respected and popular landlord, opened the house two years ago, furnished completely to suit his taste. He is now improving a fine park adjacent to the hotel, containing flowers, shrubbery, summer-houses, arbors, fountain, aquarium, etc. A more desirable summer resort for city families will be hard to find in this State.

SCIENTIFIC EXCURSION.—The members of the California Academy of Sciences will make another scientific excursion to-day. They will go by the San José railroad to the "Twelve Mile Farm," whence they will proceed to the hills, some two miles to the westward, where there are some interesting fossils to be obtained, and other things which will more particularly interest the naturalists and botanists. The managers of the road have tendered a free pass for the trip.

COMMUNICATIONS RECEIVED.—"Some Facts about the action of Electricity on Metallic Substances," by Edward Pique; "What is a Mining Engineer," by J. S. Phillips, C. E. M., etc.; also, a "Letter from Grass Valley," by "Hermes."

We commence, in the present issue, a very interesting series of letters from A. J. Hawk, on the "Reese River Country and its Mines," which will be continued for several weeks.

## Gas Manufacture—The Ensley Process.

The second act of Omnipotence—that which immediately followed the calling into being of our earth, was the creation of LIGHT. Both revelation and science attest that light was the first material force made manifest in the embryo universe. Light must have been the natural result of the clash of atoms which followed the first act of creation. The daily experience of both social and organic life, declares light to be one of the chief necessities of both animal and vegetable existence.

One-half of all time, upon any given spot of the earth's surface, is devoid of the presence of natural light. It has been ordered, and who can doubt the wisdom thereof, that man, to enjoy the earth, should first subdue it. Our bread is earned by the sweat of the brow; and it is but consistent with the harmony of Divine economy that the production of artificial light should be one of man's first and most earnest endeavors. Such has been the case; and the iron arteries which everywhere thread their underground way along the streets of our principal towns, feeding the brilliant constellations of light which shed their soft influence through our drawing-rooms and along our pathways, when compared with dingy oil-lamps and miserable tallow-dips of past years, full well attest that the rapid strides of modern discovery have not been lagged in this most important field of enterprise and labor.

## THE SOCIAL VALUE OF LIGHT.

In a land like our own where intelligence rules, and where the greatest good of the greatest number is our leading political maxim; where the pleasures of the domestic circle are so universally enjoyed and so highly prized, artificial light should no longer be considered a luxury; it should be regarded as an absolute necessity—an indispensable requirement of existence. Its universal dispensation at the lowest possible cost, should claim our most earnest attention, and should be made a matter of public policy. Next to cheap food, a cheap illumination is a great desideratum for the people, and a boon which every philanthropist should hail as a most valuable attainment. Modern chemistry, as already intimated, has done much in this direction. What it has done, however, appears to have been accomplished almost at a bound, with the first introduction of gas; as but little advance has been made in the science of gas-making since its original introduction. Various other illuminating agents, however, in the way of animal, earth and vegetable oils, have been from time to time devised or discovered; but the gas of to-day is about the same as that first introduced into practical use in 1798, by Mr. Murdoch, at Boulton & Scott's works, at Soho, in the north of England. It was coal gas then—it is coal gas now, with but little difference in quality or manner of manufacture; although the material generally furnished in the United States is somewhat better than that supplied to European cities.

## IMPROVEMENTS IN GAS MANUFACTURE.

The public have waited long and patiently for some important discovery in this direction, which should cheapen if not improve our gas light; and there has been good cause for expectation. Water gas, wood gas, peat gas, atmospheric gas, petroleum gas, decomposition of zinc and steam—all, with variations innumerable, have each in turn been proposed, tried and abandoned and the people have been disappointed in their expectations; yet it has long been acknowledged that the field is a promising one, and full of compensation to any person who will attain even a moderate degree of success.

Notwithstanding the fallacious and impractical ideas with which we have been hitherto disappointed, it does appear that at last a new era is dawning upon the history

of gas lighting—one which promises to touch our gas companies in a tender place, and arouse them from the lethargy into which they appear to have fallen, in consequence of the innumerable failures to improve upon the old routine of manufacture.

## THE ENSLEY GAS.

The experiment which has been made at the Pacific Woolen Mills, under the direction of Mr. Whiteside, as agent for the patentee, is but a repetition of what has been done in several localities at the East, and wherever done is pronounced a success. The art of manufacturing gas from wood, either mixed or unmixed with other substances, is not new. But we are not aware that any such gas has before been made, chiefly from wood, of a sufficiently high illuminating power to secure its general introduction, either into cities or towns. Neither is it any new thing that illuminating gas may be obtained from animal refuse. Seguin, a French chemist, has carried out this process on a large scale, and the San Francisco Sugar Refinery has long been lighted by gas chiefly produced from animal matter; but such manufacture is impracticable on a large scale, and can only be made economical there by the necessity which exists at that establishment of making their own bone-black; the gas being chiefly the waste product of that manufacture.

The novelty and merit of Ensley's invention consists in the discovery of a combination of vegetable and animal matter, and the subjection of the same to a proper degree of heat under proper conditions, whereby a good illuminating gas can be obtained, which will also leave certain valuable commercial products as a residuum. The construction and combination of the apparatus by which these results are effected, is what the inventor claims as *new*, and for which he has obtained patents in the United States and Canada.

Mr. Ensley is said to have spent seven or eight years in studying and experimenting before venturing to introduce this gas to the public. That he produces an excellent illuminating gas, is beyond contradiction. That his process possesses novelty as well as merit, appears to be equally certain. That in its production he can effect a vast saving over the ordinary manufacture, seems to be also well attested.

It is well known to manufacturers of gas and refiners of petroleum, that very diverse chemical results follow the treatment of the same materials at different temperatures and under different conditions of condensation. Mr. Ensley appears to obtain his advantages from a judicious application of heat to the retort, and a proper commingling and cooling of the resultant gases. In the Ensley gas, separate retorts are used for the distillation of the wood and for the animal matter. The gases from these two materials are not allowed to mingle until after a perfect separation and condensation has been made of the product of each retort, by which the fixed gases are fully eliminated from those which are condensable at a temperature of about 60° Fah. Special care is also taken that the crude materials are subjected, as near as may be, to that temperature which is capable of producing a maximum amount of gaseous products.

## THE SOURCE OF ARTIFICIAL LIGHT.

All kinds of material that can be economically used as sources of artificial light, are chiefly composed of only two of the known elements of matter—carbon and hydrogen. All animal and vegetable matter, whether in its living form, or whether fossil, as in coal and petroleum, is composed essentially of these two important elements. The sublimest economy in nature is the storing up, in fossil form, of such immense quantities of these elements, so essential to the existence and social progress of man. The value of these elements in the economy of the world, is in proportion to the purity in which they are found, and the diversity or speciality of their application, depends upon

the relative proportions in which they are combined. If we desire to produce an intensely concentrated and economical fire, we obtain as near as possible a pure carbon—anthracite, coke or charcoal. Such a fire will give no flame; the act of combustion is fully completed the instant the oxygen of the atmosphere is impacted upon the surface of the coal. If we desire a flaming fire, we obtain a fuel which is largely mixed with hydrogen, as a *dilutor* of the heat—spreading it over more surface in the form of a flame. Bituminous coals, oils and wood accomplish this.

It has been found, that if heat is applied to these vegetable or animal compounds of hydrogen and carbon, in a close vessel from which the oxygen of the air is excluded, as in a gas retort, a large portion of the hydrogen and carbon, which previously existed in chemical combination in a solid form, will be evolved in a gaseous combination, which may be collected and used as a light-producing agent. The intensity and value of this light depends upon the character of the combinations made in the retort. If a gas is evolved containing but a small amount of carbon with a large proportion of hydrogen, a very dim light will be produced; on the contrary, if the combination is one where the carbon and hydrogen are nearly or quite equal, a bright light will be produced, but attended with insufferable quantities of smoke, in consequence of the excess of carbon.

## THE DIFFICULTIES ENCOUNTERED IN GAS MANUFACTURE.

One of the great difficulties encountered in gas manufacture is to properly control the chemical combinations within the retort. Another, and perhaps the greatest difficulty of all, is to get rid of the numerous impurities or substances deleterious to light and health, which are invariably evolved from the retort, along with the desired combinations of hydrogen and carbon. No less than fifty-nine different combinations of carbon, hydrogen, nitrogen, oxygen, sulphur, etc., are known to be evolved from the distillation of coal. Of these seventeen are fixed gases, and forty-two condensable at a temperature of 60° Fah.; seven of the latter are acids; fifteen are neutral, and twenty are alkalies. Of these fifty-nine constituents, all but five may be considered as impurities, which it is desirable should either be avoided or got rid of by purification. The five desirable constituents or illuminating agents are—Acetylene, C<sup>2</sup>H<sup>2</sup>; Olefiant gas, C<sup>2</sup>H<sup>4</sup>; light Carbureted hydrogen, (marsh gas), C<sup>2</sup>H<sup>4</sup>; Hydrogen, H and Carbonio Oxide, C O.

## THE SELECTION OF MATERIALS FOR GAS MANUFACTURE.

The innumerable variations of organic matter presented to the gas manufacturer, affords a great choice in their economy and degree of fitness for the production of gas. Hitherto, nearly all gas has been produced from coal; probably for the reason that attention was first directed to that source of supply from its natural exhalations from coal in place. In fact it is only quite recently that any very extended knowledge of the production of gas from other organic matter than coal has been attained.

It may readily be conceived that organic matter which has been suffered to undergo partial decomposition, and which has been subjected to the mineralizing influences of the earth and water for untold ages, must have taken up a large amount of material which must inevitably be detrimental to the production of the simple combinations of hydrogen and carbon, which alone are desirable for illuminating purposes. It does not need the chemist's art to convince us that of the forty-six combinations which the gas manufacturer endeavors to get rid of, a large portion have found their way into combination with the coal during the long interim of its deposit in the earth as a fossil, and the terrible convulsions and slow

process of mineralization which it has there undergone.

This very fact is sufficiently suggestive of the effort to obtain an illuminating agent from living organic matter, before it has become contaminated by time and the elements. The hint has not been overlooked, as may be seen from the long list of patents that have been taken out for obtaining gases from other material than coal; but one scheme after another has been undertaken and abandoned, and none appear to have made any real progress beyond the laboratory, except that of Mr. Ensley.

#### THE CHEMISTRY OF THIS PROCESS

Is, as yet, but very little known, even by the inventor himself. The result obtained seems to have been a "happy hit," rather than a conclusion from previously known facts. In this he is not without precedent; nor is the discovery any the less valuable therefor. A definite and permanently controllable result is obtained; a light is produced fully equal to that from the best coal gas, and far cheaper—precisely the two conditions which have been so long sought after. It would be impossible for us to go into the chemistry of the process, without long and patient research, to be accomplished only by the aid of proper appliances. We must, for the present, be satisfied with the result. That is patent to every one who will take the trouble to go and see the gas, which can be done six evenings in the week at the Pacific Woolen Mills in this city.

The reports from the works of the Cobourg (Canada) Company, are quite full and positive as to the character and permanency of the gas. Its traveling properties are said to be quite equal to that of the best coal gas; the lights at the extremity of the pipes—over a mile and a quarter in direct line, and nearly three miles by the circuitous course of the pipes—burning as brilliantly as those near the works.

That the gas is quite different from the ordinary coal gas, is made sufficiently apparent by the sense of smell alone. It is much less offensive, having nothing of the unpleasant odor of sulphureted hydrogen, as is the case with common gas; but has a slightly pungent, empyreumatic smell. There is every reason for believing that a person would suffer no serious inconvenience from this gas, in a room where death would follow from a liberation of the same amount of ordinary coal gas.

#### ITS ECONOMY.

The accuracy of the following statement of proportions of materials employed in the manufacture, and the resulting residuums, are vouched for by Mr. Moffat, the lessee of the Cobourg (Canada) Works above alluded to.

*Memorandum of cost of manufacturing Gas from Ensley's Patent, as demonstrated by practical test at Cobourg, from one cord of pine wood and 1,000 lbs. of bones.*

Dr.		
One cord pine wood.....	\$2 00	
One-half ton bones.....	4 00	
Three-quarters cord hard wood for fuel, \$3 25 cord.....	2 15	
Cost of labor.....	2 00	
	\$10 15	

Amount of gas produced 15,000 cubic feet, making the cost 67½ cents per 1,000 feet, without taking into account the sale of the residuums—estimate of cost and proceeds of which are as follows:

Cr.		
40 bushels charcoal, at 5c.....	\$2 00	
50 galls. tar at 8c.....	4 00	
12 galls. oil of turpentine, at 20c.....	2 40	
770 lbs. bone black, \$1 30 100 lbs.....	7 70	
½ bbl. ammonia.....	1 00	
	\$17 10	

Less cost of separating turpentine, tar ammonia, etc..... 2 00

Leaving a net profit on the residuums of \$4 95

And the gas free.

COST OF PRODUCING 15,000 FEET CUBIC OF GAS IN SAN FRANCISCO.

The above figures converted into California rates, may be stated about as follows:

Dr.		
1 cord of pine wood.....	\$9 00	
½ ton of animal refuse.....	8 00	
¾ cord of hard wood.....	6 00	
Labor.....	3 00	
	\$26 00	

Cr.		
55 bushels of charcoal.....	\$5 00	
90 galls. tar at 10c.....	9 00	
12 galls. oil turpentine.....	4 50	
770 lbs. bone black.....	7 70	
½ bbl. ammonia.....	1 00	
	\$23 20	

Loss the cost of separating the residuums 3 20

\$20 00

\$ 6 00

Cost of manufacturing 15,000 cubic feet of gas, six dollars, or forty cents per one thousand feet. To this of course must be added the cost of superintendence and interest on investment; for which it will be

seen a very large margin is left. The time occupied in completing a charge of similar gas producing capacity, when wood and animal matter is employed, is only about one-third that required for a charge of coal. We have set down the production of charcoal at only 35 bushels to the cord of wood, instead of 40, as given in the Cobourg report.

#### THE SUPPLY OF THE CRUDE MATERIAL.

We have heard it intimated that it may be found difficult to procure the necessary material for this manufacture. A little enquiry, however, must soon satisfy any person that no difficulty need be apprehended in that direction. An abundance of wood well suited to the manufacture, may be obtained in the mountains back of Redwood City. With regard to the animal matter, a few figures from well established statistics will also set that at rest.

A city of 100,000 inhabitants will need for its weekly supply of meat, the following animals in about the proportion given below:

Hogs—400, say weighing on an average 200 lbs.—50,000 lbs.; bones, say one-tenth of carcass.....	8,000
Cattle—500, say weighing on an average 700 lbs.—350,000; bones, say one-fourth of carcass.....	87,500
Sheep—2,400, say weighing on an average 65 lbs.—156,000; bones say one-sixth of carcass.....	26,000

Making the weekly amount of bones..... 121,500 Or over sixty tons.

The amount of gas which can be produced by the Ensley Patent process, from that amount of bones, together with the proper proportion of pine wood, would be as follows:

60 tons bone will produce at least.....	420,000 feet of gas.
120 cords of pine will produce at least.....	1,200,000 "
Am't of gas that could be made weekly.....	1,620,000

That amount of gas is largely in excess of any reasonable demand for a city of the population named. But if by any possibility there should be a deficiency in animal matter, we can here obtain an almost unlimited supply from the useless fish in our harbor, tons of which, unfit for food, are thrown out of the nets of the fishermen, to say nothing of the immense number of porpoises which swarm in our bays, and which can be delivered on our wharves at a cost not exceeding that of bones, while they will yield a much larger quantity of gas. The supply will also be still further and greatly increased by the large number of horses, and other animals which are unfit for food.

Gas companies, already started, need be under no apprehension of any depreciation in their property, in case of the fullest success of the new process, as it is but a simple and inexpensive matter to alter any ordinary gas works to suit the Ensley process, while no stoppage of the regular production of gas will be required to inconvenience our citizens. The invention is certainly well worthy the examination of our gas companies and of capitalists generally. We hope soon to see it tried on a still larger scale than that employed at the Pacific Woolen Mills.

#### [Special Notice.]

**B. C. HORN & Co.**—The name of this old firm must mingle with every California pioneer's recollections, and must inevitably be allied with that of the choicest brands of Tobacco and Cigars, most of which they have been for many years the sole agents for. With the opening anew of the Virginia tobacco trade, and the increase of business facilities at Havana, Messrs. B. C. Horn & Co. come again proudly before the public with a full columned catalogue of old Virginia and Havana's best productions—known and varied brands of the choicest flavor of "the weed." Turn to their advertisement in to-day's PRESS, and see the list of the good old familiar brands once more in market.

**Gold Bars**, of whatever size, if well cast, assayed for two dollars, at A. P. MOLITOR'S Assay Office, 611 Commercial street, opposite United States Branch Mint. 15v14-3m

**Stebbins' Grinder, Amalgamator and Concentrator**, combined and all within the same pan, can now be seen in operation at the Franklin Foundry, Fremont street, between Mission and Howard. Sulphurets perfectly concentrated within thirty minutes on the rim of the pan near the surface of the water—the process of grinding and amalgamating going on at the same time. All the inventor asks is an examination of his new Concentrator, believing it to be the best and quickest ever yet invented. 14v14 tf

**Save Your Teeth**—Do not have them extracted without first consulting a good Dentist. The loss is irreparable, and, in many instances, unnecessary. DR. BEEN'S, corner of Pine and Kearny streets, makes a specialty of filling the fangs of dead Teeth, and building up broken crowns with pure gold—thus restoring them to their original usefulness and beauty.

Call and examine the work. Finest quality of artificial work also manufactured. 16v14 tf

#### A Paying Newspaper for Sale.

A one-half interest in one of the best Country Papers in the State, is offered for sale on desirable terms. The journal is the oldest in the county, is situated at the County Seat, and surrounded by one of the most prosperous and promising Quartz and Gravel Mining Districts in the State. Inquire at the office of the *Mining and Scientific Press*; or address DEWEY & VAUGHN, Mountain Messenger office, Downieville, Sierra County, Cal. 7v14tf

HAMMERED IRON

Of every description and size.

Orders addressed to PACIFIC ROLLING MILL and FORGE CO., Post Office, San Francisco, Cal., will receive prompt attention.

The highest price paid for Scrap Iron. 9v14-3m9p

## A. S. Hallidie & Co.,

MANUFACTURERS OF

FLAT & ROUND WIRE ROPE,

For Mining, Shipping, Ferry,

AND GENERAL PURPOSES.

Office—412 Clay street. Works—North Beach

NOTICE.—THE FIRST COST OF WIRE ROPE IS MUCH less than that of any other kind of Rope of equal strength, and it is four times as durable. Wire Rope does not stretch or shrink by atmospheric changes; it has but one-fifth the bulk of Hemp Rope; is spliced and repaired in the same manner.

The attention of Mining Companies is particularly called to our Flat and Round Hoisting Ropes, which have been in use for a number of years by the leading mines on the Coast, and to many of whom we refer those interested as to the great advantages over any other kind of rope; effecting an immense saving in expenditure for ropes, fuel, wear and tear of machinery, stoppage of works, etc., besides increasing safety of life.

Mining Companies, in erecting Hoisting Works, should be sure and have their drums and pulleys of sufficient size, whether for wire or hemp rope.

We manufacture of all sizes, and in any length—

Round Wire Rope—Iron or Steel, for Hoisting.

Flat Wire Rope—

Soft Steel Wire Rope—For Derrick Fall Ropes—very strong and durable—one third the weight of hemp of equal strength, (saving in freight for remote localities). Suitable sheaves and blocks furnished when required.

Galvanized or Ungalvanized Round Wire Rope—For Ships' Rigging, Derrick Guys, Ferry Ropes, and all standing purposes.

Steel Ferry Ropes—For wild streams. Ferry Blocks supplied.

Iron and Copper Wire Cord—½ to ¼-inch diameter, for hanging window sashes; Signal Cord; Sash Pulleys on hand.

Comparative Weight, Size and Strength of Iron Wire Rope, Steel Wire Rope, Hemp Rope, and Chain.

Iron Wire Rope.	Steel Wire Rope.	Hemp Rope.	Chain.	Equivalent Strength.
Gr. 100 ft. 100 ft. 100 ft.	Gr. 100 ft. 100 ft. 100 ft.	Gr. 100 ft. 100 ft. 100 ft.	Gr. 100 ft. 100 ft. 100 ft.	Gr. 100 ft. 100 ft. 100 ft.

Pamphlets containing data, with prices annexed, forwarded free, by mail or express, on application to manufacturers. 25v13-6m9p

## Boy Wanted.

About fifteen or sixteen years of age, for errand and mailing clerk. Must write a good hand, and come well recommended. Address or apply at this office.

Established in 1849--Corner First and Mission streets, San Francisco.

HAVING INCREASED OUR FACILITIES IN EVERY DEPARTMENT, WE ARE NOW prepared at the shortest notice and at the most reasonable rates, to furnish all kinds and description of Machinery, including Steam Engines, Quartz Mills, Mining Pumps of all kinds, Hoisting Gear, Gas Work, Laundry Machinery, Architectural and Ornamental Castings, Sugar Mills, Saw and Flour Mills, Water Wheels of all kinds, Hydraulic, Hay, Rag, screw and Drop Presses, Coluing Machinery, Pile Drivers, Bark and Malt Mills, and all kinds of Castings.

**ENGINES.**—Marine Engines, Oscillating and Beam; Stern and Side Wheel Boats, Locomotives, Stationary Engines, Horizontal, Upright, Oscillating and Beam, from six to fifty inches diameter. Also, Scott & Eckart's Adjustable Cut-off Regulator—best in use; W. R. Eckart's Balance Valve for Stationary Engines; Woodward's Patent Steam Pump and Fire Engine.

**BOILERS.**—Locomotive, Flat, Tubular, Upright, Cylinder and Cornish, and every variety of Boiler Work. All sizes of tubes and pipes for pumps.

**PUMPS.**—The Excelsior double-acting Force Pumps are manufactured by us. These very superior Pumps are warranted the best, and are fast replacing all other Force Pumps.

**AMALGAMATING MACHINERY.**—Wheeler & Randall's Improved Tractory Curve Pan, Zenas Wheeler's Improved flat bottom pan, Beldin's pan, Vetch's tubs, Prater's concentrators, Wakley's pans, Boers' pan, German Barrels, Arastra Gearing, Chile Mills, Settlers of all descriptions, Retorts of all sizes and shapes, for Silver and Gold, Portable Stamp Mills, Straight Batteries, for wood or iron frames, Dry Crushing Batteries, or machines with the latest improvements, every variety of Stamps, Mortars, Cams, Pans and Tubs. **BLAKE'S PATENT QUARTZ CRUSHERS**, of all sizes.

**OIL BORING TOOLS AND MACHINERY.**—Of the latest and most approved construction, made from drawings lately made by Prof. Blake at the oil wells in Pennsylvania. We have the facilities for working gold and silver quartz and other ores, to test their value, by the hundred weight or ton.

Russia Iron Screens, of all degrees of fineness and of all qualities of iron. All work done in the best manner at the lowest cash prices.

H. J. BOOTH. GEO. W. PRESCOTT. IRVING M. SCOTT.

Stills, Wrought Iron

Worms, etc., etc.

Manufactured to Order.

Old Boilers Repaired.

D. CAMERON.

A PARIS chemist carried into a theater at 10 o'clock at night, a bottle of ice on a plate, and collected the vapor which condensed rapidly upon it. At first the vapor had the smell, the taste, and so far as could be determined, every chemical quality belonging to the waters of the most deadly fever marshes. Under the microscope, this water was at first clear, but in a week, it was found to be full of animalculæ. A little later these animalculæ had grown, and the big ones were seen pursuing and devouring the little ones. Still later, at the end of two months, the water was thick with animalculæ; various forms were seen, and still the work of destruction was going on. At last but three hideous monsters were seen—microscopic monsters of course, since they were contained in a drop of water—and these were still fighting to see which could devour the other. At the end of three months the water became clear and miasmatic again.

**Forty-Nine and Sixty-Seven.**—The place where once stood one of the most important mining villages in the State (known as Rose's Bar) teeming with the business of some six hundred miners, is now forty feet under ground, made by tailings from the neighboring mountains. The once high and rugged mountain immediately back of the bar, has been, for years passing away, but the richest and best portion is still to be worked. This mountain has furnished the rich hydraulic mining of Smartsville and Timbuctoo for years past, and is still paying.—*North Californian.*

**PUTTING OUT A FIRE IN A MINE.**—During the process of extinguishing the fire in the colliery of Clackmannan, near Stirling, England, in 1851, the mine was filled with about 8,000,000 cubic feet of carbonic acid gas, a continuous stream being kept up night and day for about three weeks. The mine extended over a surface of twenty-six acres, and had been thirty years on fire.

Sulphuric, Nitric and Muriatic Acids of superior quality,  
in quantities to suit.

Orders will be received at the office only for Chemicals of  
every description, which will be manufactured as may be  
required. The Company beg to say that they have the ad-  
vantages of all improved machinery and apparatus for the  
manufacture and manipulation of these products, and our  
Laboratory is fitted up with the most recent improvements  
which experience and science suggest, and is surpassed by  
none in completeness and perfection for the purposes it is  
designed. 9v14-3m

## Overland Route.

## THE PENINSULAR AND ORIENTAL

STEAM NAVIGATION COMPANY'S

### STEAMSHIPS

Leave Hongkong Twice a Month,

(On the 1st and 15th in the Northeast Monsoon,  
and about the 11th and 29th in the  
Southwest Monsoon.)

-FOR-

SOUTHAMPTON AND MARSEILLES,

VIA. EGYPT,

Calling at Singapore, Penang,  
Point de Galle, Aden, Suez, Alex-  
andria, Malta and Gibraltar.

From Point de Galle their steamers run to Madras,  
Calcutta, and Bombay, twice a month, and once a month  
to King George's Sound, Melbourne and Sydney.

From Hongkong their steamers run constantly to  
Swatow, Amoy, Foochow, Shanghai, and Yokohama.  
HONGKONG, 1867. 13v14tf

### PATENT BUSINESS.

We have lately associated with us in the Patent and Me-  
chanical Department of the Mining and Scientific Press, a gen-  
tleman of superior ability and attainments, who has ar-  
rived direct from the leading patent agency in New York  
city, and having a faithful and reliable associate in Wash-  
ington City, we are now better than ever before prepared  
to secure the claims of our applicants, in a careful, prompt  
and efficient manner. DEWEY & O'G.,  
San Francisco, Jan. 1867. Patent Solicitors.

**Economy in Advertising.**—The MINING AND SCIENTIFIC  
PRESS is the best and most economical mining adver-  
tising medium in this city. Our terms are less than one  
half the rates now charged by daily newspapers, and the  
mining community are beginning to appreciate our reason-  
able rates of advertising. The Press contains, proportionally,  
a larger amount of mining advertising than any other paper  
on the Pacific coast. Its character renders it the proper  
journal for the concentration of mining patronage.

## EUROPEAN METALLURGICAL WORKS,

Practical Mining School,  
Bryant Street, Between Third and Fourth,  
SAN FRANCISCO.

THE PROPRIETORS are at all times prepared to work or test  
Ores sent to this establishment—either in large or small  
quantities—by such process as may be found best adapted to  
their chemical character, after a careful analysis has been  
made. Tons lots of Ore adapted to the smelting process at-  
tended to. Sulphuretted pyrites, and the so-called "rebelli-  
ous ores," are having especial attention paid to their suc-  
cessful treatment. Assaying in the humid and dry way.  
Also, refining by cupellation, done at moderate rates.

### PRACTICAL MINING SCHOOL.

The proprietors—encouraged by numerous applications  
from gentlemen desirous of pursuing the study of practical  
metallurgy—have concluded to admit parties on reasonable  
terms. Having in their Mill all the necessary appli-  
ances for crushing, roasting, amalgamating, smelting, re-  
fining and assaying, as also a well extended Laboratory for  
the analysis of Ores and Minerals, a good opportunity is  
here offered to acquire a sound practical knowledge of the  
business.

S. P. KIMBALL,

J. R. MURPHY,

10v10

## MOSHEIMER'S Metallurgic Works

And Practical School for Assaying  
and Metallurgy.

THE UNDERSIGNED HAS REOPENED METALLUR-  
gic Works, and is prepared to reduce any kind of Ores,  
by Smelting, Amalgamating, or other processes, that the  
nature of the ore may require.

Practical instructions given in Assaying, all branches of  
Metallurgy and Technology.

Furnishes Plans and Estimates for the erection of Quartz  
Mills, Smelting and other Reduction Works.

Having carefully studied the science of Concentrating  
Ores, I can offer better concentrating machinery than any  
in use in California, and especially such as will save the  
fine or floating gold and sulphurates.

Pacific Mail Steamship Co's  
STEAMSHIPS FOR  
NEW YORK, JAPAN AND CHINA.

LEAVE FOLSOM STREET WHARF, AT 11

o'clock A. M. of the following dates, for

PANAMA, connecting via Panama Railroad, with one of

the Company's splendid steamers from ASPENWALL for

NEW YORK.

On the 10th, 18th and 30th of each month that has

31 days.

On the 10th, 19th and 30th of each month that has

30 days.

When the 10th, 19th and 30th fall on Sunday, they will

leave on Saturday preceding; when the 18th falls on Sun-  
day, they will leave on Monday following.

Steamer leaving San Francisco on the 10th touches at  
Manzanillo. All touch at Acapulco.

Departures of 18th or 19th connect with French Trans-  
Atlantic Co.'s steamer for St. Nazaire, and English steamer for  
South America.

Departure of 10th connects with English steamer for  
Southampton and South America, and P. R. R. Co's  
steamer for Central America.

The following Steamships will be dispatched on dates as  
given below:

April 30th.—CONSTITUTION, Capt. W. F. Lapidge,

Connecting with the RISING STAR, Capt. Maury.

Cabin passengers berthed through. Baggage checked  
through—100 pounds allowed each adult.

An experienced Surgeon on board. Medicine and attend-  
ance free.

These steamers will positively sail at 11 o'clock. Passen-  
gers are requested to have their baggage on board before 10  
o'clock.

Through Tickets for Liverpool by the Cunard, Inman and  
National Steamship Lines, can be obtained at the office of  
the P. M. S. Co., San Francisco.

For Merchandise and Freight for New York and way  
ports, apply to Messrs. WELLS, FARGO & CO.

For passage and all other information, apply at the Pa-  
cific Mail Steamship Co's office, corner of Sacramento and  
Leidesdorff streets.

OLIVER ELDRIDGE, Agent.

**CRAWFORD'S ELEVATOR.**—We would call attention to the advertisement, in this issue, of Mr. Gluyas, who is agent for this apparatus in California. With this powerful aid, costing less than an extra horse, and weighing scarcely more than a barrel of flour, a mountain teamster can lift his wagon, load and all, out of the mud, and go on his way rejoicing. For miners who have large boulders to lift from their river beds, they are invaluable. Two men can, by its help, with ease raise a mass weighing twenty tons. The farmer, with his boy, can jerk out the most obstinate stumps with scarcely an effort. For a more extended description, see the MINING AND SCIENTIFIC PRESS for March 31, 1886.

**LEATHER HOSE.**—Six hundred feet of 6-inch hydraulic hose has, been lately put up at the leather hose and belting factory of M. M. Cook & Son, at the corner of Battery and Broadway, for the mines of Northern Oregon—no other being found to suit the purpose so well. The same firm have manufactured about the same number of feet of fire hose for an American company in Japan.

### National Mineral Land Law, Instructions, Blanks, Etc.

Copies of the Act of Congress, approved July 26th, 1866, relating to the Location of Mineral Lands, together with the instructions to the "United States Registers and Receivers and Surveyors General," from the Commissioner of the General Land Office Department of the Interior, dated at Washington, Jan. 14th, 1867, can be had at this office. Also a full set of blanks for making applications, advertising, etc. Address DEWEY & Co., office Mining and Scientific Press, San Francisco.

### Perry Davis' Vegetable Pain Killer.

As an internal remedy, has no equal. In cases of Cholera, Summer Complaint, Dysentery, Diarrhea, Asthma, it cures in one night, by taking it internally, and bathing with it freely. It is the best liniment in America. Its action is like magic, when externally applied to bad sores, burns, scalds and sprains. For the sick headache and toothache, don't fail to try it. In short, it is a Pain Killer.

**PERRY DAVIS' PAIN KILLER.**—This medicine has become an article of commerce, a thing no medicine ever became before. Pain Killer is as much an item in every sale of goods sent to country merchants as tea, coffee, or sugar. This speaks volumes in its favor.—*Glen Falls Messenger.*

Sold by all Medicine Dealers everywhere. 14v14-1m

### Allen's Lung Balsam.

The following letter, from Dr. A. L. Scoville, who has had many years' experience in the medicine business, and with Lung Remedies, will give the afflicted still more assurance that the sure remedy is found at last; and the consumptive should lose no time in commencing the use of Allen's Lung Balsam:

CINCINNATI, January 9, 1884.

Gentle—I make the following statement from a perfect conviction and knowledge of the benefits of Allen's Lung Balsam, in curing the most desperate Pulmonary Consumption! I have witnessed its effects on the young and the old, and I can truly say that it is by far the best expectorant with which I am acquainted. For Coughs, and all the early stages of Lung Complaints, I believe it to be a certain cure, and if every family would keep it by them, ready to administer upon the first appearance of coughs about the lungs, there would be very few cases of fatal consumption! It causes the phlegm and matter to rise, without irritating those delicate organs (the lungs) and without producing constipation of the bowels. It also gives strength to the system, stops the night-sweats, and changes all the morbid secretions to a healthy state.

Yours, respectfully,  
A. L. SCOVILLE.  
Consumptives, do not despair, because all the remedies that you have tried have failed, but try Allen's Lung Balsam. Be sure you call for Allen's Lung Balsam. Price One Dollar per bottle.

Sold by all Medicine Dealers everywhere. 14v14-1m

### New Mining Advertisements.

**Arizona Consolidated Mining Company, Euclid District, Arizona Territory.**

Notice is hereby given, that the Annual Meeting of the shareholders of the above named Company, will be held on MONDAY, the sixth day of May, 1887, at 7 o'clock P. M., at the office of the Secretary, 611 Clay Street, San Francisco, for the election of Trustees to serve the ensuing year, and for the transaction of other business.

G. W. BUNNELL, Secretary.

Office, No. 611 Clay Street, San Francisco. ap20

**Evoca Consolidated Copper Mining Company.** Location of Works: Court Hill District, near Black's Ferry, Del Norte County, California.

Notice is hereby given, that the Annual Meeting of the shareholders of the above named Company, for the election of Trustees, will be held on THURSDAY, the twenty-third day of May, 1887, at 3 o'clock P. M., at No. 532 Merchant Street, Room No. 3, San Francisco, California. By order of the President.

R. S. CLYDE, Secretary.

**Hope Gravel Mining Company.**—Location of Works and Property: Grass Valley, Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the fifteenth day of April, 1887, an assessment (No. 14) of one dollar per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at the office of the Company, No. 629 Clay Street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on Wednesday, the twenty-second day of April, 1887, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the eleventh day of June, 1887, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

DAVID WILDER, Secretary.

Office, No. 629 Clay Street, San Francisco, Cal. my20

**Nostra Señora de Guadalupe Silver Mining Company.** Location of Works: Tayolita, San Dimas District, Durango, Mexico.

Notice.—There are delinquent, upon the following described stock, on account of assessment levied on the fifteenth day of March, 1887, the several amounts set opposite the names of the respective shareholders, as follows:

**Camargo Gold and Silver Mining Company, Lander County, Nevada.**

Notice.—There are delinquent upon the following described stock, on account of assessment levied on the 14th day of February, 1887, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
Camp, Jas.....	72	5	\$100.00
Drinkhouse, J. A.....	5	3	60.00
Dinkhouse, J. A.....	51	60	300.00
Harker, W. B. C.....	23	10	200.00
Harker, W. B. C.....	24	10	200.00
Harker, J. W.....	134	3	60.00
Jacobs, J. A.....	135	3	60.00
Fassett, N. C.....	132	1	20.00
Gray, Asaph.....	133	3	60.00
Lander, H. C.....	69	6	120.00

And in accordance with law, and an order of the Board of Trustees, made on the fourteenth day of February, 1887, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the office of the Company, by Jones & Bendixen, Auctioneers, on the 21st day of May, 1887, at the hour of two o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

N. C. FASSETT, Secretary.

Office, 402 Front Street, San Francisco. mar30

**Dardanelles Copper Mining Company, Low Divide District, Del Norte County, California.**

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held at Crescent City, on the sixteenth day of March, 1887, an order was made annulling the assessments levied February 29th, 1881, April 7th, 1885, August 22d, 1885, and June 2d, 1886, and levying an assessment of forty-five (45) cents per share upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary at Crescent City, California.

All stockholders having paid on the aforesaid annulled assessments, will have credit on the new one only. Any stock upon which said assessment shall remain unpaid on the fourth day of May, 1887, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Saturday, the first day of June, 1887, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

G. CURTIS, Secretary.

Office, at Woodbury & Marhofer, Crescent City, California. ap6

**Diana Gold and Silver Mining Company, Lander County, Nevada.**

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-second day of March, 1887, an assessment of five dollars (\$5) per share was levied upon the capital stock of said Company, payable immediately, in United States Currency, to the Secretary, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on the third day of May, 1887, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the fourth day of June, 1887, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

N. C. FASSETT, Secretary.

Office, 402 Front Street, San Francisco. m30

**George Washington Gold and Silver Mining Company.**—Location of Works: Silver Mountain District, Alpine County, Cal.

Assessment No. 18.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the fifth day of April, 1887, an assessment of five dollars (\$5) per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the Company, advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the third day of June, 1887, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

A. G. WOOD, Secretary.

Office, 338 Montgomery Street, San Francisco. ap9

**Gold Quarry Company. Location of Works: Placer County, State of California.**

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-first day of March, 1887, an assessment of twenty dollars (\$20) per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary, (Room No. 4) No. 706 Montgomery Street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the twenty-second day of April, 1887, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the thirteenth day of May, 1887, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

Office, 440 California Street, San Francisco. m9

**Lyon Mill and Mining Company, Kelsey District, El Dorado County, California.**

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the third day of April, 1887, an assessment of two (\$2) dollars per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at his office, 6 Government House, corner of Sansome and Montgomery Streets, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the fourth day of May, 1887, will be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Saturday, the eighteenth day of May, 1887, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

J. M. BUFFINGTON, Secretary.

Office, No. 6 Government House, corner of Washington and Sansome Streets. ap6

**North Star Gold and Silver Mining Company, Reese River Mining District, Lander County, Nevada.**

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the fourteenth day of March, 1887, an assessment of five dollars (\$5) per share was levied upon the capital stock of said Company, payable immediately to the Secretary, GEORGE H. FAULKNER, No. 423 Front Street, San Francisco, Cal.

**BE CAREFUL.**—A Smartsville letter to the *North Californian*, says that Cray & Co., of that place, are running a 200-foot bed-rock tunnel, and have now been using nitro-glycerine for two months for blasting purposes, in preference to powder. The writer says the men handle it with perfect fearlessness. It is true that some of the usual sources of danger in powder blasting are done away with; for instance, the use of a tamping-bar, and the necessity of drawing a charge which has missed fire; but we fear that there will yet be sad experience in its use. It should, in our opinion, not be put into the hands of any but the most careful and intelligent of the workmen. The boldness which is bred by the constant familiarity with powder and its use, is not admissible in the handling of this agent. It is useless to deny that it is yet less perfectly understood than the other; and we urge, therefore, caution.

**HONOR TO WHOM HONOR IS DUE.**—The new mineral "Laurite," discovered by Prof. Wohler, which we mentioned in a recent issue, was so called in honor of the wife of Prof. Chas. A. Joy, of Columbia College, New York. Her name is LAURA.

Mr. Bodwitch states that clay removes ammonia from gas as perfectly as acids and metallic salts do. It has also a remarkable power of acting upon sulphureted compounds in gas, so as to render them removable. The foul clay is worth 21s. per ton as manure, and costs the companies very little.—*Mechanics' Magazine.*

**Gaston's Screw Grinder and Amalgamator**

—15—  
**The Best Yet Invented.**

For rapidity and thoroughness of work, the machine above illustrated is unequalled by any. It wastes no appreciable quantity of quicksilver, and is of itself a perfect settler. Fig. 1 represents the pan with part of its side removed, and fig. 2 the screw muller, and its shoes. The letters show the threads of the screw; H, its shoes, and D a low cylinder within which the screw rotates; E, represents open spaces through the base of the cylinder, and F, inclined partitions filling (at those points) the spaces between the cylinder and the shell of the pan. These inclined partitions are to intercept the current of pulp around the pan, as it issues from under the muller, and turn it toward the center again, over the screw. The dies are not shown in the figure—there are eight. Mercury is not ground, nor floured in this pan. The pulp is ground to a slum, with great rapidity; the muller is raised a little and the quicksilver is poured in *en masse*, forming a layer upon the bottom of the pan. The revolution of the screw then forces the pulp down into contact with the quicksilver, into which it is *effectually rubbed* by the shoes, while the screw, being constantly fed by the pulp from above it, presses all under the muller outward—still in contact with the quicksilver, through the spaces, E, and thence over toward the center of the pan, when it is again seized by the screw and forced down into the quicksilver, rubbed into and forced off in contact with it, which process is continued as long as desired. The pulp can thus be forced into contact with the mercury at the rate of 1,000 pounds in three minutes, or twenty times per hour, and none can escape contact with the mercury, that contact being under the immense pressure of the perpetual screw, in addition to that of gravity, which (gravity) is the only available force in the other pans for bringing the pulp into contact with the quicksilver. "A word to the wise is sufficient." The Screw Amalgamator is the cheapest and most efficient pan manufactured. Millmen! call and see one running at the Pacific Foundry. For particulars, address the inventor, H. A. GASTON, at Cosmopolitan Hotel, San Francisco; or R. L. THOMAS, Esq., Virginia City, Nevada. 1v14qr

**Portable Steam Engines!**

"Hoadley's" and "Hittinger's" Make,

**HOADLEY'S.**  
**FOUR SIZES,**  
8, 10, 12, and 15-Horse Power,

**HOADLEY'S.**  
**3 to 40-Horse Power.**

**HITTINGER'S.**  
**THREE SIZES,**  
5, 7, and 10-Horse Power

**HITTINGER'S.**  
**TWO SIZES,**  
5 and 7-Horse Power,

**COMBINING THE MAXIMUM OF EFFICIENCY, DUR-**  
ability, and Economy, with the Minimum of weight  
and price.  
These Engines are favorably known, a large number  
being in use on this coast for hoisting, pumping, threshing,  
milling and mining purposes.  
Steam can be got up on these Engines in fifteen minutes  
after reaching the place of operation, and the time, expense  
of setting boilers, machinery, and "construction account"  
saved, (which is often the difference between the successful  
and unsuccessful prosecution of mining enterprises), in  
fact, the portable principle is the pioneer's friend, and en-  
ables him to draw engines on their own wheels to his cabin  
door, and plant on the outermost confines of civilization  
the saw and grist mill, and it has done and will do more  
to help subdue the continent than any other of the modern  
motors which are crowding society and normalizing the  
world.  
All sizes on hand from 3 to 30 horse power, with and  
without carriages.  
Also, Portable Saw and Grist Mills.  
For sale by  
**TREADWELL & CO.,**  
9v14-6m15p Corner of Front Market and streets.

**DUDGEON'S PATENT HYDRAULIC LIFTING JACK**, for the purpose of raising locomotives, boilers and heavy machinery or weights of any kind, is a light and portable machine, worked by the labor of one man only, who can raise ten tons through a space of one foot in one and a half minutes, or 100 tons the same distance in ten minutes. A jack for raising four tons weighs only fifty pounds, and one to raise 100 tons, 275 pounds. Its diameter is from two to eight inches according to the power desired, and can be seen at Mr. Dudgeon's place of business on Fifth street, between Market and Mission, together with a **PATENT HYDRAULIC PUNCH**, which is believed to be very efficient and convenient where great power is required with a limited movement. A punch of this kind weighing only forty pounds, with the power of one man exerted on a lever two feet in length, is said to give a pressure of thirty tons.

#### Crawford's Stump and Rock Extractor and Elevator.

STUMP AND SNAG PULLER.

PRICE OF MACHINES:—No. 1, 10 tons, \$200; No. 2, 15 tons, \$275; No. 3, 20 tons, \$350. Small Model Machines—weight 30 pounds—lift 1 1/2 to 2 tons, \$75; other sizes to order.

These Machines are adapted to all kinds of work, and where labor is scarce they are invaluable. Two men can work the machine. A few of their uses are: Loading boilers, granite, heavy ordnance in casemate, or any heavy body. For mountain transporters they are of great value, lifting wagons, etc., clearing lands of stumps, moving boulders for millers, or for railway companies. There is scarcely any work of moving heavy bodies which they are not adapted to. Single Machines, or Right of City or County, and all information can be obtained by letter, or otherwise, by application to  
San Francisco, April 17, 1867.

GRUB AND ROCK EXTRACTOR.

GEO. K. GLUYAS,  
Office California Steam Navigation Company.

#### TO MINERS, MILLWRIGHTS AND FARMERS.

We beg leave to call your especial attention to the

##### EXCELSIOR

##### Double-Acting Suction and Force Pump.

Hooker's Patent, Aug. 15, 1865.

This Double-Acting Suction and Force Pump, the best in use, is more simply constructed, more durable, and has larger and more direct ports for receiving and discharging water, and is warranted to furnish more water, than any other Pump of equal caliber. It has Puppet Valves, faced with vulcanized rubber, which cannot be wrongly placed in the Pump. The valves can be changed without disconnecting air-chamber, suction or discharge pipes.

In case of necessity, the Pump can be run at any high rate of speed, and will furnish water proportionately. The Excelsior Pump is equally adapted to use for surface and deep wells or shafts. It can be run by windmill or horse power for irrigating purposes; also by hand or steam power on steamers and ships. For domestic use, no better Pump can be found.

Fig. 3.

By simply loosening the nut seen at the base of the Air-Chamber, the discharge nozzle may be turned, thus making a right or left-hand Pump.

Fig. 4.

Fig. 3 represents a Hand Pump, which works very easy, and with even power. Fig. 4 is a 6-inch Mining Pump, showing adjustable bonnet of the valve chest.

For Circulars, or further particulars, inquire of or address J. W. BRITTAN & CO., Agents  
120 Front street, San Francisco; H. J. BOOTH & CO., Union Iron Works, First street, or  
1am CUSHING & CO., Prop'rs, San Francisco.

#### PACIFIC BILLIARD TOURNAMENT.

## MINING SHAREHOLDERS' DIRECTORY

(Compiled for every issue, from advertisements in the  
Mining and Scientific Press and other San  
Francisco Journals).

Comprising the Names of Companies, District or County  
of Location; Amount and date of Assessment; Date of  
Meeting; Day of Delinquent Sale; and Amount and Time  
of Payment of Dividends.

NAME, LOCATION, AMOUNT, AND DATE OF ASSESSMENT.	DELINQUENT. OF SALE	DAY	DAY
Abernethy, Virginia, Nev., March 23, \$5.	April 25—May 27	Adella, Sierra Co., Cal., April 9, \$200.	May 9—May 27
Arizona Cons., Arizona Terr., Annual Meeting, May 6.		Big Blue Lead, Kern Co., Cal., Feb. 19, \$5.	April 2—May 22
Becher, Virginia, Nev., March 23, \$12.	April 25—May 27	Becher M. Co., Nev., March 23, \$5.	April 25—May 27
Baldwin, Vir., Nev., March 23, \$3.	April 25—May 27	Batopilas, Chihuahua, Mex., April 11, \$2.	May 16—June 3

\*Those marked with an asterisk (\*) are advertised in this  
journal.

C. T. MEADER has not failed. The sus-  
pension was for a few days only. The house  
has been in full operation for the past two  
weeks. So says the Stockton Independent.

HEAVY FORGING.—The Park Head forge,  
in Scotland, has two seven-ton hammers.  
At this establishment was forged the stern  
frame of the Achilles, weighing forty tons,  
and a crank shaft which weighed thirty-two  
tons.

## San Francisco Mariners' Church.

Among the noble acts accomplished by  
the citizens of San Francisco during the  
past year, we should not fail to mention the  
erection of the beautiful structure, a spirited  
picture of which we herewith present. From  
a graceful tower and flagstaff, rising far  
up above the surrounding buildings, may  
now be seen that familiar blue flag with its  
emblazoned letters, indicating to the mariner  
all along the City Front, where he may find  
a temple in which to worship God, free to  
all of his calling; and where he will find

friends who will take him heartily by the  
hand, point out to him the way of salvation,  
and stand by him at all times and upon all  
days, to save him from temptation and from  
the evil machinations of those who ever  
stand in wait to prey upon sailors and filch  
from their hard-earned gains.

The structure which the generosity of our  
citizens has erected for the benefit of the  
sailors, resident in and visiting this city,  
is located at the corner of Sacramento and  
Drumm streets, has been built at a cost of  
about \$20,000; fourteen thousand of which  
has already been raised and paid over, leav-  
ing an indebtedness of \$6,000. The house  
is 89½ by 50 feet in size, and will accom-  
modate upwards of 400 people. The spire  
is 125 feet high. The architects were S. C.  
Bugbee & Son. The lower story on Drumm  
street is occupied for stores; the Sacramento  
street front is leased by the Board of Edu-  
cation for school purposes. This portion  
of the building will be converted into a  
sailor's reading room as soon as the rents  
and subscriptions have paid off the indebt-  
edness.

The efforts now being made to reclaim and  
elevate the tenants of the forecastle, is one of  
the most important benevolent works of the  
age; and it is gratifying to every philan-  
thropist to learn that San Francisco intends  
to take the lead in this, as she has already  
done in every other work of humanity.  
Clearly it is the duty of the merchants of

every seaport to provide both a temporal  
and spiritual home for the sailor, who too  
often braves the dangers of the deep, in  
navigating their ships across ocean wastes,  
only to meet still greater dangers from the  
land sharks which lie in wait to rob him  
of his hard earnings as soon as he arrives  
in port. We are pleased to learn that both  
are within his reach when he arrives in San  
Francisco, and that the true friends of the  
sailor here are doing a good work, and he-  
ing abundantly blessed in their labors.

## Marquis' Patent Slop Hopper.

We give herewith an illustration of a very  
useful California invention, designed as a  
trap for drains, sinks, cesspools, etc. By  
means of an inside receiver or strainer, the  
waste refuse materials, which so often choke  
up and render useless the common hopper,  
is prevented from entering the conduct  
pipe, and may be readily removed as often  
as occasion requires. This device is dis-  
tinctly shown in the engraving, with its  
perforated sides and bottom, by which the  
liquid is drained off. Underneath this re-  
ceiver is placed a movable, inverted pan,  
standing on legs, and shutting down over  
the exit pipe, which, by protruding upwards  
into the chamber below the receiver, forms  
a trap which effectually prevents the escape  
upwards of any gaseous generations in the  
drain or cesspool. Such a device as this is  
just the thing for which it is intended, and  
just what every owner of a dwelling should  
be compelled to put upon his drain-way,  
where niggardness or lack of interest in the  
general welfare fails to prompt him to a

proper regard for his own or the health of  
his neighbors. Samples of this hopper can  
be seen at most of the plumbers throughout  
the city, and at the office of the inventor,  
323 Montgomery street.

The inventor claims, 1st, the construction  
and arrangement of the stationary hopper,  
and movable hopper, substantially as de-  
scribed and for the purpose set forth.

2d, The bowl or pan, or its equivalent,  
placed upon standards in the bottom of the  
lower ledge in the outer hopper, or attached  
to the inner hopper, and which forms, to-  
gether with the lower portion of the movable  
hopper and the upper portion of the con-  
nection pipe, and the trap, substantially as  
described and for the purpose set forth.

## Contributed for Our Cabinet.

Peter Brandon, superintendent of the  
Yosemite mining company, Santa Fe Dis-  
trict, Lander county, (Smoky Valley) Ne-  
vada, has contributed for our Cabinet  
several specimens of very rich silver ore  
from the Yosemite No. 1, Yosemite No. 2,  
and the Troy mines, all belonging to the  
Yosemite mining company.

147 and 148—From Yosemite No. 1, con-  
tain black sulphurets and chloride, highly  
colored with green carbonate of copper. A  
face 20 feet high has been opened upon this  
ledge, and a tunnel commenced. Assays of  
fair averages of assorted ore from the out-  
crop are said to yield at the rate of from  
\$290 to \$600 to the ton.

149 and 150—Are from Yosemite No. 2,  
upon which an incline has been sunk 58  
feet, developing a 9-foot ledge. These spec-  
imens are similar to Nos. 147 and 148; but  
more quartzose in character. A pulp assay  
of a test lot of ore from this mine, reduced  
by mill process, gave \$200 to the ton, which  
lot was subsequently worked to within 20  
per cent. of assay. This ore is very easily  
reduced, and the precious metals may be  
separated without difficulty.

150 and 151 are from the Troy mine, in  
the same neighborhood and belonging to  
the same company. This mine has not yet  
been prospected, although the specimens  
before us bear a close resemblance to Nos.  
149 and 150. Immediate steps are to be  
taken for the development of this property.  
There is a mill six miles distant, where a  
sufficient amount of rock will be worked to  
prove the value of the mines. If the result  
is as favorable as expected, arrangements  
will be made to put up a mill forthwith.

152 and 153.—Homer Holland sends us  
two specimens of ore from the Badger mine,  
El Dorado county, recently discovered and  
as yet unprospected. Both specimens are  
heavily charged with sulphurets, a large  
portion of which appear in regularly formed  
cubical crystals. The specimens are inter-  
seamed with irregular but well-defined  
seams of white quartz, entirely free from  
any admixture of foreign substance. The  
gangue of one of the specimens, which we  
have numbered 153, is of a dark slaty char-  
acter; the other (152) is much lighter in  
color, talcose, and composed chiefly of  
silica. The sulphurets have very much the  
resemblance of the rich auriferous sulphu-  
rets of Nevada county, and doubtless con-  
tain more or less gold. Their value can  
only be ascertained by assay. The first  
work done on such a mine should be to as-  
certain, definitely, the character of the sul-  
phurets.

COMMUNICATIONS RECEIVED.—"Southeast-  
ern Nevada," from "J. D. E.," "A. C. D."  
in reply to "Machinist" on the "Gravity  
Question;" also clippings, etc., from "C.  
D. V.," Iowa Hill.

A CABINET.—Mr. Robert White, of El  
Dorado county, intends to take his cabinet  
of 2,000 specimens of California minerals  
and curiosities to Europe. He will also  
lecture on California.

## Report of the Mechanics' Institute on the Sutro Tunnel.

Messrs. Wm. J. Lewis, Arch'd Cooper and P. M. Randall, a special committee appointed by the "Mechanics' Institute of San Francisco" to investigate the Sutro Tunnel project for draining the mines on the Comstock lode, in the State of Nevada, submitted the accompanying report, which was unanimously adopted at the regular meeting of the Association, April 4th, 1867. It contains much information which we deem important to place on record in our files:

### DISCOVERY OF SILVER IN NEVADA.

In June, 1859, Peter O'Reilly and Patrick McLaughlin, while engaged in gold washing on a spot which is now the property of the Ophir Company, discovered a heavy black substance, which, upon examination, was found to contain sulphurets of silver of the highest value.

It was ascertained that this substance was a portion of the vast deposit of silver and gold-bearing ore now known as the Comstock lode, so called from a miner named Comstock interested in the first purchase of the adjoining ground.

An excitement unparalleled since the first discovery of gold in California followed; speculators and miners from California crossed the Sierra Nevada Mountains, and rushed to the new mines. Locations were made for miles on the supposed course of the lode, and the flourishing towns of Virginia City and Gold Hill sprung up; the former named after one James Finney, a native of the State of Virginia, who was known among his fellows by the sobriquet of "Old Virginia."

Under rules formed by the miners, similar to those long in use in California, each miner was allowed to locate 200 feet on the length of the lode. These locations were afterwards transferred to companies, and comprises the ground now belonging to the Ophir, Mexican, Gould & Curry, Savage, Hale & Norcross, Imperial, Yellow Jacket, Crown Point, and many other companies not so well known.

### YIELD OF BULLION.

These mines have now a world-wide reputation; the yield of the precious metals from the Comstock lode far exceeds that of any other locality.

The annual produce for the past five years has been, in round numbers, as follows:

1862.....	\$ 4,000,000
1863.....	12,000,000
1864.....	16,000,000
1865.....	15,000,000
1866.....	35,000,000
Total produce in five years.....	\$63,000,000

The total annual production of silver in the world in 1854 is stated by Professor Whitney at \$47,443,200. The bullion obtained from the Comstock lode in 1866 is, therefore, equal to more than one-third in value of all the silver produced in 1854. Mexico, in its most flourishing days, from 1795 to 1810, produced an annual average of \$24,000,000 from several thousand mines. After 1810, when the Revolution took place, the yield of the mines fell in some years to as low a figure as \$4,500,000, but the average from 1810 to 1825 shows \$10,000,000. At the present time the entire product of Mexico does not exceed that of the Comstock lode.

The celebrated mines of Potosi averaged about \$4,000,000 per annum for 300 years; those on the Veta Madre (mother vein) of Guanajuato, about \$3,000,000 for an equal period, and the mines of the Real del Monte Company, on the Biscanya vein, in Mexico, over \$400,000 for the last 110 years, or a total of \$44,000,000—a less amount than has been obtained from the Comstock lode in the last three years.

### PROFITS IN MINING.

The immense yield of bullion from the Comstock lode will lead one to suppose that the profits realized by the owners have been proportional to the yield, but this has not been the case.

It is true that the value of bullion obtained by some companies has greatly exceeded the current expenses; as, for example, the Gould & Curry, the net profits of which amount to over \$3,000,000. But some other companies have expended large sums of money and realized little, and some nothing at all. We have no accurate figures for the earlier years; but, comparing the dividends with the assessments levied, we find that the aggregate produce of the mines has been swallowed up by expenses. In 1865, the dividends paid amount to \$1,900,000, and the assessments levied to \$1,950,000, or \$50,000 more than the dividends.

In 1866, the dividends paid were \$1,794,400; the assessments levied, \$1,232,380. Dividends over assessments, \$562,020. In the first years of operations on the Comstock lode, the expenditures for machinery, which had to be transported from California across the Sierra Nevada Mountains, for the erection of costly reduction works, and for other permanent improvements, together with the extravagant prices paid for reducing ores in a very imperfect manner, absorbed nearly the whole produce. Latterly, the only increase of expense has been in mining operations; as greater depths were reached, a large amount of prospecting or dead work had to be done, and additions made to the pumping and hoisting machinery, almost counterbalancing the reduction in the cost of crushing the ore, of labor, and of freight, and we consequently find that the aggregate profits of the mines at the end of the last year bear but a small ratio to the production.

The cost of labor and of reducing ores will gradually diminish from year to year, and on the completion of the Central Pacific Railroad from Sacramento to the valley of the Truckee river, which will certainly be effected in the year 1868, the price of transportation from San Francisco to the mines will not be more than one-third of the average rates heretofore paid. But we do not believe that any reduction of expenses on these items which can be made will be sufficient to meet the increased cost of working the mines after a few years, when greater depths are attained, if the present system of pumping out the water, and of raising the ore and refuse through shafts to the surface is continued.

In the late report of R. H. Stretch, Esq., State Mineralogist of Nevada, we find it stated that forty-seven steam engines are now in operation on the Comstock lode, which answer all the present requirements; but every addition to the depth demands additional power, correspondent augmentation of capital invested in machinery, and a larger annual demand for fuel. The little wood there was originally in the vicinity of Virginia City was long since exhausted; it has now to be obtained almost exclusively from the eastern slope of the Sierra Nevada Mountains, and as the nearer timber is destroyed, it must be hauled a greater distance and at an increased price.

If we take into consideration the cost of machinery, of annual additions and repairs, and of consumption of fuel, wages of employés, delays caused by breaking of pumps, expense of explorations, obstacles in securing good ventilation and increase of heat with the depth, and the financial result of past years, we are forced to the conclusion that the mode now adopted of working these mines cannot long be prosecuted with profit to the owners.

The result of similar operations in other countries, as furnished by Humboldt, Ward, St. Clair, Duport, and other writers, conveys an instructive lesson for persons interested in mining enterprises. These authorities agree that mining from the surface must always prove suicidal to the interests of the owners when the position of the mines will allow the construction of adits or tunnels, which will drain the water, ventilate the mines, and diminish the cost of removing the ore and valueless material.

Humboldt, in his "Assay Politique sur la Nouvelle Espagne," published in 1803, in reference to the Veta Madre of Guanajuato, a lode much resembling the Comstock, exclaims:

"It is, indeed, strange that mines of such richness have no tunnels for draining when the neighboring ravines of Cata and Marfil, and the plains of Tumascatio, which are below the level of the lowest works of the Valenciana mine, would seem to invite the miner to commence works which would serve for drainage and at the same time afford facilities for transporting materials to the smelting and amalgamation works."

A gentleman of intelligence, whom Humboldt questioned in regard to this want of wisdom, replied, "that the excavation of a general tunnel would be a work very expensive, and perhaps impossible, on account of the want of union among the proprietors of the different mines."

### THE VALENCIANA MINE.

Upon this lode is located the celebrated Valenciana mine, which, according to Humboldt, was first opened by Obregon, a young Spaniard, who, without means, commenced prospecting on a part of the vein which up to that time had been unproductive.

After undergoing many privations, he at last struck an immense body of ore, from which alone was extracted, from the first of January, 1787, to the 11th of June, 1791, the sum of \$14,764,492 of silver, out of 134,988 tons of ore. Señor Obregon, afterwards known as the Count of Valenciana, became the richest man in Mexico, and

probably in the world, at that time. As greater depths were attained, the increase of expense became such that the mine ceased to yield a profit, and before the breaking out of the revolution in 1810, it was allowed to fill with earth and water. In 1825, this mine, together with many others, fell into the hands of a wealthy English company, who expended twenty-one months in draining it of water; but the expenses of mining and pumping were so great that after some years the lower works were again abandoned.

### THE ENGLISH REAL DEL MONTE COMPANY.

The most remarkable and disastrous experience made by any foreign company in Mexico has been that of the English Real del Monte Company.

They became, in the year 1823, the possessors of the Biscanya and several other veins, the former having been worked for many years, and having yielded large amounts of silver, prior to 1749. At that date an intelligent miner, named Bustamante, concluded to run an adit, or tunnel, in order to effect their drainage. He labored long and patiently, and was supplied with means by Don Pedro Terreros, who continued the work after the decease of Bustamante. In 1759 the vein was reached, after running a tunnel 9,000 feet in length, cutting the vein at a depth of 600 feet beneath the surface, and exposing to view an immense body of ore. Terreros, in the twelve succeeding years, drew from his mines a clear profit of \$6,000,000; he obtained the title of Count of Regla by the munificence of his donations to the Court of Madrid; he presented Charles III. with two ships of the line (one of 112 guns, constructed at Havana of the most costly materials), and accommodated him besides with a loan of \$1,000,000, no part of which has been repaid.

His successor, the second Count, continued the working of the mines, but not with equal profit, for the upper portions of the vein being worked out, he was compelled to go below the adit, and the water encountered required 1,200 horses to pump it out, at an annual expense of \$250,000. After struggling for many years, and after a depth of 324 feet under the adit had been reached, the work was abandoned, and the mine allowed to fill with water.

It was in this state when the English Real del Monte Company took possession; they expected, by substituting powerful steam machinery for the horse whims which had been employed by the Mexicans, to make the mines again profitable. The result, however, was very disastrous, for in the 23 years they held the mines the expenditures were \$15,381,633; while the total yield was \$10,481,475, showing a loss of nearly \$5,000,000.

They first erected two steam engines of 36-inch cylinders each, which freed the mine from water to a depth of 324 feet under the adit; at this point another one was required and erected, of 54-inch cylinder, by which the working was carried to 724 feet under the adit; but here again the engines were overpowered, and still another engine of 75-inch cylinder was erected.

Mr. John Buchan, the Superintendent of the mine, in one of his reports, made in 1852, says:

"After the mine had reached a depth of 710 feet under the adit (1,310 feet below the surface), the difficulties of drainage had so increased, both from augmented quantity of water and the greater height to raise it to the point of discharge, that three powerful steam engines could barely stem the coming waters of the mine."

"With the increased difficulty of drainage, seeing three bunches of ore worked out, and a debt of \$5,000,000 still outstanding, it is not surprising that the energy and perseverance of the English adventurers were at last exhausted."

"Had the company prosecuted a projected deeper drain tunnel, it would have secured the continued prosperity of the mines for many years to come. It will be remembered that the first Count of Regla distinguished himself and made the fortune of his family by driving the present adit; the second Count reached down 324 feet below it, being the limit to which the mines could be worked with profit by horse-power drainage. The English Company, by the powerful aid of steam machinery, carried down the workings to 720 feet below the adit; but here we find another limit to profitable working, as the deeper excavations of the Biscanya vein are again abandoned to fill with water."

"A deeper adit, which had to be driven a distance of 13,500 feet, had been commenced by the second Count. The English Company, unfortunately, adopted the more speedy plan, as it was supposed, of employing steam engines, instead of the slower but surer plan of driving home the deep

adit, which could have been done with the investment of but little more capital than that expended in applying steam engines, and would no doubt have given a very different turn to the fortunes of that company."

Mr. W. P. Robertson thus relates the financial history of this company:

"The London Real del Monte Company commenced working on a magnificent scale; then, under the influence of a panic, suddenly deserted, in the most critical time, their judicious and indefatigable agent at the mine, and the result has been unmitigated ruin. The mania in London at the time (1823 to 1825) was so strong and so general that no expenditure was for a moment grudged. People thought they were laying out tens to receive back thousands; so they paid up their tens with surprising alacrity. The management in London of many of the new companies under the reaction was miserably bad, and, in the end, many of the shareholders were completely ruined and retired to cottages, there to abandon forever their 'Chateaux en Espagne.'"

"In 1825, the late Mr. Kinder, the enthusiastic leader of the Real del Monte Company, was offered \$8,000 for each of his 30 shares of \$500 paid up in that concern; he refused to sell—that is, he would not take \$240,000 for what had cost him \$15,000. The reaction set in, and down went all shares. In 1845-46, those of Real del Monte were to be had at \$12.50 each; that is, Mr. Kinder's thirty shares, which in 1825 were worth \$240,000, had gradually dwindled down to \$375! The company was all but bankrupt; no more assessments were listened to; and the debts could not be paid with unsaleable engines, though they kept up their steam, nor yet with stones, although silver was in them. The shares have since gone to nil; no one will have them, fenced in as they are with unknown responsibilities and debts. In vain did their new, active, intelligent and enterprising, though prudent manager and agent, Mr. Buchan, write to the shareholders to take heart and not to throw away their property. They had been panic-stricken in the first instance, they had got sick of the business in the second, and in this last and most helpless fit, they entered into negotiations for the sale of the property to a Mexican Company. A bargain was struck, and the perpetual lease of Real del Monte, with everything on it, passed from the hands of the Real del Monte bond-holders for an old song. The entire sum paid was \$130,000 for a business on which \$7,000,000 had first and last been expended, and even of the mite to be recovered, three-fourths were not to go into the hands of the bond-holders at all, but to be appropriated in Real del Monte itself, in the liquidation of sums still due to the servants of the old company. What a winding up! Shares once worth \$8,000 each, now not worth thirty cents! and the actual movable property on the estate, in houses, workshops, machinery, crushing establishment, timber, wood, iron implements, utensils, steam engines, horses, horned cattle, mules, and many valuable miscellaneous materials, must be worth altogether some millions of dollars. The house of Regla alone cost a million and a half, and now is valued at a million of dollars—all gone for \$130,000!"

"Thus did Real del Monte pass from the Counts of Regla in Mexico, and thus has it passed from the luckless shareholders in London—the first paying the penalty of personal extravagance, the other an equally severe one of wild speculation and injudicious management. It is now in wiser hands than theirs, and prosperity dawn again on this almost national establishment or colony."

This history of the Real del Monte mine teaches a valuable lesson, confirmed by the result of almost every similar enterprise in Mexico. They show that after a certain depth has been reached, and no drain tunnels constructed, the mines have been abandoned and the proprietors ruined.

St. Clair Duport, who published a work on the mines of Mexico in 1843, gives a general sketch of mining operations, which is a perfect representation of recent experiences in California and Nevada. He says:

### "OPENING A MINE"

By accident, somebody discovers, guided by the croppings elevated above the soil, quartz containing some metal. He exposes some pieces to white heat, and if he discovers thereon globules, or pearls of silver, he takes up the claim. The discoverer now seeks partners with capital to work his claim, as generally the means of one man are not sufficient for such an enterprise. At first they generally seek to extract the ore by following down on the vein, and open a number of shafts along its course; but in the same ratio as these shafts increase in

depth the water increases too; galleries and new shafts become necessary, and finally, as is generally the case when the largest portion of the yield has been expended in such operations, particularly in mines which are not extraordinarily rich in minerals, the work has to stop on account of bad air and abundance of water, the improvements being of no further use.

"The owners now look for new partners; if the vein presents probabilities of richness at a greater depth, persons can be found who, for a portion of the stock, generally for half, advance the necessary means which is to be repaid out of the first yield of the mine.

"After the water has been removed, and the shafts and galleries are made, and really rich ore is found, then commences the good time of the mine. Arrived at a depth where silver generally is abundant, and when the expenses to bring the water and ore to the surface are not too great, mining is a good paying business; that is what is called in the miner's language 'labonanza.' This time is hoped for with ardent desire, not only by the owners of the mine, and the miners employed, but also by the entire neighborhood. In this case labor, and all necessary articles for mining, are in demand, and well paid for; the money earned with ease is spent freely, and everybody in the whole mining region having any claims is full of hopes to strike it equally rich. The buildings for the reduction of ores are now erected, and very often in a style altogether too costly for their use. Next underground works are constructed to facilitate the hoisting of ore and water. In case the mines in 'boanza' belong to private individuals, these works are executed on a substantial basis, with a view of usefulness for the future. But in most cases, when a mine is divided amongst a number of shareholders, they present such a diversity of ideas that they often cannot agree upon anything at all, except to extract the most money from their mine in the shortest time possible, without even looking ahead for a few months. For this reason we cannot find one single well-worked gallery in such mines. The richest ore is torn from the mine, and less rich ore remains untouched, to be taken out when 'labonanza' ceases. It is difficult to understand why in times of prosperity a small portion of the yield is not spent to make new developments.

#### ABANDONMENT OF THE MINE.

"The pay streak once traversed, and the increased depth rendering the price of extraction too considerable, the 'bonanza' ceases. The less rich ore left in the mine is now taken out, and one of the greatest expenses being the keeping down of the water, the lower qualities of ore are abandoned.

"The reserved middle class of ores will pay expenses to explore the mine for a while, but the time arrives when a day's work, or the value of a pound of ore, ceases to pay, and the mine is thereafter entirely abandoned.

The author of the above description of mining operations in Mexico, written twenty-five years ago, could not have given a more truthful account of operations in the Comstock lode had he spent the last six or seven years in Virginia City. Our mining companies have been pursuing exactly the same course, and have followed in the footsteps of their Mexican predecessors. Ruin of the owners and abandonment of the mines has been the result there; ruin and abandonment must follow upon the suicidal course pursued here.

#### MINING IN EUROPE.

If we turn to Europe, however, we find that mining is carried on with intelligence, economy, and with a view to permanency. In England but few mines are located at any considerable elevation above sea level, and deep drainage by adits is impossible. But each mine has its adit, however small its depth may be beneath the surface, and in stating the depth of shafts in England they are given from the adit downwards; what is above the adit is not counted at all.

The most remarkable work of this kind in Great Britain is the great adit in Cornwall, of which an English writer says:

"The advantages of working mines by adits are well shown at the United mines, near Redruth, where an adit has been driven, commencing only a few feet above the sea level, which, with its branches, has a length of from thirty to forty miles, and a depth under the mines of from 180 to 420 feet. By means of this work a saving in the consumption of coal is effected amounting to 24,000 tons per annum. This magnificent undertaking was completed in 1768."

#### MINES IN GERMANY.

The mines in Germany present by far the finest field for studying mining operations reduced to a science. There mining schools and learned professors have for years prepared young men, who were to be placed in charge of mines, with a thorough knowledge

of all the varied branches required of mining engineers. It is owing quite as much to intelligent management as to the low rate of wages that mines are profitably worked in Germany which would be considered valueless in California or Nevada. There we see the most complete systems of drainage and ventilation, and mines placed beyond the usual contingencies of such enterprises, yielding nearly uniform dividends, and regarded by capitalists as good security for investment.

#### THE FREIBERG DISTRICT.

A few years since it was proposed to drain the Freiberg mining district by an adit-level of the extraordinary length of twenty-four miles, which would cut the vein at a mean depth of 2,000 feet. This plan was vigorously supported by Von Beust and other eminent mining engineers, and received the sanction of the Saxon Government. This gigantic work has not yet been commenced, but a deep adit is now being driven, which will drain the mines 400 feet below the present deepest natural drainage and will have a length of a little over eight miles. It is eight feet wide, nearly ten feet high, and rises in the whole distance twelve feet six inches.

In the Harz district some mines have attained an immense depth. The mine of Andreasberg has a depth of 2,450 feet, being one of the deepest mines in the world; adits have been run there for centuries, the largest of which was completed three years ago.

#### THE ERNST AUGUST TUNNEL.

We make the following condensed extracts from a report made by Dr. Geissler concerning this great work, called the Ernst August Tunnel, after the late King of Hanover:

"On the 22d of June, 1864, a drain tunnel was completed which may be called the greatest work of the kind ever executed. To explain its objects and importance it will be necessary to give the following details:

"The mines of the Harz were about to be abandoned, or, more properly speaking, about to be drowned out by water beyond redemption. In the course of time the explorations in those mines went deeper and deeper, until they reached a depth of 2,000 feet. While the higher situated galleries ceased to yield pay ore in sufficient quantity, the exceedingly rich ores discovered in the lowest levels could not be reached on account of great hodies of water, which pumps and engines could not master, and the lower levels had to be, for the time being, abandoned.

"There have been drain tunnels in the Harz for a long time, which were used as canals for the transportation of ores. Already at the commencement of the sixteenth century mechanical means to remove the water from the mines were insufficient, and drain tunnels were constructed at that early period. The first tunnel was commenced in 1525, another in 1548, one in 1551, and still another in 1573. By aid of these tunnels mining was continued in those districts for 200 years, but about the middle of the last century it became difficult again to master the water.

"In 1799 another deep tunnel—having a length, including galleries, of 57,000 feet, or nearly eleven miles—was completed. But this also, afterwards, was considered insufficient for future purposes, for notwithstanding additional engines might have been used for a while, their dimensions and cost in mines which had reached such an enormous depth would have been very great. And, after all, the surest and cheapest way for water to be removed is by its natural flow; the engines have enough to do in pumping the water up to the Ernst August Tunnel, as that gives the deepest natural drainage which can ever be obtained.

#### DESCRIPTION OF TUNNEL.

"In 1850, after careful surveys and due consideration, the construction of the Ernst August Tunnel was resolved upon; it was to commence at Gittelde, a little town at the foot of the Harz Mountains, and it was estimated that twenty-two years would be required for its completion, but it only took a little over half that time, for it was entirely completed in twelve years and eleven months. Nine shafts had been sunk, from which eighteen galleries or drifts were run, and one from the mouth, so that the work progressed from nineteen different points. The connections were made with such perfection that they could not be recognized after they were completed.

"This tunnel has a uniform fall of 5-4 10 inches to each 630 feet, or 1 in 1,400; its height is 8 feet 3 inches; its width, 5 feet 6 inches, and its shape that of an egg. The water has a sufficient depth to allow the use of long flat-boats, for the transportation of ore. A part of the water course is covered over, to be used as a sidewalk for the miners."

#### NECESSITY OF A TUNNEL TO THE COMSTOCK LODGE.

We have thus far reviewed the results of mining experience where drain tunnels have not been, and where they have been constructed, and the conclusion your committee arrives at is, that a deep drain tunnel to the Comstock lode will not only greatly facilitate mining operations, but it is an absolute necessity; the sooner it is constructed the more benefit will be derived therefrom, and without it nothing is more certain than the abandonment of those mines before the lapse of many years.

The necessity of the tunnel having been sufficiently demonstrated, it remains to show that the ore which will probably be obtained from these mines will justify the cost of construction.

The first question to be examined is, whether the ore in the Comstock lode extends to an unlimited depth. This question has been so ably handled by Baron Richtofen, an eminent geologist of the highest European reputation, that we content ourselves by giving some extracts from a letter written by him upon this subject, in February, 1865, and published in one of the pamphlets issued by the Suto Tunnel Company. For a more detailed account of the geology of the Washoe country we refer to his able report, to be seen on the tables of this Institute.

#### CONTINUITY OF THE COMSTOCK LODGE.

The learned Baron says: "The value of a deep tunnel will, of course, chiefly depend upon the question whether these mines will ever be worked to considerable depth; that is, whether the Comstock vein will extend far down, and whether it will retain its metalliferous character in depth. Both questions will have to be decided from the study of the structure and nature of the Comstock vein, and from comparing the results with the observations at such mines in other countries which have already been worked to great depth. My experience on the Comstock vein is based on close and repeated examinations of nearly all the mines on its course. I believe I concur with almost everybody who has had equal experience about them, in the opinion that it is a true fissure vein, of extraordinary length, and extending downward much further than any mining works will ever be able to be carried on. It would be too lengthy to enumerate the various reasons which lead most positively to this conclusion. It is now assumed almost universally as a fact, and the number of those who consider it as a gash vein, or a system of gash veins, is fast diminishing.

"As to the downward continuance of the ore-bearing character, every instance goes to show that the average yield in precious metals remains about the same at every depth. Some mines had accumulations of ore near the surface (Ophir, Mexican, Gold Hill); in others, they commenced very near under the surface (Gould & Curry, Potosi, Yellow Jacket, Belcher); at others, again, considerable work had to be done before hodies of ore of any amount were struck (Chollar, the southern part of Gold Hill, Uncle Sam, and others), and some which had no ore heretofore, appear to have good prospects to find it soon. The fact that some rich hodies of ore, which were found near the surface, gave out at a depth of a few hundred feet, induced the common belief that the Comstock vein was becoming poorer in its lower parts. But the explorations of the last few months have entirely defeated this opinion. On the contrary, the enormous amount of bullion which is being produced by the mines at present may almost appear to prove that the vein is improving in depth. But this conclusion is probably equally fallacious, as it must be borne in mind that many mines have been developed at different levels, and ore is being extracted from several of those. Hoisting works and the mode of extracting the ore have also been improved, and of course help to increase the daily produce. This average equality of the produce of the vein at different levels is not only true for the amount of ore extracted, but also for its yield. The rich body of ore in the Ophir and Mexican mines forms the only exception to this rule, as none of equal average percentage in silver and gold has been found again. Even the relative proportion of gold and silver in the ore has not undergone any material change, though the bullion, on account of the more imperfect process of reduction, contained at first proportionately more gold than at present.

"There is no reason to doubt that the equality of the average produce and yield throughout the entire length of the vein will continue downward to any depth. Besides the very obvious theoretical conclusion, that vast amounts of silver could not be carried into the fissure from the overlying or enclosing rocks, but naturally had to rise from unknown depths, through the

channel of the fissure itself, to be deposited in it where the conditions for sublimation or precipitation were given in its open space; experience in other countries by no means shows of a regular decrease or an increase in yield as of common occurrence, though either of them may happen. More commonly, the produce of true fissure veins in precious metals has been found to be about constant."

The Baron wrote the above over two years ago. The explorations made since that time in the Hale & Norcross and other mines, strongly confirm the views expressed by him.

Nearly all writers who have specially studied the question of the continuance of mineral veins in depth, have arrived at the same conclusion. We will give an extract upon this subject from an eminent French writer, Mr. Burat. He says:

"In all countries where isolated veins are worked, a large number of them have been abandoned and taken up again; abandoned because accidents or barren streaks rendered the working burdensome; and afterwards taken up again, when they have, by the aid of capital, been made productive mines. The same veins have been declared to be rich or exhausted, for these reasons, at different times; exhausted always when the owners were discouraged, and rich after the execution of further works had pierced the barren places. These are the facts, of which we will relate several examples, and by which we intend to prove that each reworking of a vein after an abandonment more or less long, bears witness of the continuity of mineral veins in depth."

Burat and other prominent writers recite numerous instances of this kind, but we cannot give place to them in this report:

#### THE SUTRO TUNNEL.

The proposed tunnel begins 3½ miles below Dayton, between Corral and Wehher Cañons. The distance from the mouth of the tunnel to the Savage works is a little over four miles, but as the Comstock lode dips to the east, it will be cut in 20,178 feet. It will pass through the different ledges in Silver Star and other districts nearly at right angles. Allowing a grade of one inch in 100 feet, or four and four-tenths feet per mile, it will be 1,922 feet below the floor of the Savage works. The topography of the country is admirably adapted for sinking shafts, four of which are proposed to be put down. They will not only supply the tunnel with fresh air, but will greatly expedite work, as drifts can be run each way after reaching the grade of the tunnel. The distance of the first shaft from the mouth of the tunnel is 4,070 feet—depth, 443 feet; second shaft from first, 5,150 feet—depth, 980 feet; third shaft from second, 4,060 feet—depth, 1,436 feet; fourth shaft from third, 4,654 feet—depth, 1,360 feet; from fourth shaft to Comstock Lode, 2,244 feet—depth, 1,942 feet. These are convenient distances for working and ventilation. The mouth is about one and a half miles from Carson River, and 150 feet above high water mark. There is a gradual descent for about one-third of a mile, in which a fall of 100 feet is obtained, giving sufficient area for dumping and mill-sites.

The vertical section of the tunnel through rock not requiring any support is a circle of twelve feet diameter, with offsets 3½ feet from the bottom, about one foot wide, which support the superstructure of the railroad track to be used for removing ore and debris from the mine. The space under the superstructure is for drawing the water from the lode. Where timber supports are required to sustain the adjacent rock, the top is level, and ten feet wide, clear of the framing; eight feet to the bottom of the timbers supporting the railroad, where it is twelve feet wide in the clear. Below this there is a triangular space, three feet seven inches in depth, forming the water way.

The estimates of the cost of construction have been very ably discussed in a lengthy report by R. G. Carlyle, Esq., covering some 200 pages of manuscript and illustrated by numerous well-executed diagrams. Mr. Carlyle has resided some years in Virginia City, when he was the Engineer of the Gould & Curry company, and appears to be perfectly familiar with everything connected with mining in that country. The minuteness with which he goes into the details of the proposed work, the elaborate calculations into which he enters, and the scrupulous manner in which he weighs his conclusions, entitle his report to careful consideration.

It is impossible for us to give more than a condensed abstract of the results he has obtained. The basis of his calculations is the experience of himself and others in mining near Virginia City, and the statements of Baron Richtofen in regard to the character of the material encountered in the

construction of the tunnel. The Baron says:

"The facilities of excavating the tunnel would depend mainly upon the quality of the rock through which it will pass. It is a remarkably fortunate coincidence that the route selected by Mr. Sutro not only gives the greatest depth, is the shortest, has the best facilities for working shafts, but promises also in this respect to be the most advantageous. The first 600 or 700 feet will be through trachyte and trachytic breccia, which, in a broad semicircular belt of prominent hills, swing from Dayton by the Sugarloaf, to Washoe Valley. Trachytic breccia may easily be worked by the pick, yet is ordinarily solid and dry enough to require no timbering. An idea of its excellent qualities for tunneling may be formed from the fact that in Hungary wine cellars hundreds of feet in length are with preference excavated in this kind of rock. The solid trachyte is an excellent blasting rock. Its superior qualities have caused its general use in Washoe for building material; it was as such applied in the construction of the solid masonry of the Gould & Curry mill. With the use of the drilling machine of Mount Ceniz, speedy work will be made in this rock. The next 2,500 feet will, to all probability, exhibit a great variety of rock, some of which will be rather hard. The following 10,000 feet to the cutting of the vein will most likely consist of the same material as is traversed by the numerous tunnels which lead at present to the Comstock vein. This rock (trachytic greenstone) would offer some obstacles if it were in an undecomposed state. But from the general nature of its decomposition, which evidently was performed from below by ascending steams and vapors during a time of volcanic action, we believe we are justified in the conclusion that it will be found for the entire length of 10,000 feet of the same rotten nature as in the shallow tunnels at present in existence, and it may have to be timbered the whole distance."

Mr. Carlyle speaks as follows in regard to his experience with the two principal kinds of rock to be encountered:

"While I was in the employ of the Gould & Curry as their Chief Engineer, we used solid trachyte for building purposes, taken from a quarry on the side of the Sugarloaf Mountain. I had, therefore, considerable opportunity of learning the particular characteristics of the stone. It is not porous, but is very close in its nature, has very few seams, no grains or special tendency to fracture in any particular direction. It is rather soft, and, in consequence, is easily drilled to any desired shape. The rock drills well and blasts freely, as it does not seem to have much cohesion on account of its many component parts. The rock does not air-slack; on the contrary, it grows harder by exposure."

This rock is extensively used for building purposes; all the stone buildings in the town of Dayton are constructed of it.

His experience in working greenstone porphyry he gives as follows:

"This class of rock is traversed by several tunnels to the Comstock lode, all of which were easily worked, and they had to be supported by timber. The Gould & Curry lower tunnel is the only exception to this, as it passed through 1,400 feet of undecomposed rock which was not difficult to work on account of its favorable stratification; powder was used but to a small extent, and this for the purpose only of shaking the mass. The remaining 800 feet to the lode had to be timbered, as the rock would not support itself. The whole length of this tunnel, 2,200 feet, was run from one working point in 486 working days, or sixteen months; the work, however, was distributed over a period of two years, as it did not progress steadily. The average daily progress was nearly five feet."

Mr. Carlyle estimates that 10,535 lineal feet of tunnel will be through solid rock, and 9,643 through decomposed rock, requiring timbering.

Shaft No. 1 is 7½ feet by 13½ feet, and shafts Nos. 2, 3 and 4 are 7½ feet by 14 feet outside of planking. They are timbered and planked from top to bottom, and divided into two compartments—one for pumping out the water, and the other for raising the excavated material.

Preliminary tunnels are driven from the bottom of these shafts in both directions till they meet. These tunnels are in solid rock, five feet in width and seven feet high, the top being a semicircle. In rock requiring timbering they are of a box shape, four feet wide on top, five feet on bottom, and six feet four inches inside of the timbering, with a channel below for drainage.

#### TIME REQUIRED TO FINISH TUNNEL.

"The time required to sink the different shafts on the Sutro Tunnel and make connections of the drifts from the same, I esti-

mate as follows on the basis that four feet can be sunk per day on the shafts, and five feet made on the drifts:

Connection from drift No. 1 in 462 working days.  
Connection from drift No. 2 in 693 working days.  
Connection from drift No. 3 in 705 working days.  
Connection from drift No. 4 in 815 working days.

"Since all these shafts would be progressing at the same time, the connections from shafts Nos. 1, 2 and 3 will be made before those of No. 4, and the whole time, therefore, required to finish a preliminary tunnel to the Comstock lode would be 815 days.

"The enlargement of this preliminary tunnel will progress from the mouth from time to time as the excavations are made, and will be completed up to a point midway between shafts 3 and 4 by the time the last connection is finished. From that point 4,618 feet would still remain to be enlarged, which would occupy 116 days. The total time, therefore, required to complete the Sutro Tunnel to the Comstock lode would be 931 days, or two years, six months and twenty-one days."

The committee would remark in regard to the removal of the rock for 4,618 feet, that estimating the sectional area at nine yards, the amount is only 13,854 cubic yards, on which, as the cut can be worked all along the top and at the two ends, sufficient number of men can be employed to remove it in the time indicated.

Mr. Carlyle then cites numerous instances of shafts sunk by different companies, and tunnels driven to the Comstock lode, which prove that his estimate of four feet per day in sinking shafts and five feet in driving tunnels, whenever prosecuted with energy, is confirmed by experience, making due allowance for their size and other circumstances which in some cases have retarded work.

Your committee are of the opinion that, with proper energy, a sufficiency of capital, and provided no extraordinary obstacles are encountered, the tunnel might be finished in the time stated, but it is so well known that delays are met with in works of this kind, from causes impossible to anticipate, that it is probable that an additional time of at least one year may be occupied. It is safe to say that, making all due allowance for contingencies, the tunnel can be completed in from three and a half to four years.

#### COST OF THE WORK.

The estimate of Mr. Carlyle is given very much in detail, and is accompanied by a number of bids from miners, foundrymen, boiler-makers and others, who state the prices at which they are willing to make the excavations, furnish the machinery and necessary mechanical works connected with the enterprise.

As the calculations of quantities are made with an unusual degree of care, there seems to be very little margin for variation from the estimate. We extract from Mr. Carlyle's report the following table of the cost of the work, which includes cost of tunnel, of a double railroad track and cars, stationary engines, ropes and fixtures for the removal of the ore from the lode to the mouth of the tunnel:

#### SUMMARY OF ESTIMATE.

Materials and labor for sinking shafts and running preliminary tunnel.....	\$416,467 05
Materials and labor for enlargement of preliminary tunnel.....	619,854 10
General materials and sundries not included above.....	66,439 03
Machinery for the shafts.....	121,679 00
Boilers for above machinery.....	33,126 40
Erection of machinery and necessary buildings.....	32,265 00
Expense of operating machinery in sinking shafts.....	138,734 27½
Expense of running preliminary tunnels.....	\$24,784 90
Cost of best appliances complete for hauling out ore (3,000 tons per day).....	49,326 00
	\$1,503,287 72½
Add 10 per cent for superintendence and general contingencies.....	150,328 77½
Grand total.....	\$1,653,616 50

Cost per lineal foot, \$98.25.

In the above estimate the cost of sinking an aggregate depth of 4,220 feet of shafts was—

For labor, excavating shafts and setting the timbers (from proposal of William Veelen).....	\$117,270 00
Materials used, blacksmith's and carpenter's work.....	70,155 16
Expense of engines and attendance.....	138,734 27
Total cost.....	\$326,162 43

Or, \$77.29 per foot lineal, exclusive of the cost of engines and machinery, which amounts to \$187,680.40.

One of the engines is intended to be used after the completion of the tunnel to operate the machinery for moving the cars on the railroad. The remainder, and a portion of the machinery can be sold, but Mr. Carlyle has made no deduction from his estimates on account of proceeds obtained from their sale.

In the annual report of the State Mineralogist of the State of Nevada, for 1866, page 93, it is stated that the cost of sinking the Bonner shaft of the Gould & Curry company, exclusive of cost of engines and machinery, was \$76,378.40; depth attained,

692½ feet; price per foot, \$109.36. The shaft consists of four compartments, five feet square, and is cribbed with 12-inch timbers. It is capable of working the mine to the depth of 1,200 feet.

This shaft is about double the size of those proposed for the Sutro Tunnel, and the actual cost per foot lineal is but 41½ per cent. greater. It would seem, from this experience, that the estimate for the cost of the shafts is sufficient.

We do not find any statements of the actual cost of constructed tunnels of great length and of as small dimensions as the one proposed by Mr. Sutro.

The Sapperton tunnel, on the Thames and Severn Canal, England, through rock partly lined with masonry, is 12,900 feet in length; sectional dimensions, 15 by 15 feet; cost, \$12.44 per foot lineal.

The Hare Castle tunnel, on the Trent and Mersey Canal, England, through rock and sand, lined throughout with masonry, is 8,778 feet in length; sectional dimensions, 14 by 16 feet; cost, \$57.05 per foot lineal.

The Blisworth tunnel, on the Grand Junction Canal, England, through rock and clay, lined throughout with masonry, is 9,240 feet in length; sectional dimensions, 16½ by 18 feet; cost, \$23.18½ per foot lineal.

Edge Hill tunnel, on the Liverpool and Manchester Railroad, Eng., through clay and freestone, partly lined with masonry, is 6,600 feet in length; sectional dimensions, 22 by 16 feet; cost, \$30.15 per foot lineal.

It will be noticed that the sectional area of all these tunnels is about twice that of the one proposed by Mr. Sutro.

The Nochotestengo tunnel, made in 1607, to drain Lake Zupango, in Mexico, is 21,659 feet in length, through clay and marl; its dimensions are 13.78 by 11.48 feet, and it was completed in 237 days. The maximum depth below the surface was but 164 feet. Cost not stated.

We could, if our limits permitted, give statements in relation to many large tunnels constructed on lines of railroads, within a few years, but we will conclude our remarks on this subject by submitting an extract from Gen. McClellan's memoranda of railroads:

"The Nerthe tunnel, near Marseilles, is 15,153 feet long; has twenty-four shafts, whose aggregate length is 7,589 feet, the deepest being 610 feet. It is in very hard limestone rock; is 29½ feet high by 26½ feet wide. The shafts are lined with masonry; a portion of the body of the tunnel is lined with masonry, one, two and three bricks thick; another portion is not lined at all. A semi-circular brick aqueduct, 4½ feet in diameter, runs the whole length of the tunnel under the floor. The time occupied in the construction is not stated.

"The cost of the Nerthe tunnel was as follows:

For mining the body of the tunnel.....	\$705,582 20
For mining the shafts.....	409,081 08
Masonry for the shafts.....	49,009 51
Lining for the body of the tunnel.....	\$25,711 18
Cost of aqueduct.....	10,607 10
Total cost of tunnel.....	\$1,299,450 87

"The average cost of excavating the shafts, which are nine feet ten inches in clear diameter, was \$43 per yard downward; the average cost of lining the shafts was \$19.40 per yard down. The deepest shafts cost, on the average, \$73 per yard down, completed.

"Cost of mining the body of the tunnel, \$139.76½ per running yard."

James Hayward, Civil Engineer, in his testimony before a committee of the Legislature of Massachusetts on the Hoosac tunnel, states that not more than five years were occupied in the construction of the Nerthe tunnel.

The sectional area of this tunnel, supposing the top to be a semi-circle, as is usual on railroads, is about 700 feet, or more than six times that of the Sutro tunnel.

These statements are given that those interested in such inquiries may institute a comparison between the cost of works which have been constructed with the one proposed by Mr. Sutro. In such a comparison, due allowance must, of course, be made for the difference between the cost of labor and material in Nevada and other countries.

After reviewing Mr. Carlyle's estimates as carefully as time would permit, we have come to the conclusion that liberal prices have been generally allowed for the several items of expenditure; but, taking into consideration the liabilities of interruptions from breaking of machinery and irruptions of water, to which works of this description are subject, it would be safer to add for such contingencies twenty-five per cent. to his estimates, making the whole cost about \$2,500,000.

From a pamphlet published by Mr. Sutro in New York, in September last, we learn the following facts:

The Legislature of Nevada, in February,

1865, granted to A. Sutro the exclusive right for fifty years to run a tunnel from the foot hills to the Comstock lode, leaving the rates to be paid by the mining companies open to voluntary agreement. Subsequently a contract was made with all the leading companies, by which they agreed to pay two dollars for every ton of ore extracted after the main tunnel is completed and actually drain the mines; or, if they are not drained, then after a lateral drift reaches under any mine; one dollar per ton for every ton transported through the tunnel, and twenty-five cents for each man to be transported through the tunnel, either in or out.

We understand from Mr. Sutro that these contracts are subject to the condition that he and his associates obtain subscriptions to the amount of \$3,000,000 in currency prior to the 1st of August, 1868. The mining companies have already subscribed between \$300,000 and \$400,000, as part of the above amount, to become binding when the residue is subscribed.

In July, 1866, the Government of the United States passed a bill which grants—

1st. The right of way through the public domain for seven miles on or along the Comstock lode, or any other lode which may be developed or discovered by the tunnel.

2d. The right to select one thousand two hundred and eighty acres of land at the mouth of the tunnel.

3d. The right or title to the mines for two thousand feet on each side of the tunnel, equal to five thousand and eighty acres of mining land.

4th. It makes all the mines of the Comstock lode, or any other lode benefited by the tunnel, tributary to the same, and compels the owners of all those mines to pay to the Tunnel company the same rates of charges as agreed upon in the above mentioned contracts, and makes their title subject to that condition.

The aggregate income of the Tunnel company from the various sources, taking the yield of the mines to be 1,500 tons daily, is \$7,200 per day, or about \$2,500,000 per annum. The yield of the mines, however, is expected to be largely increased after the completion of the tunnel, which would double or treble the income of the company.

A number of mines have been located east of the Comstock lode, which show fair prospects on the surface and may be valuable in depth.

The land of the Tunnel company will also prove of high value, for whenever the tunnel is completed, a settlement will spring up at its mouth, as the mines must be entered and worked from that point.

The evidence adduced by Mr. Sutro in the pamphlet referred to (copies of which are on the tables of the Institute), must be sufficient to satisfy any one who will take the pains to examine the subject, that the capital invested in the enterprise must yield a large revenue. When it is recollected that the annual produce of these mines is about four-tenths of the whole yield of the precious metals in the States of Nevada and California, and that the prosperity of San Francisco is largely dependent upon the mineral resources of the country, we must conclude that every merchant, mechanic, manufacturer and land-holder in this city is deeply interested in the project.

In this connection the committee would call your attention to a letter to Mr. Sutro, dated October 5th, 1866, and signed by Moses Taylor, Peter Cooper, August Belmont, Eugene Kelly, R. C. Ferguson, Wm. T. Coleman, C. K. Garrison, Duncan, Sherman & Co., and other leading capitalists of New York. This letter is found in the pamphlet on the Sutro Tunnel, to which reference has been previously made.

"If the mining companies on the Comstock lode, and the people of Nevada and California, who are familiar with the value of your mines, would evince their confidence in the enterprise by subscribing a portion of the requisite capital—say four or five hundred thousand dollars—and work on the tunnel is actually commenced, we think you will find it comparatively an easy task to obtain the balance of the funds here.

"We would consequently advise you not to lose any valuable time in futile attempts here or in Europe, where, no doubt, the same objections will be raised, but to return at once to San Francisco, and use your efforts there to get the work started."

That it is both the duty and the interest of the people of San Francisco to aid this enterprise by such contributions as shall secure its success, is too evident to need further illustration or enforcement.

The committee recommend the adoption of the following resolutions, embodying a summary of the views expressed in the preceding report:

#### RESOLUTIONS.

First.—That the Comstock lode is a vein

of extraordinary value, presenting every feature of permanency and continuance in depth, much further than mining works can ever be carried.

Second.—That experience in all countries shows conclusively that the difficulties in drainage and ventilation limit the depth to which mines can be worked, and whenever attempts have been made to work them below this limit, without the aid of adits or tunnels, the result has been disastrous to the owners.

Third.—That the proposed tunnel will, by affording good ventilation, diminish the temperature and greatly improve the sanitary condition of the miners.

Fourth.—That the Comstock lode must have a drain tunnel, or the mines must be eventually abandoned.

Fifth.—That the proposed Sntro Tunnel is a work entirely feasible, and offers no unusual mechanical difficulties whatever, and we believe it can be constructed, with proper energy, judicious management, and a sufficiency of capital, in from three and a half to four years, at a cost of about \$2,500,000. But were a work required of such magnitude as to cost \$10,000,000, necessity would demand its construction.

Sixth.—That the rights granted to the Tunnel company, the contracts made with the mining companies, and the chances of discovering valuable mines, make this enterprise one of the most promising undertakings ever projected on this coast, and offers extraordinary inducements for the investment of capital.

Seventh.—That by means of this tunnel a permanence and importance will be given to the mines on the Comstock lode which can hardly be realized now; that the produce of hollion from the mines may be doubled, and even trebled, exercising a most beneficial influence upon the commerce, the industry and resources of San Francisco.

Eighth.—That every citizen of California and this coast at large, who has the future welfare of the Pacific States at heart, should lend a helping hand, and encourage in every way and manner the execution of this great work.
